Fabric OS Command Reference	53-0000519-08		March 2004
Fabric OS Command Reference	53-0000519-08 Rev. A		April 2004
Fabric OS Command Reference	53-0000519-09		September 2004
Fabric OS Command Reference	53-0000519-10		April 2005
Fabric OS Command Reference	53-0000519-12		July 2005
Fabric OS Command Reference	53-1000240-01		September 2006
Fabric OS Command Reference	53-1000436-01		June 2007
Fabric OS Command Reference	53-1000599-01	Added 13 new commands. Updated 23 commands with new options in support of v6.0. Removed 46 obsolete commands. Edited and revised ~ 150 commands. Added command syntax conventions to Preface. Updated FCS, standby CP, and RBAC tables. Added AD Type to RBAC table (Appendix A). Removed licensed command tables and SupportShow reference. Cosmetic edits throughout.	October 2007
Fabric OS Command Reference	53-1000599-02	Added 9 new commands. Updated 28 commands to support new v6.1 functionality. Removed 6 operands from 6 commands. Corrected errors in ~150 commands. Updated Preface and RBAC/AD table (Appendix A). Cosmetic edits throughout.	March 2008

Document title	Publication number	Summary of changes	Publication date
Fabric OS Command Reference	53-1000599-03	Corrections and updates to 31 commands. Removed "Brocade Optional Features" from Preface. Added trademark note to Preface. Cosmetic edits throughout.	July 2008
Fabric OS Command Reference	53-1001115-01	Added 3 new commands to support Encryption. Modified 1 command. Updated Preface and RBAC/AD table.	August 2008
Fabric OS Command Reference	53-1001186-01	Added 14 new commands to support Logical Fabrics. Modified 63 commands with new command operands to support new Fabric OS v6.2.0 features. Removed 8 deprecated commands. Miscellaneous edits to ~40 commands to correct edits, update examples. Removed standby CP command table. Updated Preface, surrounding chapters, and command availability tables.	November 2008
Fabric OS Command Reference	53-1001337-01	Added 18 new commands. Modified 27 commands with new command operands to support new Fabric OS v6.3.0 features. Removed 6 deprecated command options. Removed 6 diagnostic commands that now require root access. Miscellaneous edits to ~100 commands to correct edits, update examples. Updated Preface, surrounding chapters, and permission tables.	July 2009
Fabric OS Command Reference	53-1001754-01	Updated 4 help pages with new command options. Modified 16 help pages for minor updates and corrections.	January 2010
Fabric OS Command Reference	53-1001764-01	Added 8 new commands. Modified 41 commands with new operands to support Fabric OS v6.4.0 features. Removed 5 commands and 3 deprecated command options. Miscellaneous edits to ~100 commands to correct edits, update examples, etc. Updated Preface, surrounding chapters, and permission tables.	March 2010

Document title	Publication number	Summary of changes	Publication date
Fabric OS Command Reference	53-1002147-01	Added 20 new commands. Modified 102 commands to support Fabric OS v7.0.0 features. Removed 40 commands. 16 commands have deprecated command options. Miscellaneous edits to ~250 additional commands. Updated Preface, surrounding chapters, and permission tables.	April 2011
Fabric OS Command Reference	53-1002447-01	Added 2 new commands. Modified 19 commands to support Fabric OS v7.0.1 features. Removed 1 command. Updated Preface, surrounding chapters, and permission tables.	December 2011

How this document is organized

This document is organized to help you find the information that you want as quickly and easily as possible.

The document contains the following components:

- Chapter 1, "Using Fabric OS Commands," explains how to use the command line interface to manage a Brocade SAN and Brocade switches.
- Chapter 2, "Fabric OS Commands," provides command information.
- Chapter 3, "Primary FCS Commands," summarizes the subset of commands available when an FCS policy is enabled.
- Appendix A, "Command Availability," explains the Role-Based Access Control, as well as Virtual Fabric and Admin Domain restriction checks used to validate commands.

Supported hardware and software

This document includes updated information specific to new functionality introduced in Fabric OS v7.0.1. Table lists the hardware platforms supported in Fabric OS v7.0 release. ASIC names may be used in this document to distinguish between types of switches that share certain characteristics.

TABLE 1 Supported hardware for Fabric OS v7.0

Hardware Platform	Description	ASIC
Brocade 300	8 Gbit 16-port switch	Goldeneye 2
Brocade 5100	8 Gbit 32-port switch	Condor 2
Brocade 5300	8 Gbit 64-port switch	Goldeneye 2

TABLE 1 Supported hardware for Fabric OS v7.0 (Continued)

Hardware Platform	Description	ASIC
Brocade 5410	8 Gbit 12-port embedded switch	Goldeneye 2
Brocade 5424	8 Gbit 24-port embedded switch	Goldeneye 2
Brocade 5450	8 Gbit 24-port embedded switch	Goldeneye 2
Brocade 5460	8 Gbit 24-port embedded switch	Goldeneye 2
Brocade 5470	8 Gbit 16-port embedded switch	Goldeneye 2
Brocade 5480	8 Gbit 24-port embedded switch	Goldeneye 2
Brocade 6505	16 Gbit 24-port switch	Condor 3
Brocade 6510	16 Gbit 48-port switch	Condor 3
Brocade VA-40FC	8 Gbit 40-port switch	Condor 2
Brocade 7800 Extension switch	8 Gbit 16-FC ports, 6 GbE ports	Goldeneye 2
Brocade 8000 FCoE switch	8 Gbit 16-FC port, 10 GbE 8-Ethernet port switch	Anvil/Condor 2
Brocade Encryption Switch	8 Gbit 16-port encryption switch	Condor 2

NOTE

The FR4-18i router blade cannot coexist with the Brocade FX8-24 in the same chassis.

Although Brocade supports and tests many different software and hardware configurations for Fabric OS v7.0.1, documenting all possible configurations and scenarios is beyond the scope of this document.

This document is specific to Fabric OS v7.0.1. To obtain information about an OS version other than v7.0.1, refer to the documentation for that OS version.

What is new in this document

The Fabric OS Command Reference v7.0.1Command supports the current Fabric OS release and the new hardware platforms.

New commands

The following commands and associated man pages have been added since the publication of the Fabric OS v7.0.0 release of this manual:

- appLoginHistory Displays login history for external applications. The command was introduced in Fabric OS v6.4.0, but did not have a help page.
- rtLogTrace Enables and displays real-time trace logs.

Modified commands

The following commands and associated man pages have been modified to support new hardware introduced in Fabric OS v7.0.1:

- perfTTmon Added new operands to delete all or stale Top Talker monitors (--delete [[slot/]port | -all | -sconfig]) and a help function.
- portCfg fciptunnel New --ficon -print option to configure FICON printer emulation.
- portCfgCompress Not supported on the Brocade 6505 and on the Brocade FC8-32E and FC8-48E port blades.
- portCfgDPort- Not supported on the Brocade FC8-32E and FC8-48E port blades.
- portCfgEncrypt Not supported on the Brocade 6505 and on the Brocade FC8-32E and FC8-48E port blades.
- portCfgEXPort New Network OS interop mode option -m 5.
- portCfgOctetSpeedCombo Not supported on the Brocade 6500; supported on the Brocade FC8-32E and FC8-48E port blades only with the default combination.
- portShow xtun New --ficon -printperf command to display emulated printer performance.
- **slotShow** Support for the Brocade FC8-32E and FC8-48E port blades. Clarified the description of slot 5 in a DCX and in a DCX-4S and the description of the **-p** parameter.

The following commands and associated man pages have been corrected or updated with additional information:

- bottleneckMon Added error message ID (RAS Cx-1018) to the description of the credit recovery feature.
- configure The edge hold time parameter has been corrected. For Fabric OS v7.0.0 and later, the parameter is by default enabled, and the default value is 220 milliseconds.
- configureChassis Documented system.i2cTurboCnfg parameter.
- cryptoCfg The Thales nCipher Key Appliance (NCKA) changed to Thales Encryption Manager for Storage (TEMS). Added new key vault support for IBM Tivoli Key Lifecycle Manager (TKLM). Updated master key export example.
- fcrLsanMatrix Clarified description of FCR matrix, updated examples.
- portLedTest The chassisDisable and chassisEnable commands must be used with this diagnostics.
- portLoopbackTest The chassisDisable and chassisEnable commands must be used with this diagnostics. Updated for 16 Gbps speed mode.

- roleConfig Roles are created with default classes ("localuserenvironment" and "nocheck") and default permissions (OM). A configuration download restores these defaults.
- supportSave If you use anonymous FTP to run supportSave on a chassis with multiple AP blades, configure the FTP Windows server to allow unlimited anonymous users.
- turboRamTest The chassisDisable and chassisEnable commands must be used with this diagnostics.

Deprecated commands

The following commands and associated man pages have been removed since this document was last released.

- fruReplace This command is no longer supported.
- portCfgVEXPort The McData Fabric legacy mode (-m 3) is no longer supported.

CLI usage conventions

- Some Fabric OS show commands display certain switch or fabric components in three-digit decimal numbers, for example, 003. When you use these numeric identifiers as inputs to other commands, you must remove the leading zeros; otherwise the commands will either fail or generate incorrect results. Adding zeros to any decimal number in a command input will cause that number to be treated as an Octal number.
- Automatic page breaks in CLI command output displays are being phased out. Use the more option
 to display command output with page breaks: command | more. Do not use the more option in
 conjunction with help pages. Executing help command | more will display a command "no manual
 entry for command" message.

Document conventions

This section describes text formatting conventions and important notices formats.

Text formatting

The narrative-text formatting conventions that are used in this document are as follows:

Identifies GUI elements

Identifies keywords and operands
Identifies text to enter at the GUI or CLI

italic text Provides emphasis

Identifies variables

Identifies paths and Internet addresses

Identifies document titles

Identifies syntax examples

For readability, command names in the command titles and in the narrative portions of this guide are presented in mixed letter case, for example, **switchShow**. In examples, command letter case is all lowercase.

Command syntax conventions

Command syntax in this document follows these conventions:

command Commands are printed in bold.

--option, option Command options are printed in bold.

-argument, arg Arguments are printed in bold.

[] Optional element.

variable Variables are printed in italics. In the help pages, values are <u>underlined</u> or

enclosed in angle brackets < >.

.. Repeat the previous element, for example "member[;member...]"

value Fixed (literal) values following arguments are printed in plain font. For example,

--show WWN

Boolean. Elements are exclusive. Example: **--show -mode** egress | ingress

Backslash indicates a "soft" line break. If a backslash separates two lines of a

command input, enter the entire command at the prompt without the backslash.

Notes, cautions, and warnings

The following notices and statements are used in this manual. They are listed below in order of increasing severity of potential hazards.

NOTE

A note provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

ATTENTION

An Attention statement indicates potential damage to hardware or data.

CAUTION

A Caution statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

DANGER

A Danger statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

Key terms

For definitions specific to Brocade and Fibre Channel, see the technical glossaries on the Brocade website. See "Brocade resources" on page xxiv for instructions on accessing the information.

For definitions of SAN-specific terms, visit the Storage Networking Industry Association online dictionary at:

http://www.snia.org/education/dictionary

Notice to the reader

This document may contain references to the trademarks of the following corporations. These trademarks are the properties of their respective companies and corporations.

These references are made for informational purposes only.

Corporation	Referenced Trademarks and Products
Commvault	Commvault Galaxy Data Protection

Getting technical help

Contact your switch support supplier for hardware, firmware, and software support, including product repairs and part ordering. To expedite your call, have the following information available:

- 1. General Information
 - Switch model
 - Switch operating system version
 - Error numbers and messages received
 - supportSave command output
 - Detailed description of the problem, including the switch or fabric behavior immediately following the problem, and specific questions
 - Description of any troubleshooting steps already performed and the results
 - Serial console and Telnet session logs
 - syslog message logs
- 2. Switch Serial Number

The switch serial number and corresponding bar code are provided on the serial number label, as shown here:

The serial number label is located as follows:

- Brocade 300, 5100, 5300, 7800, 8000, VA-40FC, 6505, 6510, and Brocade Encryption
 Switch—On the switch ID pull-out tab located inside the chassis on the port side on the left.
- Brocade 5410, 5424, 5450, 5460, 5470, 5480—Serial number label attached to the module.
- DCX, and DCX 8510-8—On the port side of the chassis, on the lower right side and directly above the cable management comb
- DCX-4S and DCX 8510-4—On the non-port side of the chassis on the lower left side.
- 3. Use the licenseldShow command to display the switch WWN.

If you cannot use the **licenseldShow** command because the switch is inoperable, you can get the WWN from the same place as the serial number, except for the Brocade *DCX*, *DCX-4S*, *DCX 8510-8*, and *DCX 8510-4*. On these models, access the numbers on the WWN cards by removing the Brocade logo plate at the top of the non-port side of the chassis.

Document feedback

Quality is our first concern at Brocade, and we have made every effort to ensure the accuracy and completeness of this document. However, if you find an error or an omission, or you think that a topic needs further development, we want to hear from you. Forward your feedback to:

documentation@brocade.com

Provide the title and version number and as much detail as possible about your issue, including the topic heading and page number and your suggestions for improvement.

Using Fabric OS Commands

In this chapter

•	Understanding Role-Based Access Control	•
•	Understanding Virtual Fabric restrictions	2
•	Understanding Admin Domain restrictions	3
•	Using the command line interface	4

Understanding Role-Based Access Control

Fabric OS implements Role-Based Access Control (RBAC) to control access to all Fabric OS operations.

Seven predefined roles are supported, as described in Table 2. These predefined role definitions are guided by perceived common operational situations and the operations and effects a role is permitted to have on a fabric and individual fabric elements.

TABLE 2	Role definitions
D.1	D.C.:

Role name	Definition
User	Non-administrative use, such as monitoring system activity. In Fabric OS v6.2.0 and later, the user account gains access to Fabric ID 128. This is the default logical fabric after a firmware upgrade.
Operator	A subset of administrative tasks typically required for routine maintenance operations.
SwitchAdmin	Administrative use excluding security, user management, and zoning.
ZoneAdmin	Zone management only.
FabricAdmin	Administrative use excluding user management and Admin Domain management.
BasicSwitchAdmin	A subset of administrative tasks, typically of a more limited scope and effect.
Admin	All administrative tasks, including encryption and chassis commands.
SecurityAdmin	Administrative use including admin, encryption, security, user management, and zoning.

In addition to these predefined roles, Fabric OS v7.0.0 and later provides support for creating user-defined roles. Refer to the **roleConfig** command for more information.

Appendix Appendix A, "Command Availability," explains the standard Role-Based Access Control checks in place to validate command execution, and provides the RBAC permissions for the commands included in this manual. Alternately, you can use the **classConfig** command to display the RBAC permissions for any specified command or meta-object format (MOF) class. Refer to the **classConfig** command for more information.

Additional command restrictions apply depending on whether Virtual Fabrics or Admin Domains are enabled in a fabric.

NOTE

Virtual Fabrics and Admin Domains are mutually exclusive and are not supported at the same time on a switch. To use Admin Domains, you must first disable Virtual Fabrics; to use Virtual Fabrics, you must first delete all Admin Domains. Use **ad --clear-f** to remove all Admin Domains. Refer to the *Fabric OS Administrator's Guide* for more information.

Understanding Virtual Fabric restrictions

All Fabric OS commands are subject to additional RBAC enforcement with regard to Virtual Fabric contexts and switch types. Commands can be executed in one or more of the contexts described in Table 3. Execution of chassis commands requires chassis permissions.

TABLE 3 Virtual Fabric contexts

Context type	Definition	
Switch context	Command applies to the current logical switch only, or to a specified logical switch.	
Chassis context	Command applies to the chassis on which it is executed.	
Switch and chassis context	Command can be executed in a logical switch context or in a chassis context.	
Disallowed	Command is not supported in Virtual Fabric mode.	

Switch commands are further defined by the switch type restrictions as described in Table 4. Switch type restrictions are not applicable to commands that require chassis permissions.

TABLE 4 Switch types

Switch tune	<i>7</i> 1
Switch type	Definition
All Switches	Command can be executed in any switch context.
Base Switch Only	Command can be executed only on the base switch.
Default Switch Only	Command can be executed only on the default switch.
N/A	Command is a chassis command or not supported in Virtual Fabric mode.

In a Virtual Fabric environment where contexts are enforced, the following Virtual Fabric restrictions apply to the RBAC permissions specified in Table 2. Refer to the **userConfig** command for more information on configuring user account access permissions in a Virtual Fabric environment.

- Any given role is allowed to execute all switch commands to which the role is authorized in the
 account's home context. The default home context is the default logical fabric FID 128.
- You can change an account's home context to a specified FID and configure the account permissions to access additional logical switches specified in the user's Fabric ID list.
- Accounts with user or admin permissions can be granted chassis permissions. A user account with
 the chassis role can execute chassis-level commands at the user RBAC access level. An admin
 account with the chassis role can execute chassis-level commands at the admin RBAC access
 level.

Refer to Appendix Appendix A, "Command Availability," for context and switch type information as it applies to CLI commands.

Understanding Admin Domain restrictions

A subset of Fabric OS commands is subject to Admin Domain (AD) restrictions that may be in place. In order to execute an AD-restricted command on a switch or device, the switch or device must be part of a given Admin Domain, and the user must be logged in to that Admin Domain.

Six Admin Domain types are supported, as defined in Table 5.

TABLE 5	AD types	
AD Ttpe		Definition
Allowed		Allowed to execute in all ADs.
PhysFabricOnl	y	Allowed to execute only in AD255 context (and the user should own access to AD0-AD255 and have admin RBAC privilege).
Disallowed		Allowed to execute only in AD0 or AD255 context; not allowed in AD1-AD254 context.
PortMember		All control operations allowed only if the port or the local switch is part of the current AD. View access allowed if the device attached to the port is part of current AD.
AD0Disallowed	I	Allowed to execute only in AD255 and AD0 (if no ADs are configured).
AD0Only		Allowed to execute only in AD0 when ADs are not configured.

Refer to Appendix Appendix A, "Command Availability," for a listing of Admin Domain restrictions that apply to the commands included in this manual.

Using the command line interface

The Fabric OS command line interface (CLI), accessed via Telnet, SSH, or serial console, provides full management capability on a Brocade switch. The Fabric OS CLI enables an administrator to monitor and manage individual switches, ports, and entire fabrics from a standard workstation. Selected commands must be issued from a secure Telnet or SSH session.

Access is controlled by a switch-level password for each access level. The commands available through the CLI are based on the user's login role and the license keys used to unlock certain features.

The Fabric OS CLI provides the following capabilities:

- Access to the full range of Fabric OS features, given the license keys installed.
- Assistance with configuration, monitoring, dynamic provisioning, and daily management of every aspect of storage area networks (SANs).
- A deeper view of the tasks involved in managing a Brocade SAN.
- Identification, isolation, and management of SAN events across every switch in the fabric.
- Management of Brocade licenses.

The documentation for each command includes a synopsis of its syntax, a description of command use, and a set of examples. The same information can be accessed by issuing the **help** command, followed by the command name on a Brocade switch or director. This command displays the help page for the specified command. For example, to display the help page for **portCfg**, enter:

switch:admin> help portCfg

Fabric OS Commands

aaaConfig

Manages RADIUS and LDAP configuration information.

SYNOPSIS aaaconfig

aaaconfig --show

aaaconfig --add | --change server -conf radius | Idap
 [-p port] [-d domain] [-t timeout] [-s secret]
 [-a chap | pap | peap-mschapv2]

aaaconfig --remove server -conf radius | Idap

aaaconfig --move server -conf radius | Idap to_position

aaaconfig --authspec aaa1[;aaa2 [-backup] [-nologout]

aaaconfig --help

DESCRIPTION

Use this command to manage the RADIUS and LDAP server configuration for the authentication, authorization and accounting (AAA) services. Use this command to display, add, remove, change, enable or disable the RADIUS or LDAP configuration.

Brocade switches use a local as well as a remote authentication mechanism for validating a login. Supported authentication protocols include Password Authentication Protocol (PAP), Challenge-Handshake Authentication Protocol (CHAP) and Protected Extensible Authentication Protocol (PEAP). In addition, Fabric OS v6.0.0 and later provides support for Light-weight Directory Access Protocol (LDAP) authentication against Active Directory for user authentication and authorization.

RADIUS or LDAP servers are contacted in the order they appear in the configuration list. The first server returning authentication success or failure causes the authentication request to succeed or fail. If no response is received within the specified timeout, the next RADIUS or LDAP server in the list is contacted. An event entry logs if all RADIUS or LDAP servers fail to respond.

When the command succeeds, it triggers an event log (the Fabric OS error log) to indicate a server is added, removed, or modified. Refer to the *Fabric OS Message Reference* manual for specific details.

There are two modes of operation in LDAP authentication, FIPS mode and non-FIPS mode. However, there is no option to configure LDAP while the switch is in FIPS mode. The LDAP client checks if FIPS mode is set on the switch and uses FIPS-compliant TLS ciphers for LDAP. If FIPS mode is not set and the ADir server is configured for FIPS ciphers, it uses FIPS-compliant ciphers.

Configuration changes are persistently saved and take effect with the next AAA request. The configuration applies to all switch instances in a platform supporting multiple switch domains.

NOTES

Customers can use centralized RADIUS servers to manage AAA services for a switch, as defined in the RFC 2865 RADIUS specification.

This command can be executed when logged in through the console, Telnet or SSH connection.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

server

Specifies an IP address or a server name in dot-decimal notation. IPv6 addresses are supported. If a name is used, a DNS entry must be correctly configured for the server. If the specified server IP address or name already exists in the current configuration, the command fails and generates an error. However, the command does not validate the server name against the IP address in the configuration. Make sure to avoid duplicate configuration of the same server, one specified by the name, the other specified by the IP address.

--show

Displays the current AAA service configuration.

--add | --change server [options]

Adds or modifies a RADIUS or LDAP server. The **--add** option appends the specified server to the end of the current configuration list. A maximum of 5 servers are supported for each authentication type. The **--change** option modifies the specified server configuration to use the new arguments. The server must be one of the IP addresses or names shown in the current configuration.

The following options are supported:

-conf radius | Idap

Specifies the server configuration as either RADIUS or LDAP. This operand is required.

The following operands are optional:

-p port

Specifies the RADIUS or LDAP server port number. Supported range is 1 to 65535. The default port is 1812 for RADIUS authentication. The default port is 389 for LDAP authentication. This operand is optional. If no port is specified, the default is used.

-t timeout

Specifies the response timeout for the RADIUS or the LDAP server. The supported range is 1 to 30 seconds. The default is 3 seconds. This operand is optional. If no timeout is specified, the default is used.

-d domain

Specifies the Windows domain name for the LDAP server, for example, brocade.com. This option is valid only with the **-conf Idap** option. This operand is required.

-s secret

Specifies a common secret between the switch and the RADIUS server. The secret must be between 8 and 40 characters long. This option is valid only with the **-conf radius** option, and it is optional. The default value is **sharedsecret**.

-a

Specifies the remote authentication protocol for the RADIUS server. This operand is valid only with the **-conf radius** option, and it is optional. The default value for this operand is **CHAP**.

Note that the distinction between protocols is only applicable to the packets between a system and the RADIUS server. To authenticate a user to the system, a password is always used.

Valid protocols are one of the following:

pap

Password Authentication Protocol

chap

Challenge-Handshake Authentication Protocol

peap-mschapv2

Protected Extensible Authentication Protocol (requires Fabric OS v5.3.0 or later)

--remove server

Removes the specified server from the configuration. The server must match one of the IP addresses or the names shown in the current configuration. The following operand is required:

-conf radius | Idap

Specifies the server configuration as either RADIUS or LDAP. If the server is enabled, the command does not allow the last server to be removed from the configuration list. RADIUS or LDAP must first be disabled before the last server of the specified type may be removed.

--move server option

Moves the specified server from the current position in a RADIUS or LDAP configuration list to the specified position. If the specified position is the same as the current position, no change takes place. Valid *options* include the following:

-conf radius | Idap

Specifies the server configuration as either RADIUS or LDAP. This operand is required.

to_position

Specifies the new position for the server. The value for to_position is an integer, and must be within the range of server positions in the current configuration. Use the **--show** option to determine current server positions. This operand is required.

--authspec "aaa1[;aaa2" [-backup] [-nologout]

Replaces the configuration with the specified AAA service. Each service can be specified only once in the list, for example, "radius; local; radius" is invalid. No edit option is provided. The **--authspec** option takes as an argument a semicolon-separated list of AAA services. Services must be enclosed in double quotation marks.

The following AAA services and service pairs are valid:

"local"

Default setting. Authenticates the user against the local database only. If the password does not match or the user is not defined, the login fails.

"radius"

When "radius" is specified, the first RADIUS server is contacted. If the RADIUS server is not reachable, the next RADIUS server is contacted. If the authentication fails, the authentication process does not check for the next server in the sequence.

"ldap"

When "Idap" is specified, the first Active directory (AD) server is contacted. If the AD server is not reachable, the next AD server is contacted. If the authentication fails, the authentication process does not check for the next server in the sequence.

"radius;local"

Enables the current RADIUS configuration as the primary AAA service and the switch-local database as the secondary AAA service. If "radius" and "local" are specified, and if the RADIUS servers are reachable and the user credentials are correct, the user authentication succeeds. If the user provides credentials from the switch database, the RADIUS authentication fails but login succeeds through the switch database.

"Idap:local"

Enables the current LDAP configuration as the primary AAA service and the switch-local database as the secondary AAA service. If "Idap" and "local" are specified, and if the AD servers are reachable and the user credentials are correct, the user authentication succeeds. If the user provides credentials from the switch database, AD authentication fails but login would still succeed through the switch database.

-backup

For use with the "radius;local" and "Idap;local" options only. The backup option states to try the secondary AAA service only if none of the primary AAA services are available.

-nologout

If **-nologout** is not specified, a change in the authentication mechanism may result in the termination of existing sessions. All existing sessions are terminated if the new authentication mechanism is one of the following: RADIUS only, LDAP only, or Local. If **-nologout** is specified, there will be no effect on the existing sessions regardless of the chosen authentication mechanism.

--help

Displays the command usage.

EXAMPLES

To display the current RADIUS configuration:

```
switch:admin> aaaconfig --show
RADIUS CONFIGURATIONS
Position Server Port Secret Timeout(s) Auth-Protocol
    192.168.233.48 1812 sharedsecret 3
                                          CHAP
    192.168.233.44 1812 sharedsecret 3
                                          CHAP
                 1812 private
                                   5
                                          CHAP
    radserver
LDAP CONFIGURATIONS
 ______
LDAP configuration does not exist.
Primary AAA Service: Switch database
Secondary AAA Service: None
```

To move the RADIUS server "radserver" from position 3 to position 1:

```
switch:admin> aaaconfig --move radserver -conf radius 1
```

To configure the RADIUS server 192.168.233.48 as an LDAP server:

```
switch:admin> aaaconfig --change 192.168.233.48 \
-conf ldap -p 3002 -s newsecret -t 1
```

To add an AD/LDAP server to the configuration:

```
switch:admin> aaaconfig --add 194.72.68.335 \
-conf ldap -p 3002 -d brocade.com -t 1
```

To replace the AAA service with backup option:

```
switch:admin> aaaconfig --authspec "ldap;local" -backup
```

To change the authentication mechanism with the no logout provision:

```
switch:admin> aaaconfig --authspec radius -nologout
switch:admin> aaaconfig --show
RADIUS CONFIGURATIONS
Position : 1
Server : 172.20.1.68
. 1812
```

. 172.2 .ort : 1812 Secret : : testing123

Timeout(s): 3

Auth-Protocol: PEAP-MSCHAPv2

LDAP CONFIGURATIONS ===========

LDAP configuration does not exist.

Primary AAA Service: RADIUS Secondary AAA Service: None

SEE ALSO None

Manages Admin Domain operations.

               ad --validate [-i | [ad_id | [-m mode]]]
               ad --transabort
```

ad --transshow

DESCRIPTION

Use this command to manage Admin Domain operations.

This command follows a batched-transaction model. When executed with the **--activate**, **--add**, **--clear**, **--create**, **--deactivate**, **--delete**, **--remove**, **--rename** options, this command changes only the Defined Configuration in the transaction buffer. The **--save** option sends the changes made in the transaction buffer to all other switches and permanently saves the changes to the Defined configuration in persistent storage. The **--apply** option performs a save operation, sends a request to apply the Admin Domain configuration (as defined in the persistent storage), and then enforces the configuration locally.

The Admin Domain transaction buffer is linked to the current login shell and is lost on logout. Use the **--transshow** option to display the current Admin Domain transaction information.

Before creating Admin Domains, the default zone mode should be set to "No Access". To set the default zone mode to "No Access" execute the following command sequence:

```
switch:admin> ad --select AD0
switch:admin> defzone --noaccess
switch:admin> cfgsave
```

Refer to **defZone** help for more information.

All switches, switch ports and devices in the fabric that are not specified in any other Admin Domain are treated as implicit members of AD0. Members added to AD0 are called explicit members.

When a new Admin Domain is created, the members included in the new Admin Domain are automatically removed from the implicit member list of AD0. If the devices included in the new Admin Domain are already zoned in AD0, and if you want to move these devices from AD0 without any traffic disruption, do the following:

- 1. Add the devices to AD0's explicit member list using ad --add and ad--apply.
- 2. Create new ADs with the devices and execute ad --apply.
- 3. Select (or login to) the new Admin Domain and create a relevant zone configuration and zones (Refer to **zone --copy** help for details). Enable the new zone configuration under the Admin Domain.
- (Optionally) remove explicit members from AD0 (using ad --remove and ad --apply). Remove the member references from the AD0 zone database.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The generalized syntax for this command is "ad action arguments". Command actions are described first. Argument details follow the description of actions.

The following actions are supported:

--activate arg

Activates an Admin Domain. An Admin Domain is enforced only if it is in an activated state. AD0 is always in an activated state. By default, after the Admin Domain is enabled, the devices specified in the Admin Domain are not able to see each other until they are zoned together. The command prompts for confirmation. The activate operation remains in the transaction buffer until you issue **ad --apply** or **ad--save**.

--add arguments

Adds new members to an existing Admin Domain. The add operation remains in the transaction buffer until you issue **ad --apply** or **ad --save**.

--apply

Saves the current transaction buffer contents to the defined configuration and enforces the defined configuration on all switches in the fabric. **ad --apply** prompts for confirmation.

--clear [-f]

Deletes all ADs and clears AD0's explicit members. This command fails if AD1 through AD254's zone databases are not empty. The command prompts for confirmation before deleting all Admin Domains. The clear operation remains in the transaction buffer until you issue **ad --apply** or **ad --save**.

When used with the **-f** option, this command deletes all ADs and clears all explicit members from AD0, even if the zone databases or AD1 through AD254 are not empty. Use the force option to remove Admin Domains before enabling Virtual Fabrics.

--create arguments

Creates a new Admin Domain with optionally specified device or switch members. A newly created Admin Domain is in an activated state. It initially contains no zone database. The newly created Admin Domain remains in the transaction buffer until you issue **ad --apply** or **ad --save**. AD0 always exists. Use **ad --add** to add explicit members to AD0.

--deactivate arg

Deactivates an Admin Domain. This operation fails if an effective zone configuration exists under the Admin Domain. This operation is not allowed on AD0. **ad --deactivate** does not disable any ports. Existing logins to a deactivated Admin Domain are not terminated; however, subsequent CLI execution is disallowed. A message is displayed to indicate that the current Admin Domain is not active. The command prompts for confirmation. The deactivate operation remains in the transaction buffer until you issue **ad --apply** or **ad --save**.

--delete arg

Deletes an Admin Domain. This command succeeds regardless of whether the Admin Domain is in a deactivated or an activated state. AD0 always exists; using this operation on AD0 does not delete AD0, it only removes all explicit members from AD0. The AD0 zone database does not need to be empty for the delete operation to succeed. Not all existing user sessions to a deleted Admin Domain are terminated; however, subsequent CLI execution is disallowed. A message displays indicating that the current Admin Domain is not active. The command prompts for confirmation before executing the delete action. The delete operation remains in the transaction buffer until you issue ad --apply or ad --save.

--exec arguments

This command performs the following tasks:

- Creates a new shell.
- Executes ad --select to the specified Admin Domain.
- Executes the specified commands.
- Exits the shell.

--remove arguments

Removes one or more members from an Admin Domain. Removing the last member from an Admin Domain deletes the Admin Domain. The remove operation remains in the transaction buffer until you issue **ad --apply** or **ad --save**.

--rename arguments

Renames the specified Admin Domain. If a reserved name is used for *new_ad_id* (AD number format), the operation fails if the reserved name does not correspond to the *ad_id* AD number. The rename operation remains in the transaction buffer until you issue **ad --apply** or **ad --save**.

--save

Saves the outstanding Admin Domain transaction to the defined configuration on all switches in the fabric. The saved Admin Domain definition is enforced only when **ad --apply** is issued. Attempts to modify and save an Admin Domain that is currently enforced will fail. The command prompts for confirmation.

--select arg

Selects an Admin Domain context. This command fails if the corresponding Admin Domain is not activated. This operation succeeds only if you have the specified Admin Domain. This command internally spawns off a new shell within the requested Admin Domain context. Type **logout** or **exit** to exit from the selected Admin Domain. The zone transaction is linked to the current shell; therefore, the zone transaction buffer is lost on logout. Use **cfgTransShow** to display the current zoning transaction information.

--show arguments

Displays the membership information of the specified Admin Domain or all Admin Domains.

When executed in an AD255 context and an Admin Domain name is not specified, all information about all existing Admin Domains is displayed. When executed in an AD0-AD254 context, the command, by default, displays the members of the current Admin Domain's effective configuration, and therefore you cannot specify an *ad id* or *mode*.

When executed in an AD255 context, all Admin Domain information from the transaction buffer, defined configuration and effective configuration is displayed.

--validate arguments

Checks whether Admin Domain members are from a non-Admin Domain aware switch or the members do not exist in the fabric. The output is similar to **ad --show**; however, all members that are from non-Admin Domain aware switches are marked with a plus sign (+). Members that are not online are marked with an asterisk (*).

FC Router Front Phantom Domain and FC Router Translate Phantom Domain are virtual entities without any exposed management interfaces; therefore, any FC Router phantom switch WWN specified in an AD switch member list is marked as a non-Admin Domain aware member. All **D,PI** members in the device list corresponding to an FC Router Phantom Domain are marked as non-Admin Domain aware members. All FC Router imported devices in the AD device list are marked as AD-aware members.

--transabort

Aborts the transaction buffer. The command prompts for confirmation before aborting the transaction.

--transshow

Displays the ID of the current Admin Domain transaction and indicates whether or not the transaction can be aborted. The transaction cannot be aborted if it is an internal Admin Domain transaction.

The following arguments are supported with selected AD actions:

ad_id

Uniquely identifies an Admin Domain. An ad_id can be a name or a number.

name

An Admin Domain name can be up to 63 bytes, must begin with a letter, and can consist of letters, numbers, and underscore characters. The Admin Domain names with the format AD[0-255] are reserved for autoassigning Admin Domain names to Admin Domains created with an Admin Domain number. and can be assigned only to the corresponding Admin Domain. Using **ad --rename**, for example, in an attempt to assign a name of AD5 to an Admin Domain with ID not equal to 5 fails. Admin Domain names are case-sensitive.

number

An Admin Domain can be specified by a number. Valid values include 0 through 255. AD0 and AD255 are always active. AD0 cannot be specified with --activate, --deactivate or --delete actions. AD255 can be specified only with --exec, --show and --validate actions.

For all command iterations, with the exception of **ad --create**, the Admin Domain is specified either by a name or a number. For **ad --create**, both name and number can be specified: for example, **ad --create test_ad/10 -d "100,5; 100,1"**.

-d "dev_list"

Specifies the list of devices in an Admin Domain, in quotation marks. Separate each entry in the device list with a semicolon (;). Valid formats include the following:

D,PI

Uses existing zone *D,PI* member types. Benefits include the following:

- Grants port control and zoning on the switch port and the devices attached to that port.
- PI can be specified as a range; for example, D,[0 to 34]. The port index range is expanded and stored internally.
- The same *D,PI* members can be specified in more than one Admin Domain.

Device WWN

Uses traditional zone WWN member types. Benefits include the following:

- Supports node or port WWNs.
- End-device members, whose WWNs are used in an Admin Domain definition, need not be online when the Admin Domain is created (similar to a zoneCreate operation).
- Provides rights to zone the devices.
- Provides administrative view rights to the switch port the device is connected to.

-s "switch_list"

Specifies the list of switches in an Admin Domain. The list must be enclosed in quotation marks. Separate each entry in the switch list with a semicolon (;). Specify the switch in one of the following formats:

Switch WWN

World wide name of the switch.

Domain ID

Any switch member specified in Domain ID format is converted into a switch WWN-based on the current fabric information. Operations with switch list fail if the domain ID to switch WWN lookup fails.

Membership in an AD switch_list grants switch administrative operations such as switchDisable, switchEnable, reboot, ad, etc. on the switch. Ownership of a switch implicitly provides port control capability on all its ports, but no zoning control.

"command_list"

Specifies one or more commands to execute in an Admin Domain context. This operand is valid only with the **--exec** option.

new_ad_id

Specifies a new Admin Domain name or number. This operand is valid only with the --rename option. Format is the same as *ad_id*.

-i

Displays the implicit members of AD0. This operand is valid only with the **--show** option.

-m mode

Specifies the mode in which Admin Domain configuration information is displayed. This operand is valid only with **--show** and **--validate**. Valid values for *mode* include the following:

0

Displays the Admin Domain configuration in the current transaction buffer.

1

Displays the Admin Domain configuration stored in persistent memory (defined configuration).

2

Displays the currently enforced Admin Domain configuration currently enforced (effective configuration).

EXAMPLES To enable AD5:

```
switch:admin> ad --activate 5
You are about to activate a new admin domain.
Do you want to activate '5' admin domain \
    (yes, y, no, n): [no] y
```

To enable AD_13:

```
switch:admin> ad --activate AD_13
```

To add new device members to AD1:

```
switch:admin> ad --add AD1, -d "100,5; 4,1"
```

To apply all changes made to the Admin Domain configurations since --apply was last executed:

```
switch:admin> ad --apply
You are about to enforce the saved AD configuration.
This action will trigger ad --apply to all switches \
in the fabric.
Do you want to apply all admin domains \
(yes, y, no, n): [no] y
```

To clear all Admin Domain definitions:

```
switch:admin> ad --clear
You are about to delete all ADs definitions.
This operation will fail if zone configurations \
exists in AD1-AD254
Do you want to clear all admin domains \
(yes, y, no, n): [no] y
```

To create an Admin Domain with a mix of D,PI, WWNs, and zone alias device members (two different methods shown):

```
switch admin> ad --create "AD1", \
    -d "100,5; 1,3; 20:00:00:e0:8b:05:4d:05"

switch admin> ad --create 1, \
    -d "100,5; 1,3; 21:00:00:e0:8b:05:4d:05"
```

To create an Admin Domain with two switches identified by domain ID and switch WWN:

```
switch:admin> ad --create "AD1", \
    -s "100; 10:00:00:60:69:80:59:13"
```

To create an Admin Domain with a device list and a switch list:

```
switch:admin> ad --create "AD1", \
    -d "100,5; 1,3; 21:20:00:00:e0:8b:05:4d:05" \
    -s "100; 10:00:00:60:69:80:59:13"
```

To deactivate Admin Domain 5:

```
switch:admin> ad --deactivate 5
You are about to deactivate an AD.
This operation will fail if an effective zone \
configuration exists in the AD
Do you want to deactivate '5' admin domain \
(yes, y, no, n): [no] y
```

To delete AD13:

```
switch:admin> ad --delete 13
You are about to delete an AD.
This operation will fail if an effective zone \
configuration exists in the AD
Do you want to delete '13' admin domain \
(yes, y, no, n): [no] y
```

To execute **switchShow** in an AD7 context (using the current *user_id*):

```
switch:admin> ad --exec 7 "switchshow"
```

To rename Eng_AD to Eng_AD2:

```
switch:admin> ad --rename Eng_AD Eng_AD2
```

To rename AD 200 to Eng_AD200:

```
switch:admin> ad --rename 200 Eng_AD200
```

To rename a user-assigned Admin Domain name to a reserved Admin Domain name (this operation fails if **AD_test**'s AD number is not 200):

```
switch:admin> ad--rename AD_test AD200
```

To remove the devices 100,5 and 1,3 from AD1:

```
switch:admin> ad --remove "AD1", \
     -d "100,5; 1,3; 21:00:00:e0:8b:05:4d:05"
```

To remove the switch 100 from AD1:

```
switch:admin> ad --remove "AD1", -s "100"
```

To save any outstanding Admin Domain definition-related transaction buffer

```
switch:admin> ad --save
You are about to save the outstanding AD membership.
This action will only save the changes to Defined \
configuration.
Any changes made will be enforced only on ad --apply.
Do you want to save admin domains \
(yes, y, no, n): [no] y
```

To select a new Admin Domain context by specifying the AD number:

```
switch:admin> ad --select 12
```

To display all ADs:

switch:admin> ad --show
Current AD: 255 : AD255

Transaction buffer configuration:

no configuration

Defined configuration:

AD: 1: AD1 Active

Device WWN members: 21:00:00:80:e5:12:8b:37;

21:00:00:80:e5:12:8b:55;

Switch port members: 1,0; 1,1; 1,2; 1,3; 1,4; 1,5;

1,6; 1,7; 1,8; 1,9; 1,10; 1,11;

1,12; 1,13; 1,14; 1,15;

Switch WWN members: 10:00:00:60:69:00:02:53;

Effective configuration:

AD: 1: AD1 Active

DESCRIPTION

Use this command to perform the following Access Gateway management functions:

- Enable or disable Access Gateway mode.
- Display current configuration and state of AG.
- Configure and display F_Port to N_Port mapping.
- Configure and display N_Port failover and failback policies.
- Configure and display Port Group policy.
- Create or remove a Port group.

ag --reliabilitycountershow

- Enable or disable auto port configuration (APC) modes for a Port group.
- Get or set timeout value for fabric name monitoring.
- Display Port Groups and member N_Ports.
- Add or delete N_Ports in a Port group.
- Display all policies and their status.
- Enable or disable auto port configuration (APC) policy.
- Enable or disable preferred secondary N_Port policy.
- Enable, disable, and manage advanced device security (ADS) policy.
- Manage persistent ALPA mode.
- Manage device WWN to N_Port mappings.
- Manage device WWN to N_Port group mappings.
- Manage device WWN failover to N_Ports configured as preferred failover ports.
- Enable or disable device WWN mappings.
- Configure the reliability limit for the preferred N Port.

AG configuration changes are saved persistently as configuration keys. Use the **portCfgNPort** command to set a port as N_Port.

This command supports multiple configurations for mapping device logins to N_Ports for the purposes of load balancing and redistribution in the event of a fabric change. If multiple mappings are configured, the system considers the available mappings in a fixed order of priority to determine which of the available N_Ports should be assigned to the login request. The first eligible mapping is chosen in the order specified below.

- Device WWN to N_Port
- 2. Device WWN to N_Port Group
- 3. Automatic device WWN load balancing.
- 4. F_Port to N_Port
- 5. F_Port to N_Port Group

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

AG is supported only on selected Brocade hardware platforms. Refer to the *Access Gateway Administrator's Guide* for hardware support and AG configuration procedures.

In non-AG mode, only two actions are available: **--modeenable** and **--modeshow**.

OPERANDS

This command has the following operands:

--help

Displays the command usage.

--show

Displays the current configuration of the Access Gateway. This includes all N_Ports and F_Ports that are currently online, failover and failback settings as well as any online F_Ports that are currently mapped to N_Ports. Failover and failback policies are displayed as enabled (1) or disabled (0).

--modeshow

Displays the current Access Gateway operating mode of the switch as either enabled or disabled.

--modeenable

Enables Access Gateway mode on a switch. Long distance mode settings should be cleared for all ports on the NPIV edge switch to which the AG is connected. Otherwise, the NPIV switch port displays the long distance port type along with the F_Port.

--modedisable

Disables Access Gateway mode on a switch. After AG mode is disabled, the switch reboots automatically and comes online with default zone access set to "No Access". In order to merge the switch to a fabric, set the default zone to "All Access" and disable/enable the E_Port.

--policyshow

Displays the supported AG port policies and their status as either enabled or disabled. AG supports four types of policies:

- Port Grouping (pg) policy: This policy manages failover of an F_Port to a set of related N_Ports in a port group.
- Auto Port Configuration (auto): When this policy is enabled, the AG enabled switch automatically detects available ports and maps F_Ports to N_Ports.
 Auto port configuration is disabled by default.

- Advanced Device Security (ADS) policy. This policy restricts access to the
 fabric at the AG level to a set of authorized devices. Unauthorized access is
 rejected and the system logs a RASLOG message. You can configure the list
 of allowed devices for each F_Port by specifying their Port WWN. Refer to the
 ag --ads* commands for information on managing advanced device security.
 ADS policy is disabled by default, which means that all devices can connect
 to the switch.
- WWN Based Load Balancing policy: This policy routes device logins to the least loaded port in the port group to which they are mapped.

--policyenable policy

Enables the specified port policy for the Access Gateway. When a new policy is enabled, all port related configuration settings are lost. Use the **configUpload** command to save the current port configuration. Valid policies include the following:

pg

Enables the port grouping policy. A default port group "pg0" is created, which includes all configured N_Ports assigned to the policy. Enabling port grouping policy disables the Get Fabric Name policy.

auto

Enables the automatic port configuration policy. When enabled, this policy applies to all ports on the switch. All F_Port to N_Port mapping and port group configurations are ignored.

ads

Enables the advanced device security (ADS) policy. When enabled, this policy applies to all the ports on the switch. By default all devices have access to the fabric on all ports.

wwnloadbalance

Enables the device WWN load balancing policy. When this policy is enabled, device logins are sent to the least loaded port in the port group to which they are mapped. These devices are displayed with **ag --wwnmapshow** as dynamic device mappings. Port Group policy must be enabled before you can enable the WWN load balancing policy.

--policydisable policy

Disables the specified policy for the Access Gateway. When a policy is disabled, all port-related configuration settings are lost. Use the **configUpload** command to save the current port configuration. Valid policies include the following:

pg

Disables the port grouping policy. All port group configurations are deleted. Disabling port grouping policy enables the Get Fabric Name policy.

auto

Disables the automatic port configuration policy and deletes all associated configuration settings.

ads

Disables the advanced device security (ADS) policy and deletes all lists of allowed device WWNs.

wwnloadbalance

Disables the device WWN load balancing policy.

--mapshow [N_Port | device_WWN]

Displays the F_Ports that are configured and currently mapped to a given "primary" N_Port. Optionally specify an N_Port to display the F_Ports that are mapped to the specified N_Port only, or specify a device WWN to display the N_Port to which the device WWN is mapped. Failover and failback policies are displayed as enabled (1) or disabled (0).

--mapset N_Port [F_Port1;F_Port2;...]

Maps a set of F_Ports to a specified "primary" N_Port forcing all traffic from the F_Ports to be routed through this N_Port to the attached fabric. An F_Port cannot be mapped to more than one primary N_Port at any given time. F_Ports are enabled only if the N_Port is online. This command overwrites existing port mappings. Use a blank list ("") to clear current mappings.

--mapadd N_Port F_Port1 [; F_Port2;...]

Adds one or more specified F_Ports to the mapping of an existing "primary" N_Port. The traffic for the configured F_Ports is routed to the fabric through the specified N_Port when the F_Ports come online. An F_Port cannot be mapped to more than one primary N_Port at the same time.

--mapdel N_Port F_Port1 [; F_Port2;...]

Deletes one or more specified F_Ports from the "primary" N_Port mapping.

--staticadd N_Port F_Port1 [; F_Port2;...]

Creates a static mapping between an existing "primary" N_Port and one or more specified F_Ports. This command removes exiting mappings. Once the static mapping is enabled, the F_Ports and all logged-in devices will logout of the previous N_Port and login using the new N_Port.

--staticdel N_Port F_Port1 [; F_Port2;...]

Deletes a static mapping between an existing "primary" N_Port and one or more specified F_Ports. This command removes exiting mappings. Alternately, you can remove an existing mapping by mapping the F_Port to another N_Port.

--pgshow [pgid]

Displays the Port Group configuration. The port grouping feature supports specifying a set of N_Ports to be included in the Port Group (PG) Policy. The factory default PG is "pg0", which includes all N_Ports. The default PG cannot be removed or renamed.

--pgcreate pgid

"*N_Port1* [;*N_Port2*;...]" [-**n** pgname][-**m** "lb; mfnm"]

Creates a port group with the ID *pgid* and a specified list of N_Ports to be included in the policy. The list must be enclosed in quotation marks. Ports must be separated by semicolons. The Port Group ID must not exceed 64 characters. Optionally specify a name for the port group and a mode. Modes are by default disabled. For an explanation of mode values, refer to **--pgsetmodes**.

--pgadd *pgid* "*N_Port1* [; *N_Port2*;...]"

Adds one or more N_Ports to the specified port group. The port list must be enclosed in quotation marks. Ports must be separated by semicolons.

--pgdel *pgid* "*N_Port1* [; *N_Port2*;...]"

Deletes one or more N_Ports from the specified port group. Deleted ports are added to the default port group "pg0". The port list must be enclosed in quotation marks. Ports must be separated by semicolons.

--pgrename pgid newname

Replaces the name of an existing port group with the specified new name. The port group ID must not exceed 64 characters.

--pgremove pgid

Deletes the specified port group. The N_Ports in the port group that was deleted are moved to the default port group, which is *pgid* 0.

--pgmapadd pgid "F_Port1[;F_Port2;...]"

Maps the specified F_Ports to the PG identified by the *pgid*. Upon execution, the system identifies the least loaded N_Port in the port group and maps the F_Ports to that N_Port. The port list must be enclosed in double quotation marks. Ports must be separated by semicolons. Login balancing (LB) mode must be enabled on the port group for this command to succeed. Use **ag --pgsetmodes** to enable LB mode.

--pgmapdel pgid "F_Port1[;F_Port2;...]"

Removes one or more F_Ports that are part of the port group identified by the *pgid* from their mapping to a corresponding N_Port. The port list must be enclosed in double quotation marks. Ports must be separated by semicolons. Login balancing (LB) mode must be enabled on the port group for this command to succeed. Use **ag --pgsetmodes** to enable LB mode.

--pgsetmodes pgid "lb;mfnm"

Sets the APC modes for the specified port group. The mode list must be enclosed in double quotation marks and the modes must be separated by a semicolon. Alternately you can set the modes at the time when you create the port group with the **pgcreate** command. The following modes are supported:

lb

Specifies the login balancing mode for the specified port group. If login balancing mode is enabled and an F_Port goes offline, logins in the port group are redistributed among the remaining F_Ports. Similarly, if an N_Port comes online, port logins in the PG are redistributed to maintain a balanced N_Port to F_Port ratio. This operation is disruptive. Login balancing mode is disabled by default in all port groups.

mfnm

Enables the managed fabric name monitoring mode (MFNM) in the specified port group. This command changes the fabric name monitoring mode from "default" to "managed". In both default and managed mode, the system queries the fabric name once every 120 seconds, and if it detects an inconsistency, for example, if the port group is connected to multiple fabrics, it triggers a RASLOG message. The difference between default and managed fabric name monitoring is that in managed mode, failover is disabled for all ports in the port group if the system detects an inconsistency in fabric names.

MFNM is supported on the Brocade 8000 in Fabric OS v7.0.0 or later. You can add or remove MFNM from a port group, however, doing so will enable or disable MFNM on the entire switch. RASLOG messages are generated only if MFNM is enabled on the entire switch and multiple fabrics are connected to the switch.

--pgdelmodes pgid "lb;mfnm"

Disables the specified modes on a given port group. The mode list must be enclosed in double quotation marks and the modes must be separated by a semicolon. For a description of supported modes, refer to **--pgsetmodes**.

--pgfnmtov new_tov

Displays the fabric name monitoring timeout value in seconds when used without specifying a new value. To change the current value, specify a new timeout value in seconds. The valid range is 30 to 120 seconds. The default value is 120 seconds.

--failoverenable [N_Port] | -pg pgid

Enables the failover policy for a given N_Port or for all N_Ports in the given port group. When failover policy is enabled for a given N_Port, F_Ports behave as follows:

- If only primary F_Port to N_Port mapping is in place, all currently mapped F_Ports fail over to another available N_Port in the event the original N_Port becomes disabled. If multiple N_Ports are available for failover, F_Ports are evenly balanced across all available N_Ports. If no other N_Port is available, failover does not occur.
- If preferred secondary F_Port to N_Port Mapping is in place, the F_Ports are routed through the preferred Secondary N_Port. If the preferred secondary N_Port is offline, the F_Ports are disabled.

--failoverdisable [N_Port] -pg pgid

Disables the failover policy for a given N_Port or for all N_Ports in the given port group.

--failovershow [N_Port]

If an N_Port is specified (optional), the command displays the failover policy for this N_Port. Otherwise, the failover policy for all N_Ports is displayed. Failover is displayed as enabled (1) or disabled (0).

--failbackenable [N_Port] | -pg pgid

Enables the failback policy for a specified N_Port or for all N_Ports in the given port group. When failback policy is enabled, ports behave as follows:

- If only primary F_Port to N_Port mapping is in place, all F_Ports are automatically rerouted back to the N_Ports to which they were originally mapped as those N_Ports come back online. Only the originally mapped F_Ports fail back. In the case of multiple N_Port failures, only F_Ports that were mapped to the recovered N_Port experience failback. The remaining F_Ports are not redistributed among the online N_Ports during the failback.
- If preferred secondary F_Port to N_Port mapping is in place, and the primary N_Port comes back online, then the F_Ports are rerouted through the primary N_Port. If the secondary N_Port comes online, while the primary N_Port is still offline, F_Ports are rerouted through the secondary N_Port.

--failbackdisable [N_Port] | -pg pgid

Disables the failback policy for the specified N_Port or for all N_Ports in the given port group.

--failbackshow [N_Port]

If an N_Port is specified (optional), the command displays the failback policy for this N_Port. Otherwise, the failover policy for all the N_Ports is displayed. The failback policy is displayed as disabled (0) or enabled (1).

--prefset "F_Port [;F_Port2;...]" N_Port

Sets the preferred secondary N_Port for one or more F_Ports. Preferred mapping is optional. Preferred F_Port to N_Port Mapping provides an alternate N_Port for F_Ports to come online for predictable failover and failback. An F_Port must have primary N_Port mapping before a secondary N_Port can be configured. The list of F_Ports to be mapped must be enclosed in double quotation marks. Port numbers must be separated by semicolons.

--prefdel "F_Port [;F_Port2;...]" N_Port

Deletes the preferred Secondary N_Port for the specified F_Ports. The list of F_Ports to be deleted from the secondary mapping must be enclosed in double quotation marks. Port numbers must be separated by semicolons.

--prefshow

Displays the preferred Secondary N_Port for all F_Ports.

--adsset "F_Port [;F_Port2;...]" "WWN [;WWN2;...]"

Sets the list of devices that are allowed to login to a specified set of F_Ports. Devices are specified by their world wide names. Lists must be enclosed in double quotation marks. List members must be separated by semicolons. The maximum number of entries in the allowed device list is twice the per port maximum login count. Replace the WWN list with an asterisk (*) to indicate all access on the specified F_Port list. Replace the F_Port list with an asterisk (*) to add the specified WWNs to all the F_Ports' allow lists. A blank WWN list ("") indicates no access. ADS policy must be enabled for this command to succeed.

--adsadd "F_Port [;F_Port2;...]" "WWN [;WWN2;...]"

Adds the specified WWNs to the list of devices allowed to login to the specified F_Ports. Lists must be enclosed in double quotation marks. List members must be separated by semicolons. Replace the F_Port list with an asterisk (*) to add the specified WWNs to all the F_Ports' allow lists. ADS policy must be enabled for this command to succeed.

--adsdel "F_Port [;F_Port2;...]" "WWN [;WWN2;...]

Deletes the specified WWNs from the list of devices allowed to login to the specified F_Ports. Lists must be enclosed in double quotation marks. List members must be separated by semicolons. Replace the F_Port list with an asterisk (*) to remove the specified WWNs from all the F_Ports' allow lists. ADS policy must be enabled for this command to succeed.

--adsshow

Displays the list of allowed device WWNs for all F_Ports.

--persistentalpaenable 1 | 0 mode

Configures the persistent ALPA feature. Once enabled, the ALPA parts of all device PIDs become persistent regardless of whether they were logged in before or after the persistent ALPA feature was enabled. ALPA persistence ensures that there is no inconsistency between logged in devices. The persistent ALPA feature is disabled by default.

1 | 0

Specify 1 to enable persistent ALPA. Specify 0 to disable the feature.

mode

Specifies the manner in which the ALPA is obtained in the event that the ALPA value is already taken by another host. Valid modes include the following:

-s

Specifies a stringent ALPA request mode. In stringent mode, the login is rejected if the ALPA is not available.

-f

Specifies a flexible ALPA request mode. In flexible mode, the host login is accepted either with the requested ALPA value or with a different ALPA value if the requested ALPA is not available.

--printalpamap F_Port

Displays the database entry for the specified port. An F_Port must be specified. The output displays the PWWN-to-host-ALPA mapping.

--deletepwwnfromdb PWWN

Removes the specified port WWN entry from the database after the host has logged out.

--clearalpamap F_Port

Clears the ALPA values for the specific F_Port. This command removes the PWWN-to-ALPA-value mapping from the database.

--addwwnmapping N_Port "WWN [; WWN2;...]" | --all

Maps one or more device WWNs to a preferred N_Port. All traffic form the specified devices is forced through the specified N_Port, regardless of which F_Port the device logs into. In the event the designated N_Port should become unavailable, an alternate port can serve as a preferred failover port. This command only affects devices that are connecting to the fabric after successful execution of this command; it will not affect devices already logged in. If a device is already connected to the switch when its mapping is created, that mapping goes into effect the next time the device connects. The WWN list must be enclosed in double quotation marks. WWNs must be separated by semicolons.

The **--all** option indicates all device WWNs already mapped, for example, if you wish to change an existing WWN mapping. It does not affect device WWNs that are not part of an existing mapping.

--delwwnmapping N_Port "WWN [;WWN2;...]" | --all

Removes the mapping of one or more device WWNs to a preferred N_Port. The **--all** option removes the mapping for all device WWNs currently mapped to the specified N_Port. The WWN list must be enclosed in double quotation marks. WWNs must be separated by semicolons. The mappings are removed upon execution of this command.

--addwwnpgmapping PG "WWN [; WWN2;...]" | --all

Maps one or more device WWNs to any of the N_Ports included in the specified port group . The port group is identified by its port group ID. The --all option maps all currently mapped device WWNs to the specified port group. The WWN list must be enclosed in double quotation marks. WWNs must be separated by semicolons. The device WWN to port group mapping takes effect the next time the device logs in.

--delwwnpgmapping PG "WWN [; WWN2;...]" | --all

Removes the mapping between the specified device WWNs and the specified port group. The port group is identified by its port group ID. The --all option removes the mapping of all device WWNs currently mapped to the specified port group. The WWN list must be enclosed in double quotation marks. WWNs must be separated by semicolons. The mappings are removed upon execution of this command.

--addwwnfailovermapping N Port "WWN [; WWN2;...]" | --all

Maps one or more device WWNs to a preferred failover N_Port. If the N_Port to which the WWNS are mapped is not available or goes down, the device logins fail over to the preferred failover N_Port. The **--all** option maps all currently mapped device WWNs to the specified failover N_Port. The WWN list must be enclosed in double quotation marks. WWNs must be separated by semicolons.

--delwwnfailovermapping N_Port "WWN [; WWN2;...]" | --all

Deletes the mapping of one or more device WWNs to a preferred failover N_Port. The **--all** option deletes the failover mappings of all device WWNs currently mapped to the specified N_Port. The WWN list must be enclosed in double quotation marks. WWNs must be separated by semicolons.

--wwnmappingdisable "WWN [; WWN2;...]" | --all

Disables one or more device WWN mappings. Use this command if you want to disable the mapping action temporarily without making permanent changes to the mappings. The mappings remain disabled until they are re-enabled or deleted. The **--all** option disables all currently existing device WWN mappings.

--wwnmappingenable "WWN [; WWN2;...]" | --all

e-enables one or more previously disabled device WWN mappings. The **--all** option re-enables all previously disabled device WWN mappings.

--wwnmapshow

Displays all device WWN mappings. For each device WWN, the command displays the N_Port number to which it is mapped, the secondary (failover) N_Port, and the port group if applicable. The "Current" field shows the port the device is currently using. If the device is not logged in, the field displays "none." If the device is logged in to a port other than the one it is mapped to, the field displays that port. If the device is mapped to a port group, the field displays the number of the port within that port group that the device is currently using. If the device is using a trunk, the field displays which port in that trunk the device is logged in. The "Enabled" field indicates, whether a mapping has been temporarily disabled ("no"), or whether it is in enabled state ("yes").

--reliabilitycounterset count

Sets the reliability limit for the preferred N_Port. This parameter controls the number of ONLINE or OFFLINE State Change Notification (SCN) messages a port can receive before becoming unreliable. The range is 10 through 100. The default value is 25.

The port becomes reliable again if it does not receive any SCN messages for a period of five minutes. Preferred N_Port settings are not enforced on unreliable N_Ports. When the port becomes reliable again, the behavior is as follows:

- If a FAILBACK flag is set, the port will fail back the configured F_Ports.
- Configured F_Ports that are offline will come back online.
- If LB mode or auto policy is configured, load rebalancing resumes.

--reliabilitycountershow

Displays the configured reliability limit for N_Ports.

EXAMPLES AG show commands

To display the current state of the Access Gateway with Failover (FO) and Failback (FB) enabled on N Ports 9 and 12:

```
switch:admin> ag --show
    : switch_ST1
Name
NodeName
             : 10:00:00:05:1e:35:9b:e7

                                  1
```

To display the current Access Gateway mode:

```
switch:admin> ag --modeshow
Access Gateway mode is enabled.
switch:admin> ag --modeshow
Access Gateway mode is NOT enabled.
```

AG group policy commands

To show current policies:

```
switch:admin> ag --policyshow
                 Policy Name
AG Policy
                                       State
Port Grouping pg Enabled
Auto Port Configuration auto Disabled
Advanced Device Security ads Disabled
Advanced Device Security ads
WWN Based Load Balancing wwnloadbalance Disabled
_____
```

To enable a port grouping policy:

```
switch:admin> ag --policyenable pg
```

To disable a port grouping policy

```
switch:admin> ag --policydisable pg
```

To enable auto port configuration policy when both policies are disabled and the switch is already disabled:

```
switch:admin> ag --policyenable auto
All Port related Access Gateway configurations will be lost.
Please save the current configuration using configupload.
Do you want to continue? (yes, y, no, n): [no] y
```

To disable auto port configuration policy when the switch is disabled:

```
switch:admin> ag --policydisable auto
Default factory settings will be restored.
Default mappings will come into effect.
Please save the current configuration using configupload.
Do you want to continue? (yes, y, no, n): [no] y
Access Gateway configuration has been restored \
to factory default
```

To enable the ADS policy:

```
switch:admin> ag --policyenable ads
```

To disable the ADS policy:

```
switch:admin> ag --policydisable ads
```

To enable the WWN load balancing policy:

```
switch:admin> ag --policyenable wwnloadbalance
```

To disable the WWN load balancing policy:

```
switch:admin> ag --policydisable wwnloadbalance
```

AG port mapping commands

To display current port mappings and port grouping policies:

```
switch:admin> ag --mapshow
```

Explanation of fields in --mapshow output:

- Static F_Ports are part of as static F_Port to N_Port mapping.
- Current F_Ports are the F_Ports that are currently online and mapped to a given N_Port either because they are mapped to that N_Port or as a result of N_Port failover.
- Configured F_Ports are the F_Ports that are explicitly mapped to this N_Port (saved in config).
- Failover and Failback indicate whether or not N_Port policy is enabled (1) or disabled (0).
- PG_ID is the Port Group ID and PG_Name is the Port Group Name.

To clear all F_Ports mapped to the configured primary N_Port 0:

```
switch:admin> ag --mapset 0 ""
F_Port to N_Port mapping has been updated successfully
```

To add F_Ports 4 and 6 to N_Port 0 (observe that Port 0 has no configured F_Ports):

```
switch:admin> ag --mapset 0 "4;6"
F_Port to N_Port mapping has been updated successfully
```

```
To add F_Port 5 to N_Port 2 (observe that N_Port 2 already has mapped F_Ports):
```

```
switch:admin> ag --mapadd 2 "5"
```

To display the new mappings:

switch:admin> ag --mapshow

N_Port	Configured	Static	Current	Failover	Failback	PG_II) PG_Name
	_F_Ports	_F_Ports	F_Ports				
0	4;6	None	4;6	1	0	2 Sec	condFabric
1	7;8;9	None	7;8;9	0	1	0 pg()
2	5;10;11	None	5;10;11	1	0	2 Sec	condFabric
3	12;13	None	12;13	0	1	0 pg()

To delete F_Port 5 that was mapped to N_Port 2:

```
switch:admin> ag --mapdel 2 "5"
Preferred N_port is set for F_Port[s]
Please delete it before removing primary N_Port
ERROR:Unable to remove F_Port[s] from mapping,
retry the command
```

switch:admin> ag --prefshow

F_Ports	Preferred N_Port
10;11	0
4;5;6	2
7;8;9	3

switch:admin> ag --prefdel 5 2

```
Preferred N_Port is deleted successfully \
for the F_Port[s]
```

```
switch:admin> ag --mapdel 2 "5"
F_Port to N_Port mapping has been updated successfully
```

To create and display a static mapping:

```
switch:admin> ag --staticadd 17 1
```

switch:admin> ag --show

N Port information :

AG failover policy commands

To display failover policy settings for all N_Ports:

To set and display failover and failback policies on a single port:

```
switch:admin> ag --failoverenable 1
Failover policy is enabled for port 1
switch:admin> ag --failoverdisable 0
Failover policy is disabled for port 0
switch:admin> ag --failovershow 0
Failover on N_Port 0 is not supported
switch:admin> ag --failbackdisable 2
Failback policy is disabled for port 2
switch:admin> ag --failbackshow 2
Failback on N_Port 2 is not supported
switch:admin> ag --failbackenable 2
Failback policy is enabled for port 2
```

To display failback policy settings for all the N_Ports:

To set and display failback policy settings on a single port:

```
switch:admin> ag --failbackenable 0
Failback policy cannot be enabled since failover
policy is disabled for port 0
switch:admin> ag --failbackenable 2
Failback policy is enabled for port 2
switch:admin> ag --failbackenable 3
Failback on N_Port 3 is not supported
switch:admin> ag --failbackenable 2
Failback on N_Port 2 is supported
```

Port Group commands

To display Port Group information:

switch:admin> agpgshow					
PG_ID	PG_Name	PG_Mode	N_Ports	F_Ports	
0	pg0	lb,mfnm	1;3	10;11	
2	SecondFabric	_	0;2	4;5;6	

To create a port group "FirstFabric" that includes N_Ports 1 and 3 and has login balancing enabled:

```
switch:admin> ag --pgcreate 3 "1;3" -n FirstFabric1 -m "lb"
Port Group 3 created successfully
```

```
switch:admin> ag --pgshow
PG_ID PG_Name PG_Mode N_Ports F_Ports
0 pg0 lb,mfnm none none
2 SecondFabric - 0;2 4;5;6
3 FirstFabric lb 1;3 10;11
```

To rename the port group with pgid 2 to "MyEvenFabric":

```
switch:admin> ag --pgrename 2 MyEvenFabric
Port Group 2 has been renamed as MyEvenFabric successfully
```

	h:admin> ag - · PG_Name	-pgshow PG_Mode	N_Ports	F_Ports
0 2 3	pg0 MyEvenFabric FirstFabric	lb,mfnm - lb	none 0;2 1;3	none 4;5;6 10;11

To remove the port group with pgid 2:

switch:admin> ag --pgremove 2
Port Group 2 has been removed successfully

To enable managed fabric name monitoring in port group 3:

switch:admin> ag --pgsetmodes 3 "mfnm"
Managed Fabric Name Monitoring mode has been \
enabled for Port Group 3

switch:admin> ag --pgshow

PG_ID	PG_Name	PG_Mode	N_Ports	F_Ports
0	pg0	lb,mfnm	0;2	4;5;6
3	FirstFabric	lb,mfnm	1;3	10;11

To disable managed fabric name monitoring in port group 3:

switch:admin> ag --pgdelmodes 3 "mfnm"
Managed Fabric Name Monitoring mode has been disabled for Port Group 3

switch:admin> ag --pgshow

0 pg0 lb,mfnm 0;2 4;5;6
3 FirstFabric lb 1;3 10;11

To get the current fabric name monitoring timeout value:

```
switch:admin> ag --pgfnmtov
Fabric Name Monitoring TOV: 120 seconds
```

To set the fabric name monitoring timeout value to 30 seconds:

```
switch:admin> ag --pgfnmtov 30
```

AG Preferred port information commands

To display preferred port settings for F_Ports:

switch:admin> ag	prefshow
F_Ports	Preferred N_Port
10;11	0
12;13	1
4;6	2
7;8;9	3

To delete secondary port mapping for F_Ports 7, 8 and 9:

```
switch:admin> ag --prefdel "7;8;9" 3
Preferred N_Port is deleted successfully \
for the F_Port[s]
```

To set secondary port mapping for F_Ports 7, 8 and 9:

```
switch:admin> ag --prefset "7;8;9" 3
Preferred N_Port is set successfully \
for the F_Port[s
```

ADS Policy commands

To set the list of allowed devices for Ports 11 and 12 to 'no access':

To set the list of allowed devices for Ports 1, 10 and 13 to 'all access':

To remove two devices from the lists of allowed devices for ports 1 and 9:

To add a two new device to the lists of allowed devices for ports 1 and 9:

To display the lists of allowed devices on the switch:

```
switch:admin> ag --adsshow
F_Port
                  WWNs Allowed
                   ALL ACCESS
3
                   20:03:08:00:88:35:a0:12
                   21:00:00:e0:8b:88:01:8b
                   20:03:08:00:88:35:a0:12
                   21:00:00:e0:8b:88:01:8b
10
                   ALL ACCESS
11
                   NO ACCESS
12
                   NO ACCESS
13
                   ALL ACCESS
```

Persistent ALPA configuration commands

To enable persistent ALPA in flexible mode:

```
switch:admin> ag --persistentalpaenable 1 -f
Persistent ALPA mode is enabled
```

To enable persistent ALPA in stringent mode:

```
switch:admin> ag --persistentalpaenable 1 -s
Persistent ALPA mode is enabled
```

To disable persistent ALPA mode:

```
switch:admin> ag --persistentalpaenable 0
Persistent ALPA mode is enabled
```

To display the ALPA database entries for F_Port 5:

To attempt to remove a device entry from the database while the device is online and cannot be removed:

```
switch:admin> ag --deletepwwnfromdb \
    0:12:00:05:1e:85:92:88 20:08:00:05:1e:01:0b:4a Online. Cannot delete \
    an online device
```

To remove a device entry from the database when the device is offline:

```
switch:admin> ag --deletepwwnfromdb \
    0:12:00:05:1e:85:92:88
Device 20:13:00:05:1e:85:92:88 successfully deleted
```

To remove a device entry from the database when the device is not present in the table

```
switch:admin> ag --deletepwwnfromdb \
0:12:00:05:1e:85:92:00
20:12:00:05:1e:85:92:00 not found. Please check \
the device name
```

To remove the PWWN to ALPA value for port 5 from the database and to verify the removal:

Device WWN mapping commands

To create a WWN to N_Port mapping for two devices.

```
switch:admin> ag --addwwnmapping 8
    "0:12:00:05:1e:85:92:88; 0:12:00:05:1e:85:92:88"
```

To delete one of the device WWN to N_Port mappings.

```
switch:admin> ag --delwwnmapping 8 \
"0:12:00:05:1e:85:92:88"
```

To create a WWN to port group mapping for all currently mapped devices (this command does not affect devices not already mapped or connecting later).

```
switch:admin> ag --addwwnpgmapping 4 --all
```

To add port 13 as a preferred failover N_Port for a device:

```
switch:admin> ag --addwwnfailovermapping 13 "0:12:00:05:1e:85:92:88"
```

To disable all WWN mappings:

```
switch:admin> ag --wwnmappingdisable --all
```

To display the WWN mappings when WWN load balancing policy is not enabled:

```
        switch:admin> ag --wwnmapshow

        Static Device Mapping Information:

        WWN, lst N_Port 2nd N_Port PG_ID Current Enabled

        25:f7:00:0c:29:00:02:8b 9 None None None yes

        25:f7:00:0c:29:00:03:8b 9 None None None yes

agAutoMapBalance

Controls automatic remapping of F_Ports in AG mode.

SYNOPSIS

```
agautomapbalance --enable [-fport | -nport]
```

[-pg Port_Group_Number | -all]

agautomapbalance --disable [-fport | -nport]

[-pg Port_Group_Number | -all]

agautomapbalance --force

agautomapbalance --show

agautomapbalance --help

DESCRIPTION

Use this command to control the automatic rebalancing of F_Ports for login distribution in the event that an F_Port goes offline or an N_Port comes online.

If automatic rebalancing is enabled, and an F_Port goes offline, the remaining F_Port logins are redistributed across the existing N_Ports. Similarly if a new N_Port comes online, some of the F_Port logins being routed through existing N_Ports would be failed over to the new N_Ports. Both operations are potentially disruptive. Disabling automatic rebalancing of login distribution provides a way of avoiding disruptions associated with routine F_Port/N_Port offline/online events.

The default values for **agautomapbalance** are as follows:

- Disable automatic login redistribution when F_Ports go offline.
- Enable automatic login redistribution when N_Ports come online.

Use the **--show** option to display the current configuration of the automatic rebalancing feature. The command output varies depending on current AG policy settings:

- If Port Group Policy is enabled on the switch, the command displays the following information for each configured port group:
 - PG_ID Port Group number
 - LB mode Login Balancing mode: enabled or disabled
 - nport Enabled or disabled
 - fport- Enabled or disabled
- If Auto Policy is enabled on the switch, the command displays the status of the automatic rebalancing feature per port type as either disabled or enabled.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--enable

Enables automatic login redistribution upon removal or addition of a specified port type.

-fport

Enables automatic login redistribution in the event that one or more F_Ports go offline. When automatic login redistribution is enabled, the remaining F_Ports are remapped such that logins are balanced among the existing Imports.

-nport

Enables automatic login redistribution in the event that one or more N_Ports come online. When automatic login redistribution is enabled, the F_Ports mapped to the current N_Ports are rebalanced among the N_Ports.

--disable

Disables automatic login redistribution upon removal or addition of a specified port type.

-fport

Disables automatic login redistribution in the event that one or more F_Ports go offline. When automatic login redistribution is disabled, the remaining F_Ports maintain their existing N_Port mappings.

-nport

Disables automatic login redistribution in the event that one or more N_Ports come online. When auto map balancing is enabled, the F_Ports mapped to the current N_Ports are rebalanced among the N_Ports.

-pg Port_Group_Number | -all

Specifies the port group number or all port groups. These operands are mutually exclusive and optional with the **--enable** and **--disable** options. When a port group is specified, command execution is targeted to the members of that specific port group. When all port groups are specified, command execution is targeted to all port groups defined in the Access Gateway. The port group options are allowed only when login balancing is enabled on the specified port groups.

--force

Enforces automatic login redistribution on a one-time basis in the event that automatic login redistribution is disabled for N_Port addition, F_Port removal or both. This command forces rebalancing of the F_Port to N_Port mapping once. It does not affect the configuration settings.

--show

Displays the auto login distribution configuration.

--help

Displays the command usage.

EXAMPLES

To display the automatic login redistribution settings for port groups 0 and 1:

switch:admin> agautomapbalanceshow				
AG Policy:	pg			
PG_ID	LB mode	nport	fport	
0 1	Enabled Disabled	Enabled	Disabled -	

To display the automatic login redistribution settings for N_Ports and F_Ports.

```
switch:admin> agautomapbalance --show

AG Policy: Auto
automapbalance on N_Port Online Event: Disabled automapbalance on F_Port Offline Event: Enabled
```

To disable automatic login redistribution on F_Port offline events:

```
switch:admin> agautomapbalance --disable -fport
```

To enable automatic login redistribution on F_Ports and N_Ports on port group 1 in the Access Gateway:

```
switch:admin> agautomapbalance --enable -fport pg 1
```

To disable automatic login redistribution on F_Ports and N_Ports on all port groups in the Access Gateway:

```
switch:admin> agautomapbalance --disable -all
```

SEE ALSO ag, agShow

agShow

Displays the Access Gateway information registered with the fabric.

SYNOPSIS

agshow --name ag_name

agshow --local

agshow

DESCRIPTION

This command displays the details of the F_Ports and the configured N_Ports in the Access Gateway attached to the fabric. The command output displays the following information.

Name

The name of the Access Gateway.

NodeName

The World Wide Name of the Access Gateway node.

Ports

The number of ports in the Access Gateway.

Enet IP Addr

The IP address of the Access Gateway.

Firmware

Current firmware running on the Access Gateway.

Local/Remote

Indicates whether the Access Gateway is locally or remotely registered to this

switch.

World Wide Name

The world wide name (WWN) of the given Access Gateway.

N-Port ID(s)

The port ids of the N_Ports configured in the given Access Gateway.

N-Ports

The number of configured N_Ports that are online.

F-Ports

The number of F_Ports that are online.

Attached F-Port information

Displays the Port ID and the Port WWN of each F_Port that is online on the Access Gateway.

Access Gateway F-Port information

Displays the port number, the port ID, and the Port WWN of the Access Gateway to which the F_Port is connected. This information is displayed only if both the Access Gateway and the switch to which the Access Gateway is attached are running Fabric OS v.7.0.0. The data in this section is not always synchronized with the data in the Attached F-Port information section.

NOTES

NPIV capability should be enabled on the ports connected to the Access Gateway. NPIV capability is enabled by default. Use portCfgNPIVPort to enable NPIV capability a port if it was previously disabled. Note that enabling or disabling NPIV capability is no longer supported in Access Gateway mode.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following optional operands:

--name ag_name

Displays information regarding a specific Access Gateway that is registered with this fabric.

--local

Display information regarding all Access Gateways that are locally registered to this switch.

EXAMPLES

To display the Access Gateway information registered with the fabric:

```
switch:admin> agshow --name E2_C_AG5100_134236
        : E2_C_AG5100_134236

portCfgNPIVPort SEE ALSO

aliAdd

Adds a member to a zone alias.

SYNOPSIS

aliadd "aliName", "member[; member...]"

DESCRIPTION

Use this command to add one or more members to an existing zone alias. The alias member list cannot contain another zone alias.

This command changes the defined configuration. For the change to become effective, enable the zone configuration with the **cfgEnable** command. For the change to be preserved across switch reboots, save the zone configuration to nonvolatile memory with the **cfgSave** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

The following operands are required:

"aliName"

Specify the name of a zone alias, enclosed in double quotation marks.

"member"

Specify a member or list of members to be added to the alias, enclosed in double quotation marks. Members must be separated by semicolons. An alias member can be specified by one or more of the following methods:

- A switch domain and port index pair. Use switchShow for a list of valid port index numbers.
- A world wide name (WWN).

EXAMPLES

To add members to zone aliases array1, array2, and loop1:

```
switch:admin> aliadd "array1", "1,2"
switch:admin> aliadd "array2", "21:00:00:20:37:0c:72:51"
```

SEE ALSO

aliCreate, aliDelete, aliRemove, aliShow

aliCreate

Creates a zone alias.

SYNOPSIS

alicreate "aliName", "member[; member...]"

DESCRIPTION

Use this command to create a new zone alias. The zone alias member list must have at least one member (empty lists are not allowed). The alias member list cannot contain another zone alias. Refer to the **zoneCreate** command for more information on name and member specifications.

This command changes the defined configuration. For the change to become effective, enable the zone configuration with the cfgEnable command. For the change to be preserved across switch reboots, save the zone configuration to nonvolatile memory with the cfgSave command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

The following operands are required:

"aliName"

Specify a name for the zone alias, in double quotation marks. A zone alias name must begin with a letter and can be followed by any number of letters, numbers, and underscore characters. Names are case-sensitive. For example, "Ali_1" and "ali_1" are different zone aliases. Spaces are ignored.

"member"

Specify a member or list of members to be added to the alias, enclosed in double quotation marks. Members must be separated by semicolons. An alias member can be specified by one or more of the following methods:

- A switch domain and port index pair. Use switchShow for a list of valid port index numbers.
- A world wide name (WWN).

EXAMPLES

To create a zone alias defined by domain and port index pairs:

```
switch:admin> alicreate "array1", "2,32; 2,33; 2,34"
```

To create a zone alias with one member defined by WWN.

```
switch:admin> alicreate "array2", "21:00:00:20:37:0c:66:23"
```

SEE ALSO

aliAdd, aliDelete, aliRemove, aliShow

aliDelete

Deletes a zone alias.

SYNOPSIS alidelete "aliName"

DESCRIPTION Use this command to delete a zone alias.

This command changes the defined configuration. For the change to become effective, enable the zone configuration with the **cfgEnable** command. For the change to be preserved across switch reboots, save

the zone configuration to nonvolatile memory with the **cfgSave** command.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS The following operand is required:

"aliName"

Specify the name of the zone alias to be deleted. This operand must be enclosed

in quotation marks.

EXAMPLES To delete the zone alias "array2":

switch:admin> alidelete "array2"

SEE ALSO aliAdd, aliCreate, aliRemove, aliShow

aliRemove

Removes a member from a zone alias.

SYNOPSIS

aliremove "aliName", "member[; member...]"

DESCRIPTION

Use this command to remove one or more members from an existing zone alias.

If all members are removed, the zone alias is deleted.

This command changes the defined configuration. For the change to become effective, enable the zone configuration with the **cfgEnable** command. For the change to be preserved across switch reboots, save the zone configuration to nonvolatile memory with the **cfgSave** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

This command has the following operands:

"aliName"

Specify the name of the zone alias from which members are to be removed in double quotation marks. This operand is required.

"member"

Specify a member or list of members to be removed from the alias. The list must be enclosed in double quotation marks. Members must be separated by semicolons. An alias member can be specified by one or more of the following methods:

- A switch domain and port index number pair. Use switchShow for a list of valid port index numbers.
- A world wide name (WWN)

The member list is located by an exact string match; therefore, it is important to maintain the order when removing multiple members. For example, if a zone alias contains"1,2; 1,3; 1,4", then removing"1,3; 1,4" succeeds but removing"1,4; 1,3" fails.

EXAMPLES

To remove a world wide name from "array1":

```
switch:admin> aliremove "array1", "3,5"
switch:admin> aliremove "array1", "21:00:00:20:37:0c:76:8c"
switch:admin> aliremove "array1", "0xEF"
```

SEE ALSO

aliAdd, aliCreate, aliDelete, aliShow

aliShow

Displays zone alias information.

SYNOPSIS

alishow ["pattern"][, mode]

DESCRIPTION

Use this command to display zone configuration information.

Use the pattern operand to display only matching zone alias names in the defined configuration.

If no parameters are specified, all zone configuration information (both defined and effective) is displayed. Refer to **cfgShow** for a description of this display.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

When invoked without an operand, this command displays all zone configuration information (defined and effective). Refer to **cfgShow** for a description of this display. The following operands are optional:

"pattern"

A POSIX-style regular expression that matches zone alias names. This operand must be enclosed in quotation marks. Patterns may contain:

- Question mark (?) matches any single character.
- Asterisk (*) matches any string of characters.
- Range matches any character within the range. Ranges must be enclosed in brackets: for example, [0-9] or [a-f].

mode

Specify 0 to display the contents of the transaction buffer (the contents of the current transaction), or specify 1 to display the contents of the nonvolatile memory. The default value is 0.

EXAMPLES

To display all zone aliases beginning with "arr":

```
switch:admin> alishow "arr*"
alias: array1     21:00:00:20:37:0c:76:8c
alias: array2     21:00:00:20:37:0c:66:23
```

appLoginHistory

Displays the history of HTTP login sessions.

SYNOPSIS apploginhistory -- show

apploginhistory --help

DESCRIPTION

Use this command to display the history of HTTP login sessions from external management applications such as Brocade Network Advisor or Web Tools. The command displays both current sessions and a history of past sessions. For each entry, the command output shows the following information:

- The date and time when the session started (YYYY/MM/DD-HH:MM:SS.MS).
- The IP address of the machine that initiated the HTTP login.
- The role of the user initiating the login.
- The application initiating the login.

The history supports a maximum of 100 entries. If the history exceeds the maximum size, the oldest entries will be removed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--show

Displays the currently active logins and a history of past logins.

--help

Displays the command usage.

EXAMPLES

To display the application login history:

```
switch:admin> apploginhistory -- show
```

```
applications
(Login Timestamp, IP Address, User Account, Application):

```

SEE ALSO None

aptPolicy

Changes or displays the Advanced Performance Tuning (APT) policy.

SYNOPSIS

aptpolicy [policy]

aptpolicy -ap [ap_policy]

DESCRIPTION

Use this command to display and change the advanced performance tuning (APT) policies on a switch. Several internal performance tuning parameters can be modified with this command. The default parameters (AP shared Link Policy) are optimized for most SAN applications; in most environments, there is no need to modify the default policy.

Distributed path selection (DPS) is supported in logical fabrics. APT policy settings affecting the DPS behavior can be configured per logical switch, and settings apply to the partition for which they are set. Note that policy settings for the base switch or any switch in the base fabric affect all traffic going through the base fabric including any logical fabric traffic that uses the base fabric.

In a logical fabric environment, Link Policy settings (aptpolicy -ap) apply only to the base switch and can be executed only on the base switch.

When invoked without arguments, this command displays the APT policies supported on this switch, as well as the current policy.

NOTES

You must disable the switch before using this command to change the current policy. Changes take effect immediately for all EX/VEX Ports after the switch is re-enabled.

For details on performance tuning, refer to the Fabric OS Administrator's Guide.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

policy

Specifies the APT policy. The following polices are supported:

1

Port-based routing policy. With this policy, the path chosen for an ingress frame is based on both of the following items:

- The ingress port on which the frame was received.
- The destination domain for the frame.

The chosen path remains the same if Dynamic Load Sharing (DLS) is not enabled. If DLS is enabled, a different path may be chosen for a fabric event. Refer to **dlsSet** for a definition of a fabric event.

This policy may provide better ISL utilization when there is little or no oversubscription of the ISLs.

Note that static routes are supported only with this policy.

3

Exchange-based routing policy (default). With this policy, the path chosen for an ingress frame is based on all of the following items:

- The ingress port on which the frame was received.
- The FC address of the source fabric device (SID) for this frame.

- The FC address of the destination fabric device (DID) for this frame.
- The FC Originator Exchange ID (OXID) for this frame.

This policy optimizes the utilization of the available paths by allowing I/O traffic between different SID, DID, or OXID pairs to use different paths. All frames received on an ingress port with the same SID, DID, or OXID parameters take the same path unless there is a fabric event. Refer to **dlsSet** for the definition of a fabric event.

This policy does not support static routes. DLS is always enabled and the DLS setting cannot change with this policy.

-ap ap_policy

Specifies an additional AP policy option supported under both port-based and exchange-based policies. If logical fabrics are enabled, this command is valid only on the base switch. The following policies are supported:

0

AP Shared Link Policy (default).

1

AP Dedicated Link Policy. This policy dedicates some links to the ingress traffic and some links to the egress traffic. This policy relieves internal congestion in an environment where there is a large amount of traffic going through both directions at the same time. In addition, it can reduce the impact of slow devices on the overall switch performance.

EXAMPLES To display the current APT policy:

To change the current APT policy to the AP Shared Link Policy:

```
switch:admin> aptpolicy -ap 0
Switch must be disabled in order to modify \
this configuration
parameter. To disable the switch, use the \
"switchDisable" command.
switch:admin> switchdisable
switch:admin> aptpolicy -ap 0
Policy updated successfully.
switch:admin> switchenable
switch:admin> aptpolicy
Current Policy: 3 0(ap)
3 O(ap): Default Policy
1: Port Based Routing Policy
3: Exchange Based Routing Policy
   0: AP Shared Link Policy
    1: AP Dedicated Link Policy
```

auditCfg

Modifies and displays the audit log filter configuration.

SYNOPSIS

auditcfg --class audit class

auditcfg --enable | --disable

auditcfg --severity severity_level

auditcfg --show

DESCRIPTION

Use this command to configure the audit logging and to display the audit log configuration. This command allows you to set filters by configuring certain classes, to add or remove any of the classes in the filter list, to set severity levels for audit messages, and to enable or disable audit filters. Based on the configuration, certain classes are logged to syslog for auditing. Syslog configuration is required for logging audit messages. Use the syslogdlpAdd command to add the syslogd server IP address.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--class

Configures filters for a specified audit class. To add or remove any of the classes

in the filter list, reissue the --class option.

audit_class

Specifies the filters to be configured. Valid values are: 1-ZONE, 2-SECURITY, 3-CONFIGURATION, 4-FIRMWARE, 5-FABRIC, 6-FW (Fabric Watch), and 7-LS

(Logical Switch). This operand is required.

--severity

Sets audit severity level. When severity is set, only log messages of type

severity_level and higher are displayed.

severity_level

Valid values are INFO, WARNING, ERROR, and CRITICAL. By default, all

messages are logged. This operand is required.

--enable

Enables all filters.

--disable

Disables all filters.

--show

Displays the current configuration. This operand is optional.

EXAMPLES

To configure the audit log filter:

```
switch:admin> auditcfg --class 2,3
Audit filter is configured.
```

To enable audit logging:

```
switch:admin> auditcfg --enable
Audit filter is enabled.
```

To display the configuration:

```
switch:admin> auditcfg --show
Audit filter is enabled.
1-ZONE
2-SECURITY
3-CONFIGURATION

4-FIRMWARE
5-FABRIC
6-FW
7-LS
Severity level: INFO
```

To disable audit logging:

```
switch:admin> auditcfg --disable
Audit filter is disabled.
```

SEE ALSO auditDump

auditDump

Displays or clears the audit log.

SYNOPSIS auditdump -s | -show

auditdump -c | -clear

DESCRIPTION

Use this command to display or clear the audit log on the switch. The audit log persistently saves the most recent 256 log entries on the switch. On modular platforms, the entries are not shared across CPs. To display or clear the logs, this command must be issued for each CP separately.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-s | -show

Displays the audit log on the switch or the CP.

-c | -clear

Clears the audit log on the switch or the CP.

EXAMPLES To display the audit log:

```
switch:admin> auditdump -s
0 AUDIT, 2010/02/18-01:45:52 (PDT), [SEC-3022], INFO, SECURITY,
admin/admin/10.32.220.161/http/DCFM-HttpConnec, ad_0/ras035/FID
128,, Event: logout, Status: success, Info: Successful logout
by user [admin].
```

1 AUDIT, 2010/02/18-01:46:00 (PDT), [SEC-3022], INFO, SECURITY, admin/admin/10.32.220.161/http/DCFM-HttpConnec, ad_0/ras035/FID 128,, Event: logout, Status: success, Info: Successful logout by user [admin].

2 AUDIT, 2010/02/18-01:46:18 (PDT), [SEC-3020], INFO, SECURITY, admin/admin/10.32.220.161/http/DCFM-HttpConnec, ad_0/ras035/FID 128,, Event: login, Status: success, Info: Successful login attempt via HTTP, IP Addr: 10.32.220.161. (output truncated)

To clear the audit log:

switch:admin> auditdump -c

SEE ALSO auditCfg

authUtil

Displays and sets the authentication configuration.

SYNOPSIS

authutil

authutil --show

authutil --set option value

authutil --policy -sw option | -dev option

authutil --authinit [s/ot/]port[, [s/ot/]port...] | allE

DESCRIPTION

Use this command to display and set local switch authentication parameters.

Use **--set** to change authentication parameters such as protocol, Diffie-Hellman group (DH group), or hash type. When no protocol is set, the default setting of "FCAP, DH- CHAP" is used. When no group is set, the default setting of "*" (meaning "0,1,2,3,4") is used. Configuration settings are saved persistently across reboots. Configuration changes take effect during the next authentication request.

Use the **--show** command to display the current authentication configuration. Use the **portShow** command to display the authentication type and associated parameters, if applicable, used on the port.

Authentication parameters are set on a per-switch basis. If Virtual Fabrics are enabled, all authentication parameters apply to the current logical switch context only, and must be configured separately for each logical switch. Use **setContext** to change the current logical switch context.

In a VF environment, authentication is performed only on physical E_Ports, not on logical interswitch links (LISLs).

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details

OPERANDS

This command has the following operands:

--show

Displays the local authentication configuration.

--set option value

Modifies the authentication configuration. Valid *options* and their *values* include the following:

-a fcap | dhchap | all

Sets the authentication protocol. Specify "fcap" to set only FCAP authentication. Specify "dhchap" to set only DH-CHAP authentication. Specify "all" to set both FCAP and DH-CHAP, which is the default setting. When authentication is set to "all", the implicit order is FCAP followed by DH-CHAP. This means that in authentication negotiation, FCAP is given priority over DH-CHAP on the local switch. If the negotiation is done for an encrypted port, DHCHAP takes precedence over FCAP.

-g 0 | 1 | 2 | 3 | 4 | *

Sets the Diffie-Hellman (DH) group. Valid values are 0 to 4 and "*". The DH group 0 is called NULL DH. Each DH group implicitly specifies a key size and associated parameters. A higher group value provides stronger cryptography and a higher level of security. When DH group is set to a specified value, only that DH group is

enabled. Specifying "*" enables all DH groups 0, 1, 2, 3, and 4, in that order. This means that in authentication negotiation, the NULL DH group is given priority over all other groups. In the case of a port that is enabled for encryption and you specify "*", the DH group 4 is selected.

-h sha1 | md5 | all

Sets the hash type. Valid values are "sha1", "md5" or "all", which sets both hash types. Use this option to disable md5 authentication access by setting the hash type to sha1 only. Disabling md5 access is required when configuring the system for FIPS. Refer to the *Fabric OS Administrator's Guide* for details on FIPS configuration.

--policy

Sets the switch authentication policy or device authentication policy. The following options are supported:

-sw on |off | active | passive

Sets the switch authentication policy. Specify one of the following modes. Operands are exclusive. If the switch has ports enabled for encryption, only the ON and ACTIVE options are supported.

on

Sets the switch authentication policy to ON mode. Strict authentication is enforced on all E_Ports. The interswitch link (ISL) goes down (port disable), if the connecting switch does not support the authentication or the authentication policy is switched off.

off

Turns the authentication policy off, and the switch rejects any authentication requests.

active

Sets the authentication policy to active mode. During switch initialization, authentication is initiated on all E_Ports, but the port is not disabled if the connecting switch does not support authentication or the authentication policy is turned off.

passive

Sets the authentication policy to passive mode (default) . The switch does not initiate authentication but participates in authentication if the connecting switch initiates authentication.

-dev off | passive | on

Sets the device authentication policy. Three modes are supported. Device authentication policy is off by default.

off

Turns off the device authentication policy. Authentication is not required. The switch ignores any authentication requests and continues with the FC probing without authentication.

passive

Sets the authentication policy to passive mode. Authentication is optional. If the attached device is capable of doing the authentication then the switch participates in authentication; otherwise it forms an F_Port without authentication. In this mode the device accepts authentication on all F_Ports.

on

Sets the authentication policy to "on" mode. Authentication is mandatory. If the attached device is not capable of doing authentication, the corresponding port is disabled.

--authinit [slot/]port [, [slot/]port...| allE

Reinitiates authentication on selected ports after changing the DH-CHAP group, hash type, and shared secret between a pair of switches. This command does not work on Private, Loop, NPIV and FICON devices. The command can reinitiate authentication only if the device was previously authenticated. This command may bring down the E_Ports if the DH-CHAP shared secrets are not installed correctly. This command is not supported on encrypted ports ports. Valid options include the following:

slot

Specify the slot number, if applicable, followed by a slash (/).

port

Specify the port number. On enterprise-class platforms, use the *slot/port* format for specifying the port number.

allE

Specify all E_Ports in the switch.

EXAMPLES

To display authentication configuration on the switch:

```
switch:admin> authutil --show
AUTH TYPE HASH TYPE GROUP TYPE
------
fcap,dhchap shal,md5 0,1,2,3,4

Switch Authentication Policy: PASSIVE
Device Authentication Policy: OFF
```

To set DH-CHAP as the authentication protocol:

```
switch:admin> authutil --set -a dhchap
Authentication is set to dhchap.
```

To set both protocols in order of FCAP and then DH-CHAP:

```
switch:admin> authutil --set -a all
Authentication is set to fcap,dhchap.
```

To set DH group 3:

```
switch:admin> authutil --set -g 3
DH Group was set to 3.
```

To set all DH groups to be specified in the authentication negotiation in the order of 0, 1, 2, 3, and 4:

```
switch:admin> authutil --set -g "*"
DH Group is set to 0,1,2,3,4
```

To set the Switch policy to active mode:

```
switch:admin> authutil --policy -sw active
Warning: Activating the authentication policy requires
either DH-CHAP secrets or PKI certificates depending
on the protocol selected. Otherwise, ISLs will be
segmented during next E-port bring-up.
ARE YOU SURE (yes, y, no, n): [no] y
Auth Policy is set to ACTIVE
```

To set the Device policy to passive mode:

```
switch:admin> authutil --policy -dev passive
Warning: Activating the authentication policy requires
DH-CHAP secrets on both switch and device. Otherwise,
the F-port will be disabled during next F-port
ARE YOU SURE (yes, y, no, n): [no] y
Device authentication is set to PASSIVE
```

To set the device authentication policy to "on" mode:

```
switch:admin> authutil --policy -dev on
Warning: Activating the authentication policy requires
DH-CHAP secrets on both switch and device. Otherwise,
the F-port will be disabled during next F-port
bring-up.
ARE YOU SURE (yes, y, no, n): [no] y
Device authentication is set to ON
2008/03/24-23:13:06, [AUTH-1003], 112,, INFO, Stealth_3,
Device authentication type has been successfully set to ON
```

To start authentication on E/F_Ports 2, 3, and 4:

```
switch:admin> authutil --authinit 2,3,4
Warning: Initiating the authentication requires either DH-CHAP
secrets or PKI certificates depending on the protocol selected.
Failed authentication may result in traffic disruption.
Authentication will not be initiated on encrypted ports.
ARE YOU SURE (yes, y, no, n): [no]y
```

To disable md5 hash type for FIPS configuration:

```
switch:admin> authutil --show
AUTH TYPE HASH TYPE GROUP TYPE
_____
fcap,dhchap sha1,md5 1
Switch Authentication Policy: PASSIVE
Device Authentication Policy: OFF
switch:admin> authutil --set -h sha1
Hash is set to shal.
switch:admin> authutil --show
AUTH TYPE HASH TYPE GROUP TYPE
_____
fcap,dhchap shal
Switch Authentication Policy: PASSIVE
Device Authentication Policy: OFF
```

SEE ALSO portShow, secAuthSecret

bannerSet

Sets the banner on the local switch.

SYNOPSIS bannerset [banner]

DESCRIPTION Use this command to set the banner on the local switch.

The banner is a string of alphanumeric characters. It is displayed after you log in to a switch.

The banner can be created using the *banner* operand or interactively by entering the **bannerSet** command without an operand.

If you enter the banner text using the interactive method, the valid length is 1022 characters. If the banner text length exceeds the maximum allowed, the software truncates the input. To close the banner text string, enter a period at the beginning of a new line.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details

OPERANDS

This command has the following optional operand:

banner

Specify a text string to be displayed upon login. If you enter the banner text using the banner operand, the valid length is 116 characters.

EXAMPLES

To set a new banner for a switch:

```
switch:admin> bannerset "My banner"
switch:admin> bannerSet
Please input context of security banner (press "." RETURN \
at the beginning of a newline to finish input):
```

SEE ALSO

bannerShow, motd

bannerShow

Displays the banner text.

SYNOPSIS bannershow

DESCRIPTION Use this command to display the text of the local switch banner.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the banner for a switch:

switch:admin> bannershow

Banner: Do not disturb the setup on this switch.

SEE ALSO bannerSet, motd

bcastShow

Displays broadcast routing information.

SYNOPSIS

bcastshow

DESCRIPTION

Use this command to display the broadcast routing information for all ports in the switch. The broadcast routing information indicates all ports that are members of the broadcast distribution tree: ports that are able to send and receive broadcast frames.

Normally, all F_Ports and FL_Ports are members of the broadcast distribution tree. The broadcast path selection protocol selects the E_Port members of this tree in a manner designed to prevent broadcast routing loops.

The following fields are displayed:

Group

The multicast group ID of the broadcast group (always 256).

Member Fx Ports

A map of all F_Ports and FL_Ports ports in the broadcast tree.

Member E_Ports

A map of all E_Ports in the broadcast tree.

The broadcast routing information for the ports is displayed as a set of hexadecimal bit maps. Each bit in a bit map represents a port, with the least significant bit in each row representing port 0, 32, 64, and so on.

NOTES

The output from this command may vary depending on the hardware platform.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

None

EXAMPLES

To display the broadcast routing information for all ports in the switch:

switch:admin> bcastShow

Group	Member Ports	Member ISL Ports
256	0x00012083	0x00002080
	0×00000440	0×00000400
	0x00770000	0×00700000
	0x00008200	0×000000000
	0×00000001	0×000000000

In this example from a switch with 128 ports, the member ports consist of ports 7, 13, 42, 84, 85, and 86. The final Member Ports bit set represents the embedded port (frames sent to be handled by firmware).and is typically set.

SEE ALSO

portRouteShow

bladeCfgGeMode

Configures a GbE port or a 10GbE port on the Brocade FX8-24 blade.

SYNOPSIS bladecfggemode --set mode -slot slot

bladecfggemode --show -slot slot | -all

bladecfggemode --help

DESCRIPTION

Use this command to configure the GbE port mode on the Brocade FX8-24 extension blade or to display the configuration. The mode configuration controls which ports are enabled.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only on the Brocade FX8-24 blade in a DCX or DCX-S4 chassis.

OPERANDS

This command has the following operands:

--set mode

Sets the GbE port mode for a specified slot. Valid modes are one of the following:

1g

Enables the GbE ports ge0-ge9 (xge0 and xge1 are disabled).

10g

Enables the GbE ports xge0 and xge1 (ge0-ge9 ports are disabled).

dual

Enables the GbE ports ge0-ge9 and xge0 (xge1 is disabled).

-slot slot

Specifies the slot number for the FX8-24 blade. This operand is required when

setting the GbE port mode

--show

Displays the GbE port mode for the specified slots.

-slot slot

Displays the GbE port mode for a single slot.

-all

Displays the GbE port mode for all configured slots.

--help

Displays the command usage.

EXAMPLES

To configure the Brocade FX8-24 blade in slot 4 in 1G mode:

```
switch:admin> bladecfggemode --set 1g -slot 4
```

To display the GbE port mode for the Brocade FX8-24 blade in slot 4:

```
switch:admin> bladecfggemode --show -slot 4
bladeCfgGeMode: Blade in slot 4 is configured in 10GigE Mode
10GigE mode: only xge0 and xge1 are enabled (ge0-9 ports \
are disabled)
```

To display the GbE port mode for all configured slots:

```
switch:admin> bladecfggemode --show -all
bladeCfgGeMode: Blade in slot 1 is configured in 1GigE Mode
1GigE mode: only the ge0-9 ports are enabled (xge0 and xge1 \
are disabled)
bladeCfgGeMode: Blade in slot 4 is configured in 10GigE Mode
10GigE mode: only xge0 and xge1 are enabled (ge0-9 ports \
are disabled)
```

SEE ALSO None

bladeDisable

Disables all user ports on a blade.

SYNOPSIS

bladedisable slot

DESCRIPTION

Use this command to disable all user ports on a blade. All Fibre Channel ports on the blade are taken offline. If the switch was connected to a fabric through this blade, the remaining switches reconfigure, and the switch reconfigures based on the other blade ports. As each port is disabled, the front panel LED changes to a slow-flashing amber.

After issuing **bladeDisable** on a slot in a chassis, **switchShow** displays the user ports in the disabled state. The blade is still shown as enabled in both **switchShow** and **slotShow** output.

The blade must be disabled before making configuration changes or before running many of the diagnostic tests. The blade does not need to be disabled before rebooting or powering off.

You cannot disable a blade when the blade is faulted, powered off, or running diagnostics.

This command disables the ports on a single blade. To disable the ports in an entire chassis, use the **chassisDisable** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

slot

Specifies the slot number for the ports to be disabled.

EXAMPLES

To disable a blade in slot 5:

```
switch:admin> bladedisable 5
Blade 5 is being disabled...Done
```

To verify that the user ports on the blade are disabled:

```
switch:admin> switchshow -slot 5
switchName: DCX57_9
switchType: 62.1
switchState: Online
switchMode: Native
switchRole: Subordinate
switchDomain: 9
switchBeacon: OFF
FC Router:
          OFF
FC Router BB Fabric ID: 128

SEE ALSO bladeEnable, chassisDisable, chassisEnable, portDisable, portEnable, slotShow, switchEnable, switchDisable, switchShow

bladeEnable

Enables all user ports on a blade.

SYNOPSIS

bladeenable slot

DESCRIPTION

Use this command to enable all user ports on a blade. All ports within the blade that did not fail the power-on self-test (POST) are enabled (except for persistently disabled ports). They may come online if connected to a device, or remain offline if disconnected. Use the **bladeEnable** command to re-enable the blade after making configuration changes or running offline diagnostics.

If the switch is connected to a fabric through previously disabled ports, it rejoins the fabric. If this switch remains the principal switch at the end of the fabric countdown, it assigns itself a domain ID. If another switch assumes the principal role, the re-enabled switch becomes a subordinate switch and accepts a domain ID from the principal.

As each port is enabled, the front panel LED changes from a slow-flashing amber to nonflashing green for online ports or to nonflashing amber for ports that do not initialize. Disconnected ports remain unlit.

NOTES

You cannot disable a single blade when the entire chassis is disabled, or when the blade itself is faulted, powered off, or running diagnostics. Use **chassisEnable** to enable the ports on an entire chassis.

Persistently disabled ports are not enabled by this command.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

slot

Specifies the slot number to be enabled.

EXAMPLES

To display the slot status, enable the user ports in slot 4, and verify the settings:

switch:admin> slotshow

Slot	Blade Type	ID	Status			
1 2 3	SW BLADE UNKNOWN UNKNOWN	2	ENABLED VACANT VACANT			
4	SW BLADE	2	ENABLED	(User	Ports	Disabled)
5 6	CP BLADE CP BLADE	1 1	ENABLED ENABLED			
7	SW BLADE	2	ENABLED			
8 9	UNKNOWN		VACANT VACANT			
10	UNKNOWN		VACANT			

switch:admin> bladeenable 4
Blade 4 is being enabled...Done

switch:admin> slotshow

Slot	Blade Type	ID	Status
1	SW BLADE	2	ENABLED
2	UNKNOWN		VACANT

3	UNKNOWN		VACANT
4	SW BLADE	2	ENABLED
5	CP BLADE	1	ENABLED
6	CP BLADE	1	ENABLED
7	SW BLADE	2	ENABLED
8	UNKNOWN		VACANT
9	UNKNOWN		VACANT
1 0	IINKNOWN		VACANT

SEE ALSO bladeDisable, chassisDisable, chassisEnable, portEnable, portDisable, switchDisable, switchShow

bladeSwap

Swaps the area numbers for matching port pairs of two blades.

SYNOPSIS

bladeSwap -src source slot -dest destination slot

DESCRIPTION

Use this command to swap the area numbers for matching port pairs of two blades. All ports must qualify for swapping for this command to succeed. It validates that the blades in the indicated slots are of the same type, have the same number of ports, and that the port pairs are in the same partition.

If all the ports qualify for swapping, this command automatically performs the following operations:

- 1. It enables the port swapping feature by executing the **portSwapEnable** command.
- It takes all ports on both the source and destination blades offline by executing the bladeDisable command.
- It swaps the matching port pairs on each of the specified blades.
- It re-enables the blade by executing the bladeEnable command.

The result of this operation is persistent across reboots and power cycles.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command leaves both the source and destination blades in a disabled state. To enable all ports on a blade, issue the **bladeEnable** command. To enable individual ports, issue the **portEnable** command.

This command affects port swap information that is kept in its own database. It cannot be manipulated by editing the configuration database reported by configShow

OPERANDS

This command has the following operands:

-src source_slot

Specifies the slot number for the source blade.

-dest destination_slot

Specifies the slot number for the destination blade. Use slotShow for a listing of valid slots.

EXAMPLES

To swap area numbers between matching port pairs of two slots:

```
switch:admin> bladeswap -src 1 -dest 3
bladeswap done
```

portSwapEnable, portSwapDisable, portSwapShow, portShow, portEnable, portDisable, bladeEnable, bladeDisable, switchShow, switchEnable

bootLunCfg

Transparently configures the boot LUN for an HBA.

SYNOPSIS bootluncfg --add HBA_WWN PWWN LUN_ID

bootluncfg --delete HBA WWN [PWWN LUN ID]

bootluncfg --show

bootluncfg --help

DESCRIPTION Use this command to configure the boot LUN for an HBA.

Existing fabric-based boot LUN discovery allows the host's boot LUN information to be stored in the fabric zone database by using a zone name that contains the PWWN of an HBA port. The zone members consist of storage target PWWN and LUN ID.

This command provides a simplified and transparent procedure for configuring the boot LUN. Once configured, the HBA boot code queries the zone member list for the zone name matching the HBA PWWN to determine the boot target and LUN.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

HBA WWN

Specifies the WWN of the HBA port connecting to the boot LUN. This is a

hexadecimal number, for example, 10:00:00:00:05:1e:41:9a:cb.

PWWN

Specifies the WWN of the remote storage target's port. For example,

50:00:05:1e:41:9a:ca. This operand is required with the --add option and

optional with the --delete option.

LUN_ID

Specifies the hexadecimal LUN identification. The LUN ID is represented as an

eight-byte value (four-level LUN addressing), for example,

 ${\tt 09AABBCCDDEEFF00}.$ This operand is required with the --add option and

optional with the --delete option.

--add

Configures the specified HBA (HBA_WWN) to boot from the specified LUN

(LUN_WWN) accessible through the Target PWWN (PWWN).

--delete

Removes the mapping for the HBA (HBA_PWWN) to boot from the LUN (LUN_ID)

accessible through the Target Port (PWWN).

--show

Displays all configured HBA to Port/LUN Mappings.

--help

Displays the command usage.

EXAMPLES To configure a boot LUN:

```
switch:admin> bootluncfg --add 11:22:ab:44:44:ff:44:ca \
   1b:6c:55:55:55:3a:55:ff 9abc345fa1112410
Operation Successful
```

To display existing Port/LUN mappings:

switch:admin> bootluncfgn--show

```
00:11:22:33:44:55:66:77
00:00:00:00:aa:bb:cc:dd;00:00:01:ee:ff:11:22; \

bottleneckmon --help

DESCRIPTION

Use this command to (1) detect latency and congestion bottlenecks on F[L]_Ports and E_Ports and (2) to manage credit recovery on back-end ports. Bottleneck detection and credit recovery are two independent functions; enabling credit recovery has no impact on bottleneck detection and vice versa.

Bottleneck Detection

For bottleneck detection, this command provides the following management functions:

- Enabling or disabling bottleneck detection on a switch and optionally configuring thresholds and alert parameters.
- Changing alert parameters on specified ports after you have enabled the feature on the switch.
- Configuring severity thresholds for congestion and latency bottlenecks for a switch or for a specified port list.
- Refining the criterion for defining latency bottleneck conditions to allow for more (or less) sensitive monitoring at the sub-second level.
- Clearing the configuration on specified ports only (this option cannot be performed switch-wide).
- Excluding specified ports from being monitored or including previously excluded ports.
- Generating history or status reports that show congestion bottlenecks and latency bottlenecks.

Enabling or disabling bottleneck detection is a switch-wide operation. If Virtual Fabrics are enabled, the configuration is applied per logical switch and affects all ports on the current logical switch. After the (logical) switch-wide bottleneck detection parameters have been set, you can you can fine-tune the configuration for specific ports.

A bottleneck is defined as a condition where the offered load at a given port exceeds the throughput at the port. This command supports detection of two types of bottleneck conditions: congestion and latency.

- A congestion bottleneck arises from link over-utilization. This happens when the offered load
 exceeds throughput and throughput is at 100%. Frames attempt to egress at a faster rate than the
 line rate allows. Link utilization is measured once every second at the port. When trunked ports are
 monitored, link utilization is measured for the entire trunk. A congestion bottleneck is assumed if the
 utilization during the measured second is 95% or more.
- A latency bottleneck occurs when egress throughput at a port is lower than the offered load because of latency in the return of credits from the other end of the link. This is not a permanent condition. The offered load exceeds throughput and throughput is less than 100%. In this case, the load does not exceed the physical capacity of the channel as such, but can occur because of an underperforming device connected to the F_Port, or because of back pressure from other congestion or latency bottlenecks on the E_Ports. Bottleneck detection can help identify these devices and pinpoint the upstream bottlenecks caused by these devices inside the fabric.

When bottleneck detection is enabled on a switch and **-alert** is specified, the command triggers an SNMP and a RASlog alert when the ports on the configured switch experience latency or congestion. Another alert is sent after the condition resolves. For a given averaging time, each second is marked as affected by latency and/or congestion or not. If the number of affected seconds crosses the configured threshold, an alert is triggered for the port. You can configure a severity threshold for each type of bottleneck and the time interval over which the bottlenecks are measured.

For example, setting a latency threshold of 0.8 and a time window of 30 seconds specifies that an alert should be sent when 80% of the one-second samples over any period of 30 seconds were affected by latency bottleneck conditions. The **-qtime** option can be used to throttle alerts by specifying the minimum number of seconds between consecutive alerts. Thresholds are configured separately for each type of bottleneck and statistical data are collected independently for each condition. The **-qtime** parameter applies to both types of bottleneck detection; there can be one latency alert and one congestion alert in a configured quiet time.

Bottleneck detection works both in non-Virtual Fabric mode and in Virtual Fabric Mode. If Virtual Fabrics are enabled, bottleneck detection is configured per logical switch. If a port is removed from a logical switch after bottleneck detection is enabled on the logical switch, the configuration is retained in that logical switch. If the port is added again to the same logical switch, bottleneck detection is automatically re-enabled for this port using the retained configuration. This feature allows you to configure more than one logical switch to perform bottleneck detection on the same port, although only one logical switch performs the operation on the port at any given time.

The **--show** option displays a history of the bottleneck severity for a specified port or for all ports. Each line of output shows the percentage of one-second intervals affected by bottleneck conditions during the time window shown on that line. When issued for all ports, the union of all port statistics is displayed in addition to individual port statistics. The union value provides a good indicator for the overall bottleneck severity on the switch. You can filter the output to display only latency or congestion bottleneck statistics. When used without port operand the command displays the number of ports affected by bottleneck conditions. A "bottlenecked" port in this output is defined as any port that was affected by a bottleneck for one second or more in the corresponding interval.

When using the **--show** command, you may see a "no data for x seconds" or "no data" message displayed at the end of a line of output. The "no data..." message in any interval means that there was no data to analyze for the stated number of seconds or for the entire interval if the remark is simply "no data." This typically means that there was no traffic on the link for the stated number of seconds. The percentage of affected seconds displayed takes this into account. For example, if there was no traffic for

6 seconds in an interval of 10 seconds, and 1 second out of the other 4 seconds was affected by a bottleneck, the display for that interval would show 25% as the percentage of affected seconds (1 out of 4), and state "no data for 6 seconds." However, if there is no traffic because the port is offline, the "no data..." message is displayed.

The **--status** option displays bottleneck configuration details for the current (logical) switch. If virtual fabrics are enabled, ports not belonging to the current logical switch are not displayed. The command output includes the following information:

Bottleneck detection

Enabled or disabled

Switch-wide sub-second latency bottleneck criterion

Displays the following parameters:

Time threshold

The value set with the -lsubsectimethresh operand.

Severity threshold

The value set with the **-lsubsecsevthresh** operand.

Switch-wide alerting parameters

Displays the following parameters:

Alerts?

Yes (enabled) or No (disabled).

Congestion threshold for alert

The severity threshold for triggering a congestion alert. This threshold indicates the percentage of one-second intervals affected by congestion conditions within a specified time window. The congestion threshold is expressed as a fraction between 0 and 1.

Latency threshold for alert

The severity threshold for triggering a latency alert. This threshold indicates the percentage of one-second intervals affected by latency conditions within a specified time window. The latency threshold is expressed as a fraction between 0 and 1.

Averaging time for alert

The time window in seconds over which the percentage of seconds affected by bottleneck conditions is computed and compared with the threshold.

Quiet time for alert

The minimum number of seconds between consecutive alerts. The value assigned to this parameter applies to both latency and congestion detection.

Per-port overrides for sub-second latency bottleneck criterion

Custom configuration for the above mentioned sub-second latency bottleneck parameters. Note that everything above this line applies to all ports in the switch that don't have any custom configuration or exclusions.

Per-port overrides for alert parameters

Custom configuration for the above mentioned alert parameters.

Excluded ports

List of ports excluded from bottleneck detection.

Credit recovery on back-end ports

Use the **--cfgcredittools** commands to enable or disable credit recovery of external back-end ports and to display the configuration. When this feature is enabled, credit is recovered on external back-end ports (ports connected to the core blade or core blade back-end ports) when credit loss has been detected on these ports. When used with the **-recover onLrOnly** option, the recovery mechanism takes the following escalating actions:

- When it detects credit loss, it performs a link reset and logs a RASlog message (RAS Cx-1014).
- If the link reset fails to recover the port, the port reinitializes. A RASlog message is generated (RAS Cx-1015). Note that the port reinitialization does not fault the blade.
- If the port fails to reinitialize, the port is faulted. A RASlog message (RAS Cx-1016) is generated.
- If a port is faulted and there are no more online back-end ports in the trunk, the core blade is faulted. (Note that the port blade will always be faulted). A RASlog message is generated (RAS Cx-1017).

When used with the **-recover onLrThresh** option, recovery is attempted through repeated link resets and a count of the link resets is kept. If the threshold of more than two link resets per hour is reached, the blade is faulted (RAS Cx-1018). Note that regardless of whether the link reset occurs on the port blade or on the core blade, the port blade is always faulted.

For more information on the RASlog messages, refer to the Fabric OS Message Reference.

NOTES

Command syntax predating Fabric OS v.6.4.0 is no longer supported as of Fabric OS v.7.0.0.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The bottleneck detection commands are supported on F_Ports, FL_Ports, E_Ports, and EX_Ports.

The credit recovery commands are supported only on back-end ports of Condor, Condor 2, and Condor 3-based blades in the Brocade DCX, DCX-4S, DCX 8510-8, and DCX 8510-4 chassis.

OPERANDS

Bottleneck detection commands

The following operands support bottleneck detection:

slot

On bladed systems only, specifies the slot number of the ports to be configured, followed by a slash (/).

port_list

Specifies one or more ports, relative to the slot on bladed systems. Use **switchShow** for a listing of valid ports. The **--show** option allows only a single port or all ports ('*') to be specified with this command, unless it is used without port operand. A port list should be enclosed in double quotation marks and can consist of the following:

- A single port, for example, "8" or "5/8" on blades systems.
- A port range where beginning and end port are separated by a dash, for example, "8-13" or "5/8-13" on blades systems. A port range cannot span multiple slots.
- A set of ports, separated by a space, for example "3 5 7 8" or 5/3 5 7 8 on bladed systems.
- A wildcard ('*') indicates all ports. The wildcard must be enclosed in single quotation marks and is not allowed with the --config option. To make switch-wide changes, use --config without a port specifier.

--enable

Enables bottleneck detection on the switch. This operation is switch-wide and affects all F[L]_Ports and F_Ports. This operation enables bottleneck detection on all eligible ports of a switch, no matter when they become eligible. If you have Virtual Fabrics enabled and you move ports into a bottleneck enabled logical switch from another logical switch, bottleneck detection is enabled upon completion of the move. You can configure optional thresholds and alerts when you enable the feature, or you can change selected parameters later with the **--config** command.

--config

Modifies bottleneck detection parameters on specified ports or, when a port list is not specified, on the entire switch. Bottleneck detection must first be enabled before you can fine-tune the configuration with the **--config** command. The history of bottleneck statistics thus far will not be lost for the specified ports and can be viewed with the **--show** option. However, alert calculations restart on the specified ports when parameters change. This operation is allowed on excluded ports.

The following parameters can be optionally set with the **--enable** and **--config** commands; if omitted, default thresholds apply.

-alert

Enables alerts when configured thresholds are exceeded on the ports that are enabled for bottleneck detection. The alerting mechanism is by RASlog and SNMP traps. This operand is optional; if omitted, no alert is assumed. When **-alert** is specified, one or more of the following operands may be specified. If **-alert** is not specified and you try to specify additional configuration parameters, the command fails with an appropriate message.

-cthresh congestion_threshold

Specifies the severity threshold for congestion that triggers an alert. The threshold indicates the percentage of one-second intervals affected by the bottleneck condition within the specified time window. The threshold is expressed as the equivalent fraction between 0 and 1. The default value is 0.8.

-Ithresh latency_threshold

Specifies the severity threshold for latency that triggers an alert. The threshold indicates the percentage of one-second intervals affected by the bottleneck condition within the specified time window. The threshold is expressed as the equivalent fraction between 0 and 1. The default value is 0.1.

-time window

Specifies the time window in seconds over which the percentage of seconds affected by bottleneck conditions is computed and compared with the threshold. The maximum window size is 10800 seconds (3 hours). The default is 300 seconds.

-qtime quiet_time

Specifies the minimum number of seconds between consecutive alerts. The default is 300 seconds. The maximum is 31556926 seconds (approximately one year).

-noalert

Disables alerts. This is the default state assumed if neither **-alert** nor **-noalert** is specified.

-lsubsectimethresh time_threshold

Sets the threshold for latency bottlenecks at the sub-second level. The *time_threshold* specifies the minimum fraction of a second that must be affected by latency in order for that second to be considered affected by a latency bottleneck. For example, a value of 0.75 means that at least 75% of a second must have had latency bottleneck conditions in order for that second to be counted as an affected second. The time threshold value must be greater than 0 and no greater than 1. The default value is 0.8. Note that the application of the sub-second numerical limits is approximate. This command erases the statistics history and restarts alert calculations (if alerting is enabled) on the specified ports. When used with the **config** option, you must specify a port.

-lsubsecsevthresh severity_threshold

Specifies the threshold on the severity of latency in terms of the throughput loss on the port at the sub-second level. The severity threshold is a floating-point value in the range of no less than 1 and no greater than 1000. This value specifies the factor by which throughput must drop in a second in order for that second to be considered affected by latency bottlenecking. For example, a value of 20 means that the observed throughput in a second must be no more than 1/20th the capacity of the port in order for that second to be counted as an affected second. The default value is 50. This command erases the statistics history and restarts alert calculations (if alerting is enabled) on the specified ports. When used with the **config** option, you must specify a port.

--exclude [slot/]port_list

Excludes the specified ports from bottleneck detection. No data will be collected from these ports, and no alerts will be triggered for these ports. All statistics history for a port is erased when a port is excluded. Alerting parameters are preserved. It is not recommended to exclude ports from monitoring except under special circumstances, for example, when a long-distance port is known to be a bottleneck because of credit insufficiency. The wildcard (*) port specifier is allowed but not recommended. Use **--disable** to exclude all ports on the switch.

--include [slot/|port_list

Includes previously excluded ports for bottleneck detection. Previously configured switch-wide alerts and threshold parameters reapply when bottleneck detection resumes. The wildcard (*) port specifier may be used as a shorthand for removing all exclusions.

--configclear [slot/]port_list

Removes any port-specific alert parameters from the specified ports and restores switch-wide parameters on these ports. You can still view the history of bottlenecks statistics on these ports. However, alert calculations restart on the specified ports after the parameter reset. This operation is allowed on excluded ports.

--disable

Disables bottleneck detection on the entire switch. This operation erases all configuration details, including the list of excluded ports, all custom thresholds and alerting parameters for specific ports, and all historical data.

--show [[slot/]port |*]

Displays a history of the bottleneck severity for the specified ports. The output shows the percentage of one-second intervals affected by the bottleneck condition within the specified time interval. When a single port is specified, the command displays the bottleneck statistic for that port. When the wildcard (*) is specified, the same statistic is displayed for every port on the switch. Additionally, a combined "union" statistic for the switch as a whole is displayed. When used without a port

specifier, the command displays the number of ports affected by bottleneck conditions. A "bottlenecked" port in this output is defined as any port that was affected by a bottleneck for one second or more in the corresponding interval. This command succeeds only on online ports.

The following operands are optional:

-interval seconds

Specifies the time window in seconds over which the percentage of seconds affected by bottleneck conditions is displayed in the output. When a port is specified with the **--show** command, the maximum interval is 10800 seconds (3 hours). When a wildcard (*) is specified, the maximum interval is defined such that the value of **-span** divided by the value of the interval cannot exceed 30. The interval value must be greater than 0.The default value is 10 seconds.

-span seconds

Specifies the total duration in seconds covered in the output. When a port is specified with the **--show** command, the maximum span is 10800 seconds (3 hours). When a wildcard (*) is specified, the maximum span is defined such that the value of **-span** divided by the value of the interval cannot exceed 30. The span value must be greater than 0. The default value is 10 seconds.

History data are maintained for a maximum of three hours per port, so the span can be 10800 seconds at most. When the show command is issued for all ports (*), the maximum duration is defined such that the value of **-span** divided by the value of the interval cannot exceed 30.

-refresh

Refreshes the display to continuously update with fresh data at a certain rate. The refresh rate is equal to the number of seconds specified in the interval.

-congestion | -latency

Restricts the display to congestion or latency data. If neither is specified, the command displays combined statistics for both types of bottlenecks.

--status

Displays the details of the Bottleneck Detection configuration for the current (logical) switch. Refer to the command description section for an explanation of the displays. If virtual fabrics are enabled, ports not belonging to the current logical switch are not displayed.

--help

Displays the command usage.

Back-end port credit recovery commands

The following operands support back-end port credit recovery:

--cfgcredittools -intport

Enables credit recovery for internal back-end ports. Use one of the following recovery options:

-recover onLrOnly

Enables the back-end port recovery feature in link reset mode.

-recover onLrThresh

Enables the back-end port recovery feature in link reset threshold mode.

-recover off

Disables the back-end port credit recovery feature.

--showcredittools

Displays the back-end port credit recovery configuration as enabled or disabled. In addition, the output indicates whether link reset mode or link reset threshold mode is configured.

--help

Displays the command usage.

EXAMPLES Bottleneck detection examples

To enable bottleneck detection on the switch without alerts (statistics collected with default parameters are still available for viewing):

```
switch:admin> bottleneckmon --enable
```

To enable bottleneck detection on the switch with alerts using default values for thresholds and time (preferred use case):

```
switch:admin> bottleneckmon --enable -alert
```

To customize congestion bottleneck detection on a port range after default alerts are enabled switch-wide:

To disable bottleneck detection on a specified port:

```
switch:admin> bottleneckmon --exclude 2/4
```

To disable bottleneck detection on all ports of a chassis:

```
switch:admin> bottleneckmon --disable
```

To display the number of ports affected by bottleneck conditions:

						Number of	
Fron	n		To			bottlenecked ports

Back-end port credit recovery examples

0 1 Y 0.990 0.900

To enable back-end port credit recovery with the link reset only option and to display the configuration:

4000 600 4000 600

```
switch:admin> bottleneckmon --cfgcredittools \
    -intport -recover onLrOnly
switch:admin> bottleneckmon --showcredittools
Internal port credit recovery is Enabled with LrOnly
```

To enable back-end port credit recovery with the link reset threshold option and to display the configuration:

```
switch:admin> bottleneckmon --cfgcredittools -intport \
    -recover onLrThresh
switch:admin> bottleneckmon --showcredittools
Internal port credit recovery is Enabled with LrOnThresh
```

To disable back-end port credit recovery and to display the configuration:

```
switch:admin> bottleneckmon --cfgcredittools \
    -intport -recover off
switch:admin> bottleneckmon --showcredittools
Internal port credit recovery is Disabled
```

SEE ALSO None

bpPortLoopbackTest

Sends and receives data from the same BP port to perform a functional test of the port.

SYNOPSIS

bpportloopbacktest [--slot s/of]

[-nframes count] [-pklen count] [-lb_mode mode] [-spd_mode mode] [-bpports itemlist]

DESCRIPTION

Use this command to verify the functional operation of the switch. The test sends frames from a specified blade processor (BP) port transmitter and loops the frames back into the same BP port's receiver. The path exercised in this test includes the connections from the BP chip to the Control Processor (CP) chip. The test can be performed on a single port or on a range of BP ports.

Before running this diagnostic, you must disable the chassis and clear all logs using the following command sequence:

- 1. Execute chassisDisable
- 2. Execute slotStatsClear
- Execute diagClearError -all
- Execute cryptoCfg --disableEE (if the encryption engine is in enabled state)

By default, eight frames are transmitted and received on each port. The test method is as follows:

- Set all ports present for the loopback mode specified.
- 2. Create a frame F of maximum data size (2112 bytes).
- 3. Transmit frame F through the specified port.
- Pick up the frame from the same port.
- 5. Check if any of the following statistic error counters report nonzero values: ENC_in, CRC_err, TruncFrm, FrmTooLong, BadEOF, Enc_out, BadOrdSet, DiscC3.
- 6. Check if the transmit, receive, or class 3 receiver counters are stuck at some value.
- 7. Check if the number of frames transmitted is not equal to the number of frames received.
- Repeat steps two through seven for all specified ports until one of the following conditions is met:
 - a. The number of frames (or nframes) requested is reached.
 - b. All ports are marked bad.

At each pass, a different data type is used to create the frame from a palette of seven. If a pass of seven is requested, seven different frames are used in the test. If eight passes, the first seven frames are unique, and the eighth frame is the same as the first. The data palette of seven consists of the following data types:

```
1) CSPAT: 0x7e, 0x7e, 0x7e, 0x7e, ...
2) BYTE_LFSR: 0x69, 0x01, 0x02, 0x05, ...
3) CHALF_SQ: 0x4a, 0x4a, 0x4a, 0x4a, ...
4) QUAD_NOT: 0x00, 0xff, 0x00, 0xff, ...
5) CQTR_SQ: 0x78, 0x78, 0x78, 0x78, ...
6) CRPAT: 0xbc, 0xbc, 0x23, 0x47, ...
7) RANDOM: 0x25, 0x7f, 0x6e, 0x9a, ...
```

NOTES This command does not support High Availability (HA).

This command is currently supported only on the Brocade Encryption platform at a default speed of 4 Gbps and a loopback mode of 7. Use **portLoopBackTest** on all other platforms.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--slot slot

Specifies the slot number on bladed systems.

-nframes count

Specifies the number of frames to send. The test progresses until the specified number of frames has been transmitted on each port. The default value is 8.

-pklen count

Specifies the size of the packet to be sent. The default is 2112 bytes. The valid range is 100 to 2112 bytes.

-lb_mode mode

Specifies the loopback point for the test. The Brocade Encryption Platform, only supports line loopback (lb_mode 7) and **lb_mode** defaults to 7 when the parameter is not specified. Mode values are as follows:

1

Port Loopback (loopback plugs)

2

External (SERDES) loopback

7

Back-end bypass & port loopback

8

Back-end bypass & SERDES loopback

-spd mode mode

Specifies the speed mode for the test. On the Brocade Encryption platforms only a speed of 4 Gbps is supported and **spd_mode** defaults to 4 when the parameter is not specified.

1

Runs test at 1 Gbps (deprecated).

2

Runs test at 2 Gbps.

4

Runs test at 4 Gbps (Default for Encryption platforms).

8

Runs test at 8 Gbps (Default for Condor2).

16

Runs test at 16 Gbps (Condor3 only).

-bpports itemlist

Specifies a list of blade ports to test. By default all valid blade ports in the specified blade are tested. On the Brocade Encryption platforms, ports 80-103 are the only valid ports, because these are the only blade ports with access to the Vader chip. Refer to the **itemList** help page for further information on the *itemList* parameter.

DIAGNOSTICS

When it detects failures, the test may report one or more of the following error messages. If errors persist, contact Technical Support.

DATA

Data received does not match the data sent.

ERRSTAT

Errors were found in the ASIC statistics.

INIT

Port failed to initialize.

PORTDIED

A previously initialized port went to an un-initialized state.

STATS

Errors were found in the ASIC statistics.

TIMEOUT

Did not receive a frame in the given timeout period.

XMIT

Frame transmission failure.

EXAMPLES

To run the test on blade ports 80-90 with one frame:

```
switch:admin> bpportloopbacktest -bpports 80-90 -nframes 1
Running bpportloopbacktest ...............
Ram Init
Obl portloopbacktest on ports 80-90 lbMode 7 speed 4
Info: Vader port 0 recovering Rx Fifo
Info: Vader port 1 recovering Rx Fifo
Info: Vader port 2 recovering Rx Fifo
Info: Vader port 3 recovering Rx Fifo
Info: Vader port 4 recovering Rx Fifo
Info: Vader port 5 recovering Rx Fifo
Obl portloopbacktest on ports 80-90 PASSED
Test Complete: bpportloopbacktest Pass 1 of 1
Duration 0 hr, 0 min & 24 sec (0:0:24:599).
Cleaning up after test......
passed.
```

SEE ALSO itemList, portLoopbackTest

bpTurboRamTest

MBIST test for AP Blade BP ASICs.

SYNOPSIS

bpturboramtest [--slot slot]

[-passcnt count] [-bpports itemlist]

DESCRIPTION

Use this command to verify the on-chip static random access memory (SRAM) located in the Blade Processor (BP) ASICs of the Application Processor (AP) blade. The command makes use of the memory built-in self-test (MBIST) circuitry.

Before running this diagnostics, you must disable the chassis and clear all logs using the following command sequence:

- 1. Execute chassisdisable
- 2. Execute slotstatsclear
- 3. Execute diagclearerror -all
- 4. Execute **cryptocfg** --**disableEE** (if the encryption engine is in enabled state)

The test flow for each SRAM is as follows:

- 1. Fill RAM with alternating FFFF 0000 pattern. (Subtest 1: turboram memory fill)
- 2. For each incrementing address read FFFF 0000 pattern and write 0000 FFFF. (Subtest 2: turboram r-m-w inc 1)
- 3. For each incrementing address read 0000 FFFF pattern and write FFFF 0000. (Subtest 3: turboram r-m-w inc 2)
- 4. For each decrementing address read FFFF 0000 pattern and write 0000 FFFF. (Subtest 4: turboram r-m-w dec 1)
- 5. For each decrementing address read 0000 FFFF pattern and write FFFF 0000. (Subtest 5: turboram r-m-w dec 2)
- 6. Repeat steps 1-5 with AAAA 5555 pattern.

NOTES

This command is supported only on the Brocade Encryption Switch. It complements the **bpTurboramTest**, which tests the Condor2 ASIC on the switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--slot slot

Specifies the slot number on bladed systems.

-passcnt count

Specifies the number of test repetitions. By default the test runs once.

-bpports itemlist

Specifies a list of blade ports to test. By default all blade ports in the specified blade are tested. Note that on the Encryption platform, ports 80-103 are the blade ports connected to the BP ASICs. Refer to the **itemList** help page for further information on the *itemlist* parameter.

EXAMPLES To run the test in default mode:

switch:admin> bpturboramtest Running bpturboramtest Board Init Running Vader bist test Vader bist test PASSED Running Obl bist test Obl bist test PASSED BIST test PASSED on all ASIC(s) Test Complete: bpturboramtest Pass 1 of 1 Duration 0 hr, 1 min & 55 sec (0:1:55:884). Cleaning up after test..... passed.

SEE ALSO turboRamTest

bufOpMode

Changes or displays the Buffer Optimized Mode.

SYNOPSIS

bufopmode --set slot [-f]

bufopmode --reset slot

bufopmode --show slot

bufopmode --showall

DESCRIPTION

Use this command to display or change the buffer optimized mode on a switch.

When buffer optimized mode is enabled on a slot, additional buffers are allocated on the internal ports. Use this feature, if you have slow draining devices connected to the slot and there are no long distance links or F_Port buffers configured on that slot.

You must power off the slot before changing the buffer optimized mode. Changes take effect immediately after the slot is powered on

Enabling buffer optimized mode removes all long distance configurations or F_Port buffers on that slot. You will be prompted if any F_Port buffers or long distance configurations are detected.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only on the Brocade FC8-16, FC8-32, and FC8-48 blades in a DCX or DCX-4S chassis. An asterisk (*) next to the slot configuration status indicates an unsupported blade. Refer to the example section for an illustration.

This command is not supported on Control Processor (CP) blades and core blades.

OPERANDS

This command has the following operands:

slot

Specifies the slot number.

--set

Enables buffer optimized mode on the specified slot. This commands prompts for confirmation before removing any F_Port buffers or long distance configurations on that slot. Use the **-f** option to execute this command without confirmation.

--reset

Clears buffer optimized mode on the specified slot.

--show

Displays the current buffer optimized mode for the specified slot (On or Off).

--showall

Displays the current buffer optimized mode for all slots. An asterisk (*) next to the slot configuration status indicates an unsupported blade.

EXAMPLES

To display the buffer optimized mode for all slots on a DCX with supported blades:

```
switch:admin> bufopmode --showall
Slot 1: buffer optimized mode - Off
Slot 2: buffer optimized mode - Off
Slot 3: buffer optimized mode - Off
Slot 4: buffer optimized mode - Off
```

```
Slot 9: buffer optimized mode - Off
Slot 10: buffer optimized mode - Off
Slot 11: buffer optimized mode - Off
Slot 12: buffer optimized mode - On
_____
* indicates buffer optimization not supported on this blade
```

To display current buffer optimized mode for a single slot

```
switch:admin> bufopmode --show 12
Slot 12: buffer optimized mode - On
```

To enable buffer optimized mode for a given slot:

```
switch:admin> bufopmode --set 11
The slot must first be powered off to perform this operation
switch:admin> bufopmode --reset 12
The slot must first be powered off to perform this operation
switch:admin> slotpoweroff 11
switch:admin> slotpoweroff 12
switch:admin> bufopmode --set 12
Buffer optimized mode is turned on for slot 11
switch:admin> bufopmode --reset 12
Buffer optimized mode is turned off for slot 12
switch:admin> slotpoweron 11
switch:admin> slotpoweron 12
```

To display the changes:

```
switch:admin> bufopmode --showall
Slot 1: buffer optimized mode - Off
Slot 2: buffer optimized mode - Off
Slot 3: buffer optimized mode - Off
Slot 4: buffer optimized mode - On
Slot 9: buffer optimized mode - Off
Slot 10: buffer optimized mode - Off
Slot 11: buffer optimized mode - On
Slot 12: buffer optimized mode - Off
_____
* indicates buffer optimization not supported on this blade
```

To display the buffer optimized mode for all slots on a DCX 8510-8 with unsupported 16G port blades:

```
switch:admin> bufopmode --showall
```

```
Slot 1: buffer optimized mode - Off*
Slot 2: buffer optimized mode - Off*
Slot 3: buffer optimized mode - Off*
Slot 4: buffer optimized mode - Off*
Slot 9: buffer optimized mode - Off*
Slot 10: buffer optimized mode - Off*
```

```
Slot 11: buffer optimized mode - Off*
Slot 12: buffer optimized mode - Off*

* indicates buffer optimization not supported on this blade
```

cfgActvShow

Displays effective zone configuration information.

SYNOPSIS cfgactvshow

DESCRIPTION Use this command to display the effective zone configuration information.

The current configuration is a single zone configuration that is currently in effect. The devices that an initiator sees are based on this configuration. The effective configuration is built when a specified zone

configuration is enabled.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the effective zone configuration information:

switch:admin> cfgactvshow
Effective configuration:
cfg: c4

zone: z3 33:07:06:05:04:03:02:01 zone: z4 44:01:23:45:67:89:a0:bc

40:01:23:45:67:89:a0:bc

SEE ALSO cfgClear, cfgDelete, cfgRemove, cfgSave, cfgShow

cfgAdd

Adds a member to a zone configuration.

SYNOPSIS cfgadd "cfgName", "member[; member...]"

DESCRIPTION Use this command to add one or more members to an existing zone configuration.

> This command changes the Defined Configuration. For the change to take effect, enable the configuration with the cfgEnable command. For the change to be preserved across switch reboots, save

the configuration to nonvolatile memory with the cfgSave command.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS The following operands are required:

"cfgName"

Specify a name for the zone configuration, enclosed in double quotation marks.

"member"

Specify a zone member or a list of zone members to be added to the configuration. The list must be enclosed in double quotation marks. Members

must be separated by semicolons.

EXAMPLES To add two new zones to the configuration "Test_cfg":

switch:admin> cfgadd "Test_cfg", "greenzone;bluezone"

SEE ALSO cfgClear, cfgCreate, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgShow

cfgClear

Clears all zone configurations.

SYNOPSIS

cfgclear

DESCRIPTION

Use this command to clear all zone information in the transaction buffer. All defined zone objects in the transaction buffer are deleted. If an attempt is made to commit the empty transaction buffer while a zone configuration is enabled, you are warned to first disable the enabled zone configuration or to provide a valid configuration with the same name.

After clearing the transaction buffer with the **cfgClear** command, use the **cfgDisable** command to clear the entire zoning configuration (both the transaction buffer and the active configuration). If there is no current active zoning configuration, or you just want to clear the transaction buffer, use the **cfgSave** command to commit the transaction.

If the default zone access mode is "No Access", this command recreates the default zoning objects.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

None

EXAMPLES

To clear all zones and then clear nonvolatile memory:

```
switch:admin> cfgclear
The Clear All action will clear all Aliases, Zones, FA Zones
and configurations in the Defined configuration.
Run cfgSave to commit the transaction or cfgTransAbort to
cancel the transaction.
Do you really want to clear all configurations? \
  (yes, y, no, n): [no] n
switch:admin> cfgsave
You are about to save the Defined zoning configuration. This
action will only save the changes on Defined configuration.
Any changes made on the Effective configuration will not
take effect until it is re-enabled. Until the Effective
configuration is re-enabled, merging new switches into the
fabric is not recommended and may cause unpredictable
results with the potential of mismatched Effective Zoning
configurations.
Do you want to save Defined zoning configuration only? \setminus
   (yes, y, no, n): [no]n
```

SEE ALSO cfgDisable, cfgEnable, cfgSave

cfgCreate

Creates a zone configuration.

SYNOPSIS

cfgcreate "cfgName", "member[;member...]"

DESCRIPTION

Use this command to create a new zone configuration.

This command changes the Defined Configuration (see cfgShow). For the change to become effective, enable the configuration with the cfgEnable command. For the change to be preserved across switch reboots, save the configuration to nonvolatile memory with the **cfgSave** command.

Refer to the **zoneCreate** command for more information on *name* and *member* specifications.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

The following operands are required:

"cfgName"

Specify a name for the zone configuration in double quotation marks. A zone configuration name must begin with a letter followed by any number of letters, numbers, and underscores. Names are case-sensitive. For example, "Cfg_1" and "cfg_1" are different zone configurations. Blank spaces are ignored.

"member"

Specify a zone member or list of zone members to be added to the configuration. The list must be enclosed in double quotation marks. Members must be separated by semicolons. The zone configuration member list must have at least one member. Empty member lists are not allowed.

EXAMPLES

To create a configuration containing three zones:

```
switch:admin> cfgcreate "USA_cfg",
"Purple_zone; Blue_zone; Green_zone"
```

SEE ALSO

cfgAdd, cfgClear, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgShow

cfgDelete

Deletes a zone configuration.

SYNOPSIS cfgdelete "cfgName"

DESCRIPTION Use this command to delete a zone configuration.

This command changes the Defined Configuration (see **cfgShow**). For the change to become effective, enable the configuration with the **cfgEnable** command. For the change to be preserved across switch

reboots, save the configuration to nonvolatile memory with the **cfgSave** command.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS The following operand is required:

"cfgName"

Specify a name for the zone configuration to be deleted. The name must be

enclosed in double quotation marks.

EXAMPLES To delete a zone configuration:

switch:admin> cfgdelete "USA_cfg"

SEE ALSO cfgAdd, cfgClear, cfgCreate, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgShow

cfgDisable

Disables a zone configuration.

SYNOPSIS cfqdisable

DESCRIPTION

Use this command to disable the current zone configuration. The fabric returns to non-zoning mode, a mode in which all devices can see each other.

This command ends and commits the current zoning transaction buffer to both volatile and nonvolatile memory. If a transaction is open on a different switch in the fabric when this command is run, the transaction on the other switch is automatically aborted. A message displays on the other switches to indicate that the transaction was aborted.

If the default zone access mode is "No Access", then this command becomes equivalent to cfqEnable "d efault Cfg". Refer to defZone help for information on zone access configuration.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS None

EXAMPLES

To disable the current zone configuration:

```
switch:admin> cfgdisable
You are about to disable zoning configuration. This
action will disable any previous zoning configuration.
Do you want to disable zoning configuration? \
    (yes, y, no, n): [no] y
```

SEE ALSO

cfgClear, cfgEnable, cfgSave

cfgEnable

Enables a zone configuration.

SYNOPSIS cfgenable "cfgName"

DESCRIPTION

Use this command to enable a zone configuration. The command builds the specified zone configuration . It checks for undefined zone names, zone alias names, or other inconsistencies, by expanding zone aliases, removing duplicate entries, and then installing the effective configuration.

If the build fails, the previous state is preserved (zoning remains disabled, or the previous effective configuration remains in effect). If the build succeeds, the new configuration replaces the previous configuration. Refer to the **cfgShow** command for a description of the defined and effective configurations.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

The following operand is required:

"cfgName"

Specifies the name of the zone configuration. The name must be enclosed in double quotation marks.

EXAMPLES

To enable the zone configuration USA_cfg:

SEE ALSO

cfgClear, cfgDisable, cfgSave, cfgShow

cfgRemove

Removes a member from a zone configuration.

SYNOPSIS

cfgremove "cfgName", "member[; member...]"

DESCRIPTION

Use this command to remove one or more members from an existing zone configuration. If all members are removed, the zone configuration is deleted.

This command changes the Defined Configuration (see cfgShow). For the change to become effective, enable the configuration with the cfgEnable command. For the change to be preserved across switch reboots, save the configuration to nonvolatile memory with the cfgSave command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

The following operands are required:

"cfgName"

Specify a name for the zone configuration, enclosed in double quotation marks.

"member"

Specify a zone member or a list of zone members to be removed from the configuration. The list must be enclosed in double quotation marks. Members must be separated by semicolons.

EXAMPLES

To remove a zone from a configuration:

switch:admin> cfgremove "Test_cfg", "bluezone"

SEE ALSO

cfgAdd, cfgClear, cfgCreate, cfgDelete, cfgDisable, cfgEnable, cfgSave, cfgShow, cfgTransAbort, cfqTransShow

cfgSave

Saves the zone configuration to nonvolatile memory.

SYNOPSIS

cfqsave

DESCRIPTION

Use this command to save the current zone configuration. This command writes the defined configuration and the name of the effective configuration to nonvolatile memory in all switches in the fabric.

The saved configuration is automatically reloaded at power on, and, if a configuration was in effect at the time it was saved, the same configuration is reinstalled with an automatic **cfgEnable** command.

Because the saved configuration is reloaded at power on, only valid configurations are saved. The **cfgSave** command validates the effective configuration by performing the same tests as the **cfgEnable** command. If the tests fail, an error message is displayed and the configuration is not saved.

This command ends and commits the current transaction. If a transaction is open on a different switch in the fabric when this command is run, the transaction on the other switch is automatically aborted. A message displays on the other switches to indicate that the transaction was aborted.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS None

EXAMPLES

To save a zone configuration:

switch:admin> cfgsave

You are about to save the Defined zoning configuration. This action will only save the changes on Defined configuration. Any changes made on the Effective configuration will not take effect until it is re-enabled. Until the Effective configuration is re-enabled, merging new switches into the fabric is not recommended and may cause unpredictable results with the potential of mismatched Effective Zoning configurations.

Do you want to save Defined zoning configuration only? (yes, y, no, n): [no]y

SEE ALSO

 ${\tt cfgAdd, cfgClear, cfgCreate, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgShow, cfgTransAbort, cfgTransShow}$

cfgShow

Displays zone configuration information.

SYNOPSIS

cfqshow ["pattern"] [, mode]

DESCRIPTION

Use this command to display zone configuration information.

If no operand is specified, all zone configuration information (both defined and effective) is displayed. If the local switch has an outstanding transaction, this command displays the most recently edited zone configuration that has not yet been saved. If the local switch has no outstanding transaction, this command displays the committed zone configuration.

If a pattern is specified, only matching configurations are displayed.

- The **defined configuration** is the complete set of all zone objects that have been defined in the fabric. There can be multiple zone configurations defined, but only one can be enabled at a time. There might be inconsistencies in the definitions, zones, or aliases that are referenced but not defined, or there might be duplicate members. The defined configuration is the current state of the administrator input.
- The effective configuration is the single zone configuration that is currently enabled. The devices that an initiator sees in the fabric are based on this configuration. The effective configuration is built when a specific zone configuration is enabled and all error checking has been completed successfully.

When this command is executed after a zoning transaction was aborted on the local switch, it displays the following warning message: "Warning: Current Zoning Transaction was aborted. Reason code = Zone Config update received."

When default zoning is enabled with "No Access" mode, "No Effective configuration: (No Access)" is displayed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operands are optional:

"pattern"

A regular expression that matches zone configuration names. The pattern must be enclosed in quotation marks and can contain the following:

Question mark (?)

Matches any single character

Asterisk (*)

Matches any string of characters.

Range

Matches any character within the range. Ranges must be enclosed in square brackets, for example, [0-9] or [a-f].

mode

Specify 0 to display the contents of the transaction buffer (the contents of the current transaction) or specify 1 to display the contents of nonvolatile memory. The default value is 0.

EXAMPLES To display all zone configurations that start with "Test":

```
switch:admin> cfgshow "Test*"
cfg: Test1 Blue_zone
cfg: Test_cfg Red_zone; Blue_zone
```

To display all zone configuration information:

```
switch:admin> cfgshow
Defined configuration:
cfg: USA1 Blue_zone
cfg: USA_cfg Red_zone; Blue_zone
zone: Blue_zone
       1,1; array1; 1,2; array2
zone: Red_zone
       1,0; loop1
alias: array1 21:00:00:20:37:0c:76:8c; \
     21:00:00:20:37:0c:71:02
alias: array2 21:00:00:20:37:0c:76:22; \
     21:00:00:20:37:0c:76:28
alias: loop1 21:00:00:20:37:0c:76:85; \
     21:00:00:20:37:0c:71:df
Effective configuration:
cfg: USA_cfg
zone: Blue_zone
       1,1
       21:00:00:20:37:0c:76:8c
       21:00:00:20:37:0c:71:02
       1,2
       21:00:00:20:37:0c:76:22
       21:00:00:20:37:0c:76:28
zone: Red_zone
       1,0
       21:00:00:20:37:0c:76:85
       21:00:00:20:37:0c:71:df
```

To display only configuration names:

```
switch:admin> cfgshow "*"
cfg: USA1 Blue_zone
cfg: USA_cfg Red_zone; Blue_zone
```

SEE ALSO cfgAdd, cfgClear, cfgCreate, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgTransAbort, cfgTransShow

cfgSize

Displays zone and Admin Domain database size details.

SYNOPSIS

cfqsize [integer]

DESCRIPTION

Use this command to display the size details of the zone database and the Admin Domain database.

When executed in a non-AD255 context, the size details include maximum size, the committed size, and the transaction size of the Zone database in bytes.

When executed in an AD255 context, this command displays the maximum size for the Admin Domain and Zone database, the Admin Domain header size, and the zone database sizes for each Admin Domain:

Zone DB maximum size

Defines the upper limit for both Zone and Admin Domain defined configuration, determined by the amount of nonvolatile memory available for storing the defined configuration. The Zone DB maximum size is further reduced due to a message header that is propagated with the zone configuration to all switches in the fabric.

The maximum supported zone database size per chassis is 1 MB.

Available Zone DB size

Displays the size of the database that is actually available for storage.

Committed size

Displays the size of the defined configuration currently stored in nonvolatile memory.

Transaction size

Displays the size of the uncommitted defined configuration. This value will be nonzero if the defined configuration is being modified by Telnet, API, and so forth; otherwise it is 0.

Refer to the cfgShow help page for a description of defined and effective zone configurations. Refer to the **ad** help page for a description of the defined and the effective Admin Domain configurations.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

In Virtual Fabric environments, the zone database size of all partitions taken together cannot exceed 1 MB. Exceeding the 1 MB chassis zone database size limit can result in unexpected behavior. Note that in Virtual Fabric mode, the zone database limit is enforced per partition, but not chassis-wide.

OPERANDS

The following operand is optional:

integer

If a nonzero integer is specified, the size of the nonvolatile memory allocated for the zone database is displayed. The zone database includes both the defined and effective configurations. The database size is displayed in bytes.

EXAMPLES To display the zone database on a Brocade 6510

To display Admin Domain and zone database size information in an AD255 context:

```
switch:admin> cfgsize
Maximum AD and Zone DB size
                                 - 1045274 bytes
Total Committed AD and Zone DB size - 3390 bytes
AD and Zone DB uncommitted space available - 1041884 bytes
Total AD and Zone Transaction buffer size -
AD Database Size:
-----
  committed -
               3124 bytes
transaction -
                   0 bytes
Number of ADs in Effective Configuration - 4
Each AD's Zone Database Size:
_____
cfgsize Info for AD Number: 0 (AD Name: ADO, State=Active):
               242 bytes
   committed -
 transaction -
                    0 bytes
cfgsize Info for AD Number:1 (AD Name: AD1, State=Active):
   committed - 16 bytes
 transaction -
               0 bytes
cfgsize Info for AD Number:2 (AD Name: AD2, State=Active):
   committed - 4 bytes
 transaction - 0 bytes
cfgsize Info for AD Number: 3 (AD Name: AD3, State=Active):
   committed - 4 bytes
 transaction - 0 bytes
```

SEE ALSO ad, cfgShow, zoneHelp

cfgTransAbort

Aborts the current zoning transaction.

SYNOPSIS cfgtransabort [token]

DESCRIPTION Use this command to abort the current zoning transaction without committing it. All changes made since

the transaction was started are removed and the zone configuration database is restored to the state

before the transaction was started.

If a transaction is open on a different switch in the fabric when this command is run, the transaction on

the other switch remains open and unaffected.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS When invoked without an operand, this command aborts the current transaction. The following operand

is optional:

token

Specify the token ID of the transaction to be aborted. Use the cfgTransShow

command to obtain the token ID of a transaction.

EXAMPLES To abort the current transaction:

switch:admin> cfgtransabort

SEE ALSO cfgAdd, cfgClear, cfgCreate, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgShow,

cfgTransShow

cfgTransShow

Displays information about the current zoning transaction.

SYNOPSIS cfgtransshow

DESCRIPTION

Use this command to display the ID of the current zoning transaction. In addition, the command provides information on whether or not the transaction can be aborted. The transaction cannot be aborted if it is an internal zoning transaction.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS None

EXAMPLES To display the current transaction:

```
switch:admin> cfgtransshow
There is no outstanding zone transaction

switch:admin> cfgclear
Do you really want to clear all configurations? \
    (yes, y, no, n): [no] y
Clearing All zoning configurations...

switch:admin> cfgtransshow
Current transaction token is 271010736
It is abortable
```

SEE ALSO

cfgAdd, cfgClear, cfgCreate, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgShow, cfgTransAbort

chassisBeacon

Sets chassis beaconing mode.

SYNOPSIS chassisbeacon [mode]

DESCRIPTION

Use this command to enable or disable beaconing on a chassis. Chassis beaconing can be used to locate a failing chassis in a group of chassis. Use the **portBeacon** command to locate a failing port, and use the **switchBeacon** command to locate a failing (logical) switch.

When beaconing mode is turned on, the port LEDs flash green at various rates across the chassis. The beaconing continues until you turn it off.

Beaconing mode takes over the port LEDs. The normal flashing LED pattern associated with an active, faulty, or disabled port is suppressed, and only the beaconing pattern is shown. Other commands are still executable and functional. However, if diagnostic frame-based tests such as **portLoopbackTest** are executed, the diagnostic LED pattern is interleaved with the beaconing pattern.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

mode

Specify 1 to enable chassis beaconing mode or 0 to disable beaconing mode. This operand is optional. If no operand is specified, the current value is displayed.

EXAMPLES

To turn chassis beaconing mode on:

switch:admin> chassisbeacon 1
Chassis beacon success 1

To turn beaconing mode off:

switch:admin> chassisbeacon 0
Chassis beacon success 0

SEE ALSO

portBeacon, switchShow, switchBeacon

chassisDisable

Disables all user ports in a chassis.

SYNOPSIS chassisdisable [-force]

DESCRIPTION

Use this command to disable a Virtual Fabric-aware chassis. All Fibre Channel ports are taken offline. This command prompts for confirmation unless the **-force** option is used. If the chassis is partitioned into logical switches that are part of logical fabrics, the remaining switches in these fabrics reconfigure. As each port is disabled, the front panel LED changes to a slow-flashing amber.

You must disable the chassis before making configuration changes or running offline diagnostic tests. Commands that require the chassis to be disabled generate an error message if invoked while the chassis is enabled. It is not necessary to disable a chassis before rebooting or powering off the switch.

To disable the ports of a single logical switch, use the **switchDisable** command. To disable the ports of a single blade, use the **bladeDisable** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS -force

Disables the chassis without confirmation. This operand is optional.

EXAMPLES To disable a chassis:

```
switch:admin> chassisdisable
This command can cause disruption to\
    multiple logical switches.
Are you sure you want to disable all chassis ports now?\
    (yes, y, no, n): [no]y
```

SEE ALSO

 $blade Disable, \ blade Enable, \ chassis Enable, \ switch Show, \ switch Disable, \ switch Enable, \ switch Cfg Persistent Enable, \ switch Cfg Persistent Disable$

chassisDistribute

Distributes IP filter policies.

SYNOPSIS

chassisdistribute -db policy_db -fid FID [-force]

chassisdistribute -db policy_db -domain domain_list [-force]

DESCRIPTION

Use this command to manually distribute IP Filter policies. The behavior of this command depends on whether Virtual Fabrics are enabled or disabled.

- In Virtual Fabric mode, this command distributes the IP filter policy databases from a specified logical switch to all chassis that are connected through the logical switch on which the command is issued.
- If Virtual fabrics are disabled, the IP filter policy databases are distributed to a specified list of Domain IDs.

This command distributes the entire database and overwrites any existing data on the receiving switches. The **chassisDistribute** command does not enforce FCS policy.

The target chassis or switches must be capable of accepting the distribution. The distribution is aborted if one of the connected chassis or domains is configured to reject the distribution. Use the **fddCfg** command to configure the fabric-wide policies that control distribution behavior.

The command output includes the following information:

FID

Indicates whether Virtual Fabrics are enabled or not on the domain that receives the distribution. If Virtual Fabrics are enabled, the FID is displayed, and all logical switches which are part of the chassis are targeted to receive the distribution.

DOMAIN

Displays the Domain ID of the originating switch.

CHASSISWWN

Displays the WWN of the originating or receiving chassis. Displays the originating switch WWN in switches running Fabric OS versions that do not support the chassis WWN feature.

CHASSISNAME

Displays the name of the chassis.

SUPPORTED_DIST

Displays yes if the distribution is supported on the receiving chassis. Displays no if the distribution is not supported.

This command distributes IP Filter policies only. To distribute other security policies, use the **distribute** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-db policy_list

Specifies the list of policy sets, also called security databases, to be distributed. Currently, only the IPFILTER policy database can be distributed with this command. The policy list must be enclosed in double quotation marks; members must be separated by semicolons. The following operands are mutually exclusive:

-fid FID

Specifies the logical switch from which the distribution should originate. The logical switch is identified by its fabric ID (FID). When a FID is specified, the database is distributed to all chassis that are connected to the logical switch and are configured to accept the distribution. This operand is required and valid only when the switch is in Virtual Fabric mode.

-domain domain list

Specifies a list of switch domain IDs that should receive the database. The list must be enclosed in double quotation marks; members must be separated by a semicolon. A wildcard (*) may be specified to include all switches in the fabric that support the distribute feature. This operand is required and valid only when Virtual Fabrics are disabled.

-force

Distributes the database without confirmation.

EXAMPLES

To distribute the IP Filter policies to all chassis that are connected through the logical fabric 128 and support the distribute feature:

To distribute the IP Filter policies to all switches in the fabric that support the distribute feature (Virtual Fabrics are disabled on the evoking switch):

SEE ALSO distribute, fddCfg

chassisEnable

Enables all user ports in a chassis.

SYNOPSIS chassisenable

DESCRIPTION

Use this command to enable a Virtual Fabric-aware chassis. All Fibre Channel ports that passed the power-on self test (POST) are enabled. They may come online if connected to a device, or remain offline if disconnected. Use **chassisEnable** to re-enable the chassis after making configuration changes or running offline diagnostics.

If the chassis is partitioned into multiple logical switches and physically connected to multiple logical fabrics, the logical switches rejoin their fabrics.

As each port is enabled, the front panel LED changes from slow-flashing amber to nonflashing green for online ports, or to nonflashing amber for ports that do not initialize. Disconnected ports remain unlit. Loopback ports slowly flash green when online.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To enable a chassis:

switch:admin> chassisenable

SEE ALSO

bladeDisable, bladeEnable, chassisDisable, switchShow, switchDisable, switchEnable, switchCfgPersistentEnable, switchCfgPersistentDisable

chassisName

Displays or sets the chassis name.

SYNOPSIS chassisname [name]

DESCRIPTION Use this command to display or change the name associated with the chassis.

Use this command without parameters to display the current chassis name. Use this command with the

name operand to assign a new chassis name.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

name

Specify a new name for the chassis, optionally in double quotation marks. A chassis name can include up to 31 characters. A chassis name must begin with a letter, and can consist of letters, numbers, underscore or hyphen characters.

Spaces are not permitted.

EXAMPLES To change the chassis name to "dilbert":

switch:admin> chassisname dilbert

switch:admin> chassisname

dilbert

SEE ALSO switchName

chassisShow

Displays all field replaceable units (FRUs).

SYNOPSIS chassisshow

DESCRIPTION

Use this command to display the Field Replaceable Unit (FR) header content for each object in the chassis and chassis backplane version. This command displays the following information:

- 1. The chassis family, for example, DCX 8510.
- 2. The backplane version number, in hexadecimal: Chassis Backplane Revision: xx
- 3. The first line of each record contains the object ID. If the FRU is part of an assembly, a brief description is displayed in parentheses.
 - a. Object type: CHASSIS, FAN, POWER SUPPLY, SW BLADE (switch), CP BLADE (control processor), WWN (world wide name), or UNKNOWN.
 - b. Object number: Slot *nn* (for blades), Unit *nn* (for everything else).
- 4. FRU header version number: Header Version: x
- 5. A value to calculate the object's power consumption: positive for power supplies and negative for consumers. Power Consume Factor: -xxx
- 6. A value for real-time power consumption is displayed for each FRU that supports real-time power measurement. When the capability is not supported for a FRU, the line is suppressed. Power Usage (Watts):
- 7. Factory part number (up to 14 characters): Factory Part Num: xx-xxxxxx-xx
- 8. Factory serial number (up to 12 characters): Factory Serial Num:xxxxxxxxxx
- 9. FRU manufacture date: Manufacture: Day: dd Month: mm Year: yyyy
- 10. Date of the last FRU header update: Update: Day: dd Month: mm Year: yyyy
- 11. Cumulative number of days the FRU has been powered on: Time Alive: dddd days
- 12. Time elapsed, in days, since the FRU was last powered on: Time Awake: dddd days
- 13. Externally supplied ID (up to 10 characters): ID: xxxxxxxxx
- 14. Externally supplied part number (up to 20 characters): Part Num: xxxxxxxxxxxxxxxxxxxx
- 16. Externally supplied revision number (up to 4 characters): Revision Num: xxxx

The output of this command depends on the platforms on which it is executed. On some platforms, for certain FRU types, a few items may not be available. In these cases, the lines are suppressed. Possibly affected lines are 1, 3 through 7, 9, and 11 through 14. In addition, for lines 11 through 14, if there is no data set, these lines are suppressed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display the FRUs for a DCX 8510-8:

```
switch:user> chassisshow
```

Chassis Family: DCX8510-8 Chassis Backplane Revision: 0

SW BLADE Slot: 1

Header Version: 2
Power Consume Factor: -180
Power Usage (Watts): -286

Factory Part Num: 60-1002144-02

Manufacture: Day: 16 Month: 11 Year: 2010 Update: Day: 19 Month: 2 Year: 2011

Time Alive: 39 days
Time Awake: 1 days

(output truncated)

SEE ALSO slotShow

classConfig

Displays RBAC class permissions.

SYNOPSIS

classconfig --show class name | -all | -classlist

classconfig --showcli command

classconfig --showroles class_name

classconfig --help

DESCRIPTION

Use this command to display information about role-based access control (RBAC) permissions for one or all meta-object format (MOF) classes, to display permissions for a specified command, or to display the permissions for a specified MOF class.

Fabric OS commands are grouped into feature sets called MOF classes. For example, the commands IdapCfg, passwd, passwdCfg, and userConfig are all related to User Management and are therefore grouped together under a MOF class called **UserManagement**.

The pre-defined roles Root, Factory, Admin, User, SwitchAdmin, ZoneAdmin, FabricAdmin, BasicSwitchAdmin, SecurityAdmin and Operator provide a mechanism for further restricting access to commands of a certain class by role-specific permissions. For example, a user with the ZoneAdmin role will have access to the commands under the MOF class Zoning but not to those under the UserManagement class.

The following RBAC permissions are supported in Fabric OS:

- O = observe
- OM = observe-modify
- N = no access

Note that the MOF class level permissions extend to all commands in that class, but not necessarily to each and every command option. For example, a command may have the RBAC class permission of "OM", but a show only option under that command may have the permission "O". At the role level, a certain role may be excluded from viewing the command information, in which case the permission for that role would be "N".

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following optional operand:

--show

Displays RBAC permission information. One of the following operands is required:

class name or -all

Displays permissions for a single MOF class or for all classes. The output displays the class name, the CLIs grouped under the specified class, the command options, and the RBAC class permissions for each command option.

-classlist

Displays an alphabetical listing of all MOF classes supported in Fabric OS.

--showcli command

Displays the RBAC permissions for the specified command and associated command options. The output displays the command name, the command options, the RBAC class permissions for each command option, and the MOF class.

--showroles class_name

Displays the role permissions the specified MOF class.

--help

Displays the command usage.

EXAMPLES To display an alphabetical listing of all MOF classes supported in Fabric OS:

switch:admin> classconfig --show -classlist

List of RBAC classes:

- 1. AdminDomains
- 2. ADSelect
- 3. AG
- 4. APM
- 5. Audit
- 6. Authentication
- 7. Blade
- 8. ChassisConfiguration
- 9. ChassisManagement
- 10. ConfigManagement
- 11. Configure
- 12. DCE
- 13. Debug
- 14. Diagnostics
- 15. DMM
- 16. EncryptionConfiguration
- 17. EncryptionManagement
- 18. EthernetConfig
- 19. Fabric
- 20. FabricDistribution
- 21. FabricRouting
- 22. FabricWatch
- 23. Factory
- 24. FCoE
- 25. FICON
- 26. FIPSBootprom
- 27. FIPSCfg
- 28. FirmwareKeyManagement
- 29. FirmwareManagement
- 30. FRUManagement
- 31. HA
- 32. IPfilter
- 33. IPSec
- 34. ISCSI
- 35. License
- 36. LocalUserEnvironment
- 37. Logging
- 38. LogSupportsave
- 39. ManagementAccessConfiguration
- 40. ManagementServer
- 41. NameServer
- 42. Nocheck
- 43. NxPortManagement
- 44. PhysicalComputerSystem
- 45. PKI

- 46. PortMirror
- 47. RADIUS
- 48. Reboot
- 49. Restricted
- 50. RoleConfig
- 51. RoutingAdvanced
- 52. RoutingBasic
- 53. Security
- 54. SessionManagement
- 55. SNMP
- 56. Statistics
- 57. StatisticsDevice
- 58. StatisticsPort
- 59. SwitchConfiguration
- 60. SwitchManagement
- 61. SwitchManagementIPConfiguration
- 62. SwitchPortConfiguration
- 63. SwitchPortManagement
- 64. Topology
- 65. USBManagement
- 66. UserManagement
- 67. WWNCard
- 68. Zoning

To display the RBAC permissions for the commands included in the UserManagement class:

switch:admin> classconfig --show UserManagement

RBAC class Name : UserManagement

CLI	Option	Permission
ldapcfg	help	0
ldapcfg	maprole	OM
ldapcfg	show	0
ldapcfg	unmaprole	OM
passwd	OperandPresent	OM
passwdcfg	disableadminlocko	ut OM
passwdcfg	enableadminlockou	t OM
passwdcfg	help	0
passwdcfg	set	OM
passwdcfg	setdefault	OM
passwdcfg	showall	0
userconfig	add	OM
userconfig	addad	OM
userconfig	addlf	OM
userconfig	change	OM
userconfig	delete	OM
userconfig	deletead	OM
userconfig	deletelf	OM
userconfig	showad	0
userconfig	showlf	0
userconfig	showuser	0
userrename		OM

To display the RBAC permissions for the UserManagement class:

switch:admin> classconfig --showroles UserManagement Roles that have access to the RBAC class 'usermanagement' are:

Role Name	Permission
Admin	MO
Factory	MO
Root	MO
SecurityAdmin	OM

To display the RBAC permissions for a command:

switch:admin>	classconfig	showcli classco	nfig
CLI	Option	Permission	RBA

CLI	Option	Permission	RBAC Class
classconfig	help	0	RoleConfig
classconfig	show	0	RoleConfig
classconfig	showcli	0	RoleConfig
classconfig	showroles	0	RoleConfig

SEE ALSO roleConfig

cliHistory

Displays switch command history.

SYNOPSIS

clihistory

DESCRIPTION

This command saves the following information whenever a command is executed on the switch:

- **Timestamp**
- Username
- IP address of the Telnet session
- **Options**
- Arguments

This command displays the local CLI command history. The information is saved in the SSHOW_SYS file as part of supportSave and in the CTRACE traceDump file, which is also included with the supportSave package. In addition, the CLI history is saved persistently to compact flash in the event the switch panics. The maximum number of saved entries for this command is 512.

The CLI history is erased, if the switch is rebooted or a CP failover has occurred on the active CP.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command cannot be executed on the standby CP.

OPERANDS

None

EXAMPLES

To display the command history on a switch:

```
switch:admin> clihistory
Dec 13 22:57:35.986   1 admin, 10.120.35.35, help authutil
Dec 13 23:03:18.045 1 admin, 10.120.35.35, help bannerset
Dec 13 23:10:02.842 1 admin, 10.120.35.35, help bannershow

Dec 13 23:23:23.554 1 admin, 10.120.35.35, help bcastshow
Dec 13 23:23:39.232 1 admin, 10.120.35.35, help bcastshow
```

SEE ALSO None

cmsh

Opens the CEE command shell.

SYNOPSIS cmsh

DESCRIPTION

Use this command to open a shell for managing 10 GbE interfaces and Layer2/Layer3 protocol services. The CEE management shell provides a hierarchical CLI interface.

Refer to the *CEE Command Reference* and the *CEE Administrator's Guide* for information on how to use the CEE commands and configuration procedures.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To run FCoE using the minimum switch configuration:

```
switch:admin> cmsh
admin>en
admin>#conf t
Enter configuration commands, one per line. End with CNTL/Z.

configDefault

Resets the nonpersistent configuration data to factory defaults.

SYNOPSIS

configdefault [-fid FID | -all | -switch]

DESCRIPTION

Use this command to reset the nonpersistent configuration settings to their factory default values.

Configuration data is grouped into chassis information and switch information. Each configuration type is managed separately. The behavior of **configDefault** depends on the environment in which the command is executed:

- In a Virtual Fabric environment, when executed without operands, this command resets the switch
 configuration to default values on the current logical switch only. An Admin with chassis permissions
 can use additional parameters to reset configuration data for a specified logical switch (-fid FID) or
 for all logical switches and the chassis (-all).
- In a non-Virtual Fabric environment, when executed without operands, this command resets the
 switch configuration. When executed with the -all operand, configDefault resets all of the system's
 configuration data, including chassis and switch configurations. The -switch option resets the switch
 configuration only. The -fid option is not valid.

This command resets nonpersistent configuration parameters only. The following parameters are not affected by this command:

- Ethernet MAC address, IP address, subnet mask, and boot ROM parameters
- IP gateway address
- License keys
- OEM customization
- Product ID and Vendor ID
- SNMP configuration
- System name
- Chassis name
- World wide name
- Zoning configuration (includes aliases, zones, and configurations)
- Security parameters and policies
- User account passwords (includes all user configuration and all built-in accounts)
- Switch PID format
- Ethernet Link Mode

Refer to the help files for **configure** and **configureChassis** help for more information on default values for configuration parameters.

NOTES

This command cannot be executed on an enabled switch. You must first disable the switch using **switchDisable** or chassisDisable.

Some configuration parameters are cached by the system. To avoid unexpected system behavior, reboot the system after executing **configDefault**.

Note that **configDefault** does not completely remove all FCIP tunnels and GbE IP address information. This may be an issue when attempting to use the same information to create new tunnels or modify the existing ones.

When issuing **configDefault** on the Brocade FR4-18i blade, this command persistently disables the ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-fid FID

Specifies the Fabric ID of the logical switch for which to reset the configuration. This operand is valid only in Virtual Fabric mode, and the executing account must

have chassis permissions.

-all

Restores all nonpersistent configuration parameters to factory default values (switch and chassis parameters). This command requires chassis permissions.

-switch

Resets the switch configuration only. This operand is not valid in VF mode.

EXAMPLES

To restore all system configuration parameters to default values:

```
switch:admin> configdefault -all
Executing configdefault...Please wait
Setting the default config: FID = 128 Switch Name =stinger78
Already in Native Mode continuing with configDefault
Committing configuration ... done.
The switch has to be rebooted to allow the changes to take effect.
Do you want to reboot the system (y/n) [y]: y
```

configdownload [ -vf] [-p sftp | -sftp ] ["host","user","path"]
configdownload [-vf] [-local | -USB | -U ["file"]]
```

DESCRIPTION

This command downloads configuration parameters to the local system. Two types of configuration files can be downloaded with this command: Virtual Fabric configuration parameters and system configuration parameters. You must download both types of configuration data for the system to behave as expected. You can use FTP or SCP to download configuration files from a remote host, or you can retrieve the configuration files from a predetermined directory on the local system, or from an attached USB device.

Use the **-vf** option to download the Virtual Fabric configuration parameters. The Virtual Fabric configuration file includes logical switch definitions and Virtual Fabric status (enabled or disabled). The file should be named switch-conf_xx.txt to distinguish it from the regular system configuration (config.txt). The xx indicates the platform ID. Virtual Fabric configuration data can only be shared between switches that belong to the same platform type and share the same platform ID. If the platform ID contained in the header of the configuration file does not match the platform ID of the system to which it is downloaded, **configDownload** fails. When you download a switch-conf_xx.txt file, all attributes defined in this file are downloaded to the system and take effect with the exception of LISL ports. The LISL ports on the system are not affected by this download.

The system configuration data is downloaded separately. It is grouped into chassis information and switch information. Each configuration type is managed separately and the behavior of **configDownload** depends on the environment in which the command is executed and which part of the system configuration you wish to download.

- In a Virtual Fabric environment, when executed without chassis permissions, this command downloads the switch configuration to the current logical switch only. An Admin user with chassis permissions can use additional parameters to perform the following selective configuration downloads:
 - Download the switch configuration to a specified logical switch (-fid FID).
 - Download the chassis configuration only (-chassis).
 - Download the entire configuration including the data for all logical switches and for the chassis (-all).

The interactive version of the command (no operands) prompts for input on only the parameters the user is allowed to execute.

In a non-Virtual Fabric environment, this command by default downloads the switch configuration.
 Additional options support downloading the chassis configuration (-chassis), the switch configuration (-switch) or all of the system's configuration data, including chassis and switch configurations (-all). Chassis permissions are required. The -fid option is not valid.

The switch must be disabled for configuration download of all parameters with the exception of SNMP and Fabric Watch.

The following rules apply to configuration download in Virtual Fabric mode:

- When downloading the chassis configuration, the number of logical switches defined in the configuration download must match the number of logical switches currently defined on the switch.
- When downloading the switch configuration, the target FID must be defined in both the configuration download and the current system.
- When downloading the switch configuration from a specified source FID to a target FID, the target FID must be defined on the switch and the source FID and associated configuration must be defined in the configuration download. In addition, downloading an SFID configuration resets the target FID ports without warning. Caution is advised when using this option.
- When downloading all configuration parameters, the number of switches defined in the downloaded configuration file must match the number of switches currently defined on the switch. In addition, the following restrictions apply:
 - The switches must be disabled unless you only wish to download SNMP or Fabric Watch parameters.
 - Downloading a configuration file from a system that is not Virtual Fabric-capable to a system in Virtual Fabric mode is not recommended. The configuration is applied to the default switch only, and only to the ports that are part of the default switch.
 - Downloading a Virtual Fabrics configuration file with the -vf option to a switch that has Admin Domains configured is not permitted, and the command fails with a warning message. Virtual Fabrics and Admin Domains cannot coexist on the same switch.

If an FCS policy is enabled, the following rules and restrictions apply:

- Both [Defined Security Policies] and [Active Security Policies] sections must exist and contain the FCS_POLICY.
- In the [Defined Security Policies] section, at least one member of the FCS_POLICY must be the same as a member in the previous FCS_POLICY.
- In the [Active Security Policies] section, the FCS_POLICY must be exactly the same as the previous FCS_POLICY. Order of members must be maintained.
- If either security policies section has an RSNMP_POLICY, then that section must have a WSNMP_POLICY.

- After the switch is enabled, if the switch is the primary FCS, then its security and zoning information is propagated to all other switches in the fabric.
- After the switch is enabled, if the switch is a non-FCS or a backup FCS, then its security and zoning
 information will be overwritten by the primary FCS.

Security parameters and the switch identity cannot be changed by **configDownload**. Parameters such as the switch name and IP address are ignored; they are lines in the configuration file that begin with "boot". Security parameters and version stamp are ignored; they are the lines in the configuration file that begin with "sec".

[License] is only accepted if the boot.mac parameter matches the license ID (WWN) of the switch performing the download; otherwise, it is ignored.

The configuration parameters R_A_TOV, E_D_TOV, WAN_TOV, and MAX_HOPS are interrelated. Assigning a specific value to one or more of these parameters might change the range of allowed values that can be assigned to the other parameters. As a result, you may not be able to set all the values within the range displayed for each parameter. This command validates the modified values of these four parameters and terminates the download operation, if the validation check fails.

This is particularly important when downloading a zoning configuration. Because the new zoning information is added to the current configuration, there might not be any conflicts. If the current zoning configuration is to be replaced, the keyword "clear:" should be inserted into the configuration file immediately before the zoning lines (starting at the line "[Zoning]").

If the configuration file contains the keyword "enable:" followed by a *zone_configuration*, that zoning configuration is enabled in the fabric. If there is no "enable:" keyword in the configuration file or no zoning configuration by that name exists, or if enable fails for any reason (such as dangling aliases), then the following conditions apply:

- The effective configuration remains as it was prior to the configuration download. The "enable:" action is ignored.
- The Defined Configuration changes to reflect the new zoning configuration.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

If the switch is in Access Gateway mode, some of the configuration parameters will take effect only after the switch has been re-enabled with the **switchEnable** command.

F_Port trunking configurations are not saved in the configuration file and will not be restored after a configuration download.

Do not manually edit a configuration file after uploading the file and before downloading the file to a switch. Manual editing bypasses sanity checks for some configuration parameters and results in unpredictable system behavior.

OPERANDS

This command has the following operands:

-p ftp | -ftp or -p scp | -scp or -p sftp | -sftp

Specifies the data transmission protocol as either file transfer protocol (FTP), secure copy protocol (SCP), or secure FTP (SFTP). If no protocol is specified, the protocol defaults to FTP.

-vf

Downloads the Virtual Fabric configuration (switch-conf_xx.txt) instead of the regular system configuration. The switch-con_xx.txt file contains a listing of logical switches configured on the platform specified by the platform ID (xx) and other Virtual Fabric parameters. You cannot use the **-vf** option with any of the system configuration upload options (**-fid**, **-chassis**, **-all**).

-all

Downloads all configuration data, including chassis and switch configuration data.

-fid FID

Downloads the switch configuration to a logical switch specified by its fabric ID. This operand is valid only in a Virtual Fabric environment and requires chassis permissions.

-chassis

Downloads the chassis configuration only.

-switch

Downloads the switch configuration only. This operand is valid only in non-VF mode.

"host"

Specifies the name or the IP address of the external host, from which to download the configuration. IPv4 and IPv6 addresses are supported. To be able to mention the FTP server by name, you need to set up two DNS servers with **dnsConfig**. Quotation marks are optional.

"user"

Specifies the login name for the external host. Quotation marks are optional.

"path"

Specifies the file name and path of the configuration file. Absolute path names may be specified using a forward slash (/). Relative path names search for the file in the login account's home directory on UNIX hosts and in the directory on which the FTP server is running on Windows hosts. This operand is valid only when the file is downloaded from an external host. Quotation marks are optional.

"passwd"

Specifies the account password. Quotation marks are optional.

-local

Downloads a specified configuration file from a predetermined directory on the local chassis.

-USB | -U

Downloads a specified configuration file from a predetermined directory on an attached USB device.

"file"

Specifies the name of the configuration file to be downloaded. This parameter can be used only with the **-local** or **-USB** option, each of which retrieves files from a predetermined directory on the local chassis or on an attached USB device. Therefore, subdirectories and absolute path names are not permitted. Quotation marks are optional.

-force

Overwrites an existing file without confirmation. This parameter is valid only with the **-local** or **-USB** options.

DIAGNOSTICS

The configuration download may fail for one or more of the following reasons:

- The switch has not been disabled. Disabling the switch is not necessary for configuration files
 containing only certain SNMP or Fabric Watch parameters. You can run configDownload first
 without disabling the switch, and if there is at least one changed parameter outside of Fabric Watch
 or SNMP, you are prompted to disable the switch before proceeding.
- The host name is not known to the switch.
- The host IP address cannot be contacted.
- You do not have permission on the host.
- You are running a script that prints something at login.
- The file does not exist on the host.

- The file is not a switch configuration file.
- The FTP server is not running on the host.
- The configuration file contains errors.
- The configuration file's logical switch definitions do not match the definitions on the target switch.
- Admin Domains are configured on the switch, and you attempt to download a Virtual Fabrics configuration file.

EXAMPLES

To download the switch configuration file interactively to the current logical switch from a local directory (no chassis permissions):

```
switch:admin> configdownload
Protocol (scp, ftp, sftp, local) [ftp]:
Server Name or IP Address [host]: 192.168.163.233
User Name [user]: admin
Path/Filename [<home dir>/config.txt]:
Section (all|chassis|FID# [all]):
                *** CAUTION ***
This command is used to download a backed-up configuration
for a specific switch. If using a file from a different
switch, this file's configuration settings will override
any current switch settings. Downloading a configuration
file, which was uploaded from a different type of switch,
may cause the switch to fail. A switch reboot might be
required for some parameter changes to take effect.
configDownload operation may take several minutes
to complete for large files.
Do you want to continue [y/n]: y
Password: ******
Activating configDownload: Switch is disabled
configDownload complete: All config parameters are downloaded
```

To download the switch configuration data to the current logical switch from an external FTP server (no chassis permissions):

```
switch:admin> configdownload -ftp 192.168.38.245, \
jdoe,config.txt,password
```

To download all system configuration data for the chassis and all logical switches (requires chassis permissions):

```
switch:admin> configdownload -all -ftp 192.168.38.245, \
jdoe,config.txt,password
```

To download the switch configurations to a logical switch with FID 8 from an attached USB device (requires chassis permissions):

```
switch:admin> configdownload -fid 8 -USB config.txt
```

To download the switch configurations belonging to a logical switch with FID 4 to a logical switch with FID 8 from an attached USB device (requires chassis permissions):

```
switch:admin> configdownload -fid 8 -sfid 4 \
   -USB config fid8.txt
```

To download the Virtual Fabric configuration file using secure FTP:

```
switch:admin> configdownload -vf -p sftp \
    10.32.248.119,jdoe,/temp/switch-conf_66.txt,mypassword
```

To attempt to download the Virtual Fabric configuration interactively to a switch with configured Admin

```
switch:admin> configdownload -vf -p sftp \
    10.32.248.119, jdoe, /temp/switch-conf_66.txt, mypassword
```

*** CAUTION ***

This command is used to download the VF configuration to the switch. Afterwards, the switch will be automatically rebooted and the new VF settings will be used. You will then need to run configdownload again to install the configuration(s) for any logical switch(s) that are setup in the new VF configuration.

Please note that Virtual Fabrics and Admin Domains are mutually exclusive and are not supported at the same time on a switch. If any Admin Domains are configured on the switch, the configdownload operation will fail.

Do you want to continue [y/n]: y jdoe@10.32.248.119's password:

Error: configDownload operation failed. VF/AD Conflict detected. Please remove all ADs before downloading the VF configuration to the switch.

2011/06/12-17:14:02, [CONF-1023], 3637, FID 128, INFO, sw0, configDownload failed for VF config parameters.

SEE ALSO configDefault, configList, configShow, configUpload, configure, configRemove

configList

Lists uploaded configuration files.

SYNOPSIS configlist -local | -USB | -U

DESCRIPTION This command displays a list of names, sizes, and creation dates of configuration files saved on the local

chassis or on an attached USB device. These files are created when the **configUpload** command is

executed with the -local or the -USB option.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

-local

Displays the list of configuration files on the local chassis.

-USB | -U

Displays the list of configuration files on the attached USB device.

EXAMPLES To display a list of configuration files stored on the local chassis:

 switch:admin>
 configlist
 -local

 config.txt
 25679
 2007
 Jan 02
 15:16

 config2.txt
 25679
 2007
 Jan 06
 15:16

 next_cfg.txt
 20977
 2007
 Jan 18
 15:16

SEE ALSO configDownload, configUpload, configShow, configRemove

configRemove

Deletes a saved configuration file.

SYNOPSIS configremove -local | -USB | -U [file]

DESCRIPTION This command deletes a configuration file that was previously saved to the local chassis or to an

attached USB device by using the configUpload command.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

-local

Removes a configuration file that was previously created by configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that was previously created by configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file that we can be configurated by the configuration file

from the local chassis.

-USB | -U

Removes a configuration file that was previously created by configUpload -USB

from an attached USB device.

file

Specifies the configuration file to be removed. If the file option is omitted, the

command prompts for a file name.

EXAMPLES To remove a configuration file from the local chassis:

switch:admin> configremove -local first_config.txt

To remove a configuration file from an attached USB device without specifying a filename:

switch:admin> configremove -USB File Name [config.txt]: second_config.txt

SEE ALSO configDownload, configUpload, configList, configShow

configShow

Displays system configuration settings.

SYNOPSIS configshow

configshow [-all | -fid FID | -chassis | -switch] | [-local | -USB | -U] [file] [-pattern "pattern"]

DESCRIPTION

Use this command to display system configuration settings. Some but not all of these parameters are set by the **configure** and **configureChassis** commands.

Configuration data is grouped into chassis information and switch information. Each configuration type is managed separately. The behavior of **configShow** depends on the environment in which the command is executed:

- In a Virtual Fabric environment, when executed without operands, this command displays the switch
 configuration for the current logical switch. An Admin with chassis permissions can use additional
 parameters to display configuration data for a specified logical switch (-fid FID), for the chassis
 (-chassis), or for all logical switches and the chassis (-all).
- In a non-Virtual Fabric environment, when executed without operands, this command displays the switch configuration. When executed with the -all operand, configShow displays all of the system's configuration data, including chassis and switch configuration data. The -chassis option displays the chassis configuration only. The -switch option displays the switch configuration only. The -fid option is not valid.

NOTES

Not all values displayed are applicable to all system models and configurations.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operands are optional:

-pattern "pattern"

Specifies a text string, enclosed in double quotation marks, that limits the output of the command to only those entries that contain the pattern. Use of wildcards and other common regular expression operators is not supported. Some configuration settings do not display when filtered. When in doubt, use the command without the **-pattern** operand. Executing **configShow -pattern** without further operands is not recommended and can cause unspecified behavior.

-all

Displays all configuration data including chassis and switch configuration.

-fid FID

Displays configuration data for a logical switch specified by its fabric ID. This option is valid only in a Virtual Fabric environment and requires chassis permissions

-chassis

Displays configuration data for the chassis only. This option is valid only in a Virtual Fabric environment and requires chassis permissions

-switch

Displays the switch configuration only. This option is valid only in a Non-Virtual Fabric environment.

-local [file]

Displays the content of a configuration file that was previously created by configUpload and stored on the chassis. The output can be optionally filtered by -pattern "pattern". If file is omitted, the command prompts for a file name. The output format when -local is specified matches that of configUpload and contains a superset of the information provided when -local is not specified.

-USB | -U [file]

Displays the content of a configuration file that was previously created by configUpload and stored on an attached USB device. The output can be optionally filtered by -pattern "pattern". If file is omitted, the command prompts for a file name. The output format when -USB is specified matches that of configUpload and contains a superset of the information provided when -USB is not specified.

EXAMPLES To display all configuration data on a Virtual Fabric-enabled system:

```
switch :admin> configshow -all

configUpload

Uploads system configuration data to a file.

SYNOPSIS

configupload

```
configupload [-all] [-p ftp | -ftp] ["host","user","path"
   [,"passwd"]]
configupload [-all] [-p scp | -scp] ["host","user","path"]
configupload [-all] [-p sftp | -sftp] ["host","user","path"]
configupload [-all] [-force] [-local | USB |-U] ["file"]
configupload [-fid FID | -chassis | -all | -switch]
   [-p ftp | -ftp]["host","user","path" [,"passwd"]]
configupload [-fid FID | -chassis | -all | -switch]
   [-p scp| -scp]["host","user","path"]
configupload [-fid FID | -chassis | -all | -switch]
   [-p sftp | -sftp]["host","user","path"]
configupload [-fid FID | -chassis | -all] | -switch]
   [-force] [-local | USB | -U] ["file"]
configupload [-vf] [-p ftp | -ftp] ["host","user","path"
   [,"passwd"]]
configupload [-vf] [-p scp | -scp] ["host","user","path"]
configupload [-vf] [-p sftp | -sftp] ["host","user","path"]
configupload [-vf] [-force] [-local | USB |-U] ["file"]
```

DESCRIPTION

This command uploads configuration data to a file. Two types of configuration files can be uploaded with this command: Virtual Fabric configuration parameters and system configuration parameters.

Use the **-vf** option to upload Virtual Fabric configuration parameters. The Virtual Fabric configuration includes logical switch definitions and Virtual Fabric status (enabled or disabled). The file should be named switch-conf_xx.txt to distinguish it from the regular system configuration (config.txt). The xx indicates the platform ID specified in the header of the configuration file. The platform ID is the same as the first two digits of the "switchType" parameter displayed by **switchShow**. Virtual Fabric configuration data can only be shared between switches that belong to the same platform type and share the same platform ID. Refer to **configDownload** help for more information on the Virtual Fabric configuration.

The system configuration data is uploaded separately. It is grouped into chassis information and switch information. Each configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed separately and the behavior of configuration type is managed as the confi on the environment in which the command is executed and which part of the system configuration you wish to upload.

- In a Virtual Fabric environment, when executed without chassis permissions, this command uploads the current logical switch configuration only. An Admin user with chassis permissions can use additional parameters to perform the following selective configuration uploads:
 - Upload the switch configuration of a specified logical switch (-fid FID).
 - Upload the chassis configuration only (-chassis).
 - Upload the entire system configuration including the data for all logical switches and for the chassis (-all).
 - Upload the switch configuration only in Non-VF mode(-switch).

The interactive version of the command (no operands) prompts for input on only the parameters the user is allowed to execute.

In a non-Virtual Fabric environment, this command by default uploads the switch configuration only. Additional options support uploading the chassis configuration (-chassis) or all of the system's configuration data, including chassis and switch configurations (-all). Chassis permissions are required. The -fid option is not valid.

You can use the file transfer protocol (FTP), the secure copy protocol (SCP), or secure FTP (SFTP) to upload configuration files to an external host, or you can save the configuration in a predetermined directory on the local chassis or on an attached USB device. If the specified file already exists, this command prompts you to overwrite the file. Specify **-force** to overwrite the file without confirmation. When the local chassis is chosen as the destination, the resulting file is written to both primary and secondary partitions, and on enterprise-class platforms, to both Active and Standby Control Processors (CPs).

Refer to the Fabric OS Administrator's Guide for information on backward compatibility, on configuration upload and download in Admin Domains (AD), and on the content of the configuration file.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

F_Port trunking configurations are not saved in the configuration file and will not be restored after a configuration download.

Do not manually edit a configuration or a switch-conf.xx file after uploading the file and before downloading the file to a switch. Manual editing bypasses sanity checks for some configuration parameters and results in unpredictable system behavior.

OPERANDS

This command has the following operands:

-p ftp | -ftp or -p scp | -scp or -p sftp | -sftp

Specifies the data transmission protocol as either file transfer protocol (FTP), secure copy protocol (SCP), or secure FTP (SFTP). If no protocol is specified, the protocol defaults to FTP.

-vf

Uploads the Virtual fabric configuration to a file. You must specify a filename when uploading this file. It is recommended to name this file switch-conf_xx.txt (where xx indicates the platform ID) to distinguish this file from the system configuration (config.txt). Use **switchShow** to determine the platform ID of the system. The platform ID in the header of the configuration file is the same as the first two digits of the switchType parameter in the switchShow output. You cannot use the -vf option with any of the regular configuration upload options (-fid, -chassis, -all).

-fid FID

Uploads switch configuration data from a logical switch specified by its fabric ID. This parameter is valid only in a Virtual Fabric environment and requires chassis permissions.

-chassis

Uploads chassis configuration only.

-all

Uploads all system configuration data including chassis and switch configuration for all logical switches.

-switch

Uploads the switch configuration only. This operand is not valid in VF mode.

"host"

Specifies the name or the IP address of the external host to which to upload the configuration. To be able to mention the FTP server by name, you need to set up one or more DNS servers with **dnsConfig**. Quotation marks are optional.

"user"

Specifies the login name for the external host. Quotation marks are optional.

"path"

Specifies the file name and path of the configuration file. Absolute path names may be specified using a forward slash (/). Relative path names upload the file to the login account's home directory on UNIX hosts and into the directory on which the FTP server is running on Windows hosts. This operand is valid only when the file is uploaded to an external host. Quotation marks are optional.

"passwd"

Specifies the account password. Quotation marks are optional.

-local

Uploads a specified configuration file to a predetermined directory on the local chassis. This option requires a file name.

-USB | -U

Uploads a specified configuration file to a predetermined directory on an attached USB device. This option requires a file name.

"file"

Specifies the file name. Quotation marks are optional. This parameter is valid only with the -local or -USB options, each of which stores files in a predetermined directory on the local chassis or on an attached USB device. Therefore, subdirectories and absolute path names are not permitted.

-force

Overwrites an existing file without confirmation. This parameter is valid only with the -local or -USB options.

When invoked without operands or without "host" or "file" parameters, configUpload runs in interactive mode.

DIAGNOSTICS

The configuration upload may fail for one or more of the following reasons:

- The host name is not known to the switch.
- The host IP address cannot be contacted.
- The user does not have permission on the host.
- The FTP server is not running on the host.

EXAMPLES To upload the switch configuration interactively from a switch that is not enabled for Virtual Fabrics:

```
switch:admin> configupload
Protocol (scp, ftp, sftp, local) [ftp]: sftp
Server Name or IP Address [host]: 192.168.38.245
User Name [user]: jdoe
File Name [<home dir>/config.txt]:
Section (all|chassis|switch [all]):
Password: *****
configUpload complete: All config parameters are uploaded
```

To upload the switch configuration that belongs to a logical switch with FID 100:

```
switch:admin> configupload
Protocol (scp, ftp, sftp, local) [ftp]: sftp
Server Name or IP Address [host]: 10.32.220.100
User Name [user]: jdoe
File Name [<home dir>/config.txt]: config.fid100.txt
Section (all chassis FID# [all]): 100
Password: *****
configUpload complete: All config parameters are uploaded
```

To upload the configuration for the entire chassis to a local file from the command line forcing an overwrite:

```
switch:admin> configupload -chassis -local \
     -force config.txt
configUpload complete: All config parameters are uploaded
```

To upload the configuration for the current logical switch to an external FTP server:

```
switch:admin> configupload -ftp 192.168.38.245, \
     jdoe, config.txt, password
```

To upload all system configuration data to an external FTP server:

```
switch:admin> configupload -all -ftp
     192.168.38.245, jdoe, config.txt, password
```

To upload the system configuration file for a logical switch with FID 8 to an attached USB device:

```
switch:admin> configupload -fid 8 \
     -USB config.txt
```

To upload the Virtual Fabric configuration of the current platform to an external FTP server:

```
switch:admin> configupload -vf -p ftp \
     10.32.248.119, jdoe, /temp/switch-conf.66.txt, password
```

configure

Changes switch configuration settings.

SYNOPSIS co

configure

DESCRIPTION

Use this command to change switch configuration settings.

Configuration data is grouped into chassis information and switch information. Each configuration type is managed separately. For information on file format and specific parameters contained in each section, refer to the **configUpload** help page.

The behavior of the **configure** command depends on the environment in which the command is executed:

- In a Virtual Fabric environment, the configure command sets switch configuration parameters for the current logical switch only. If a switch or chassis is configured with multiple logical switches, you must configure each logical switch separately. Use the setContext command to change the current logical switch context.
- In a non-Virtual Fabric environment, the configure command sets switch configuration parameters.

To configure chassis-wide parameters, use the **configureChassis** command.

The following switch configuration parameters can be set with the **configure** command:

- Switch fabric parameters
- Virtual channel parameters
- F_Port login parameters
- Zoning operation parameters
- Remote State Change Notifications (RSCN) transmission mode
- Arbitrated Loop parameters
- System Services settings
- Portlog Events enable or disable settings
- Secure Socket Layer (SSL) attributes
- Remote Procedure Call Daemon (RPCD) attributes
- Web Tools attributes

To access all parameters controlled by this command, you must disable the switch using the **switchDisable** command. If executed on an enabled switch, only a subset of attributes are configurable. Menu displays may vary depending on the hardware platform.

The **configure** command runs in interactive mode and presents you with a series of hierarchical menus. Each top-level menu and its associated submenus consist of a text prompt, a selection of valid values, and a default value (in brackets).

The following keys control the execution of the command:

Return

When entered at a prompt with no preceding input, the command accepts the default value (if applicable) and moves to the next prompt.

Interrupt (Ctrl-C)

Aborts the command immediately and ignores all changes made.

End-of-file (Ctrl-D)

When entered at a prompt with no preceding input, terminates the command and saves changes made.

The following parameters can be modified with the **configure** command:

Fabric Parameters

Fabric settings control the overall behavior and operation of the fabric. Some of these settings, such as the domain, are assigned automatically and may differ from one switch to another in a given fabric. Other parameters, such as buffer-to-buffer credit or timeout values, can be modified to suit specific applications or operating environments but must be in agreement among all switches to allow formation of the fabric.

The following fabric settings can be modified (* = multiplication symbol)

Type	Default	Range
Number	1	1-239
Boolean	0	0 or 1
Boolean	no	yes/no
Boolean	yes	yes/no
Boolean	no	yes/no
Number	0	0 to 2
Number	10000	E_D_TOV * 2
		to 120000
Number	2000	1000 to
		R_A_TOV/2
Number	0	0 to $R_A_{TOV}/4$
Number	7	7 to 19
Number	2112	256 to 2112
Boolean	0	0 or 1
Boolean	0	0 or 1
Boolean	0	0 or 1
Boolean	0	0 or 1
Boolean	0	0 or 1
Number	16	1 to 27
Boolean	yes	yes/no
Boolean	no	yes/no
Boolean	no	yes/no
Number	2	0-2
	Number Boolean Boolean Boolean Number Number Number Number Number Number Number Number Boolean	Number 1 Boolean 0 Boolean no Boolean no Number 0 Number 10000 Number 2000 Number 7 Number 7 Number 2112 Boolean 0 Boolean 0 Boolean 0 Boolean 0 Boolean 0 Boolean 0 Boolean 1 Boolean 0 Boolean 0 Boolean 0 Boolean 0 Boolean no Boolean no

Fabric parameters are defined as follows:

Domain

The domain number uniquely identifies a switch in a fabric. This value is automatically assigned by the fabric. The range is 1-239.

Enable 8-bit Dynamic Area Mode

When enabled, this feature supports Dynamic Area Mode in default partitions on the Brocade DCX, DCX-4S, DCX 8510-8, and DCX 8510-4. Dynamic Area Mode is disabled by default. When enabled, Dynamic Area Mode supports both static and dynamic area assignment. Use the portAddress command to perform a static assignment of an area to a given port. In Dynamic Area Mode, areas are dynamically assigned to the ports (up to a 255 limit). Port area assignments are persistent; however, disabling Dynamic Area Mode with configure resets the area assignments. This feature is configurable only on the default switch.

Enabling Dynamic Area Mode fails under one or more of the following conditions:

- The number of ports in the default partition exceeds 255.
- An AP blade with FL ports is present in the chassis (Brocade Encryption blade, or FCoE 10-24.

WWN Based persistent PID

When enabled, this feature supports both dynamic and static WWN-based PID assignment. In dynamic PID binding, the first area assigned to a device when it logs in is bound to the device WWN and remains persistent through subsequent logins. Every time the device logs into the switch, it is guaranteed to get the same PID. Alternately, you can use the **wwnAddress** command to create a static WWN-based PID assignment. In either case, the WWN-based persistent PID feature must be enabled through **configure**. The feature is disabled by default; it is dependent on Dynamic Area Mode being enabled.

Allow XISI Use

An extended interswitch link (XISL) is an interswitch link (ISL) that connects the logical switch to the base switch and carries traffic for multiple logical fabrics. This feature is supported only on Virtual Fabric-aware platforms under the following conditions: Virtual Fabrics must be enabled on the switch, and the switch cannot be a base switch. In addition, on the Brocade DCX, DCX-4S, DCX 8510-8, and DCX 8510-4 the switch cannot be a default switch or include interchassis link (ICL) ports. This feature is enabled by default (yes=enabled). On the Brocade 5100, 5300, VA-40FC, and 6510 default switch, the feature is disabled by default (no=disabled). Beginning with Fabric OS v7.0.0, the XISL feature is supported on the Brocade extension blade (FX8-24).

You do not need to disable the logical switch before changing the value of this parameter. Turning off XISL use requires confirmation because all LISLs will be removed upon execution. If the logical switch is enabled and is part of an edge fabric connected to an FCR, this parameter cannot be turned on. If the logical switch is disabled or it is not yet part of an edge fabric, this parameter can be turned on. However, execution may cause edge fabric segmentation if the EX_Port connected to the edge fabric is disabled while the logical switch is enabled or connected to the edge fabric.

Disable FID Check

If fabric ID (FID) check is disabled, the fabric ignores the Fabric Identifier conflict with the neighboring switch during fabric formation. By default, FID check is enabled. If the fabric detects a FID conflict, it disables the E_Port with a "Fabric ID conflict" message. This parameter is configurable only if the switch is Virtual Fabric-aware and Virtual Fabric is enabled on the switch.

Enable 256 Area limit

The 256 area limit allows the partition to be configured for 8-bit addressing rather than the default 10-bit addressing. Each port in this partition is given a unique area represented by the middle 8 bits of the PID. Valid values include the following:

0

No limit is imposed on the area. This is the default value. The partition is configured for 10-bit addressing and supports up to 1800 ports.

1

The unique area assignments begin at zero regardless of where the port is physically located. This allows FICON users to make use of high port count port blades with port indexes greater than 256. However, this mode is not compatible with domain-index zoning.

2

The unique area assignments are based on the port index. This mode does not allow FICON users to make use of ports with an index greater than 256 (high ports of a high port count blade), but this mode is compatible with domain-index zoning. This parameter is configurable only if the switch is Virtual Fabric-aware and Virtual Fabric is enabled on the switch.

R_A_TOV

The resource allocation time out value specified in milliseconds. This variable works with the variable E_D_TOV to determine switch actions when presented with an error condition.

Allocated circuit resources with detected errors are not released until the time value has expired. If the condition is resolved prior to the time out, the internal time-out clock resets and waits for the next error condition.

E_D_TOV

Error detect time out value specified in milliseconds. This timer is used to flag a potential error condition when an expected response is not received within the set time limit. If the time for an expected response exceeds the set value, then an error condition occurs.

WAN_TOV

Wide area network time out value specified in milliseconds. This timer is the maximum frame time out value for a WAN, if any, interconnecting the Fibre Channel islands.

MAX HOPS

Maximum hops is an integer that denotes the upper limit on the number of hops a frame might have to traverse to reach any destination port from any source port across the fabric.

Note that the R_A_TOV, E_D_TOV, WAN_TOV, and MAX_HOPS configuration parameters are interrelated. Assigning a specific value to one or more of these parameters can change the range of allowed values that can be assigned to the other parameters. As a result, you may not be able to set all the values within the range displayed against each parameter. To reduce problems, the configuration utility validates the modified parameter values and prompts you to re-enter some values. If the validation check fails.

Data Field Size

The data field size specifies the largest possible value, in bytes, for the size of a type 1 (data) frame. The switch advertises this value to other switches in the fabric during construction of the fabric as well as to other devices when they connect to the fabric. Setting this parameter to a value smaller than 2112 might result in decreased performance.

Sequence-Level Switching

When sequence-level switching is set to 1, frames of the same sequence from a particular source are transmitted as a group. When this feature is set to 0, frames are transmitted interleaved among multiple sequences.

Under normal conditions, sequence-level switching should be disabled for better performance. However, some host adapters have performance issues when receiving interleaved frames from multiple sequences. When there are such devices attached to the fabric, sequence-level switching should be enabled.

Disable Device Probing

When disable device probing is set to 1, devices that do not register with the Name Server will not be present in the Name Server data base. Set this mode only if the switch's N_Port discovery process (PLOGI, PRLI, INQUIRY) causes an attached device to fail.

Suppress Class F Traffic

By default, the switch can send Class F frames. When this option is turned on, Class F traffic is converted to Class 2 traffic before being transmitted.

Per-frame Route Priority

In addition to the eight virtual channels used in frame routing priority, support is also available for per-frame-based prioritization when this value is set. When Per-frame Route Priority is set to 1, the virtual channel ID is used in conjunction with a frame header to form the final virtual channel ID.

Long Distance Fabric

When this mode is set to 1, ISLs in a fabric can be up to 100 km long. The exact distance level is determined by the per-port configuration on the E_Ports of each ISL. Both E_Ports in an ISL must be configured to run the same long-distance level; otherwise, the fabric will be segmented.

An Extended Fabrics license is required to set this mode.

BB Credit

The buffer-to-buffer (BB) credit represents the number of buffers available to attached devices for frame receipt. The range of allowed values varies depending on other system settings (see Unicast-only Operation). Refer to the *Fabric OS Administrator's Guide* for more information on platform-specific BB Credit limitations.

Insistent Domain ID Mode

When this mode is set, the switch attempts to acquire from the fabric the domain number programmed in its "Switch Fabric Settings." If the operation fails, the switch will segment from the fabric. There is no longer a need to disable the switch before configuring this parameter.

Disable Default PortName

When this mode is set, the switch does not generate a default port name.

Edge hold time

Configures the maximum time a frame can wait after it is received on the ingress port and before it is delivered to the egress port. If the frame waits in the egress buffer for more than the configured hold time, the switch drops the frame, replenishes sender's credit, and increments the counters sts_tx_timeout and er_c3_timeout on the TX and RX ports respectively. The frame-timeout indicates a slow draining or a congestion or bottleneck in the fabric. Decreasing hold time on the edge switches may reduce frame drop counts in the core switches. This parameter is stored persistently in the configuration file. You can configure Edge hold time only on the default switch.

The edge hold time parameter is enabled by default with a value of 1 (220 milliseconds).

0

Low edge hold time (80 milliseconds).

1

Medium edge hold time (220 milliseconds). This is the default value.

2

High edge hold time (500 milliseconds).

Virtual Channel Settings

VC Priority specifies the class of frame traffic given priority for a virtual channel. The switch enables fine-tuning for a specific application by configuring the parameters for eight virtual channels. The first two virtual channels are reserved for switch internal functions and are not available for modification.

The default virtual channel settings have already been optimized for switch performance. Changing the default values can improve switch performance but can also degrade performance. Do not change these settings without fully understanding the effects of the changes.

The values for virtual channel settings are as follows:

Field	Default	Range
VC Priority 2	2	2 to 3
VC Priority 3	2	2 to 3
VC Priority 4	2	2 to 3
VC Priority 5	2	2 to 3
VC Priority 6	3	2 to 3
VC Priority 7	3	2 to 3

F_Port Login Parameters

Specifies the F_Port login parameters. The following F_Port login settings are configurable. Unless there are issues with F_Port staging, do not change default values. (* = multiplication symbol)

Field	Type	Default	Range
Maximum logins per switch	Number	For directors: 16 * the max number of physical ports	1 to 126 * the max
Logins per second Login stage interval	Number	0	0 to 100
(milli-seconds) Stage FDISC logins	Number	0	0 to 10000
with busy rejects: Enforce FLOGI/FDISC	Number	0	1 to 255
login:	Number	0	0 to 1

Maximum logins per switch

Sets a switch-wide limit on allowed logins. The maximum login per switch has decreased with Fabric OS v6.4.0. When upgrading from pre-v6.4.0 firmware versions, the configured maximum is carried forward and may exceed the v6.4.0 limit. It is recommended to reconfigure this parameter to be within the range permitted in Fabric OS v6.4.0.

The following three parameters are related to staged F_Port logins by FLOGI requests and virtual device logins by FDISC(SID==0) requests.

Logins per second

Specifies the number of logins the switch accepts per second in staged F_Port bring up.

Login stage interval

Specifies the stage interval in staged F_Port bring up.

Stage FDISC logins with busy reject:

This parameter, if nonzero, enables staging of FDISC logins by rejecting the FDISC requests with "logical busy", when the requests are more than the number of configured "logins per second". It also specifies the number of FDISC requests that will always be accepted first without reject.

Enforce FLOGI/FDISC login

Setting this flag allows a second F_Port login (FLOGI/FDISC login) in the event of two devices attempting to log in with the same PWWN. In default mode (zero) the first FLOGI/FDISC login takes precedence over the second. When the flag is set to 1, the second LOGI/FDISC login takes precedence over the first. This parameter applies only to NPIV ports. You must disable the switch to change this parameter.

Zoning Operation Parameters

The following zoning operation parameter can be modified.

Disable NodeName Zone Checking

Specify 1 to disable using node WWN when specifying nodes in the zone database. Specify 0 to enable using node WWN when specifying nodes in the zone data. The default value is 0. This value must be set to 1 for interpretability.

RSCN Transmission Mode

The RSCN transmission modes and values are as follows:

End-device RSCN Transmission Mode

Values are as follows:

0

RSCN only contains single PID

1

RSCN contains multiple PIDs (Default)

2

Fabric addresses RSCN

Domain RSCN to End-device

Values are as follows:

0

Disabled. No domain RSCN is sent to the end-device for the switch IP address or name change.

1

Enabled. Domain RSCN is sent to the end-device for the switch IP address or name change.

Arbitrated Loop Parameters

Arbitrated Loop Parameter and their values are as follows:

Send FAN frames?

Specifies that fabric address notification (FAN) frames be sent to public loop devices to notify them of their node ID and address. When set to 1, frames are sent; when set to 0, frames are not sent. The default value is 1.

Enable CLOSE on OPEN received?

If this is set, a CLS is returned immediately to an OPN if no buffers are available. This is required for TachLite. The valid range is 0 to 4. The default value is 0.

Always send RSCN?

Following the completion of loop initialization, a remote state change notification (RSCN) is issued when FL_Ports detect the presence of new devices or the absence of preexisting devices. When set to 1, an RSCN is issued upon completion of loop initialization, regardless of the presence or absence of new or preexisting devices. When set to 0, an RSCN is not sent (default).

System Services Settings

The values for the System Services settings are as follows:

Disable RLS probing

Enables or disables the read link status (RLS) probing. Performed by the FCP daemon, RLS probing reads the link error block from the device. This extended link services command is defined by the FC standards. Refer to the FC standards for information. RLS probing is enabled by default, meaning "Disable RLS probing" is "off". "on" disables RLS probing.

Portlog Events Enable/Disable Settings

These settings determine whether or not various types of port events are logged.

Each event type displayed on the screen is enabled by default ("on"). When disabled, this event is not logged by the port log.

Application Attributes

A number of application attributes are configurable. The following table specifies the attributes for applications that can be modified.

Application	Field	Type	Default	Range
ssl				
	Certificate File CA Certificate File Length of crypto key	string string number	<pre>[not-set] [not-set] [128]</pre>	
rpcd				
Webtools	Secure RPCd Callback Secret	string	none	varies
	Basic User Enabled Perform License	boolean	no	no/yes
	Checking and Warning Allow Fabric Event	boolean	yes	yes/no
	Collection Login Session Timeout (in seconds)	boolean number	yes 200	yes/no 60 to 432000

NOTES

The maximum per port login limit is no longer configurable with this command. Use the portcfgNPIVPort --setloginlimit command to configure this parameter on a per port basis.

The Telnet interface is no longer configurable with this command. Use the ipFilter command to enable or disable the Telnet interface.

The SNMP attributes are no longer configurable with this command. Use the snmpConfig --set seclevel command to configure SNMP attributes.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To enable XISL use on a logical switch with FID 20:

```
switch:admin> setcontext 20
switch:admin> switchdisable
switch:admin> configure
Configure...
 Fabric parameters (yes, y, no, n): [no] y
    Domain: (1..239) [1]
    Enable a 256 Area Limit
      (0 = No,
      1 = Zero Based Area Assignment,
      2 = Port Based Area Assignment): (0..2) [0] 1
    WWN Based persistent PID (yes, y, no, n): [no]
Allow XISL Use (yes, y, no, n): [yes]yes
```

```
R_A_TOV: (4000..120000) [10000]
E_D_TOV: (1000.. 5000) [2000]
WAN_TOV: (0..30000) [0]
MAX_HOPS: (7..19) [7]
Data field size: (256..2112) [2112]
Sequence Level Switching: (0..1) [0]
Disable Device Probing: (0..1) [0]
Suppress Class F Traffic: (0..1) [0]
Per-frame Route Priority: (0..1) [0]
Long Distance Fabric: (0..1) [0]
BB credit: (1..27) [16]
Disable FID Check (yes, y, no, n): [no]
Insistent Domain ID Mode (yes, y, no, n): [no]
Disable Default PortName (yes, y, no, n): [no]
Edge Hold Time(0 = Low(80ms), 1 = Medium(220ms),
      2 = High(500ms): [220ms]): (0..2) [1]
Virtual Channel parameters (yes, y, no, n): [no]

configureChassis

Changes chassis-level system configuration settings.

SYNOPSIS configurechassis

DESCRIPTION

Use this command to modify chassis-level system configuration settings.

Configuration data is grouped into chassis information and switch information. Each configuration type is managed separately.

Use the **configure** command to modify switch configuration parameters. Use the **configureChassis** command to modify the following chassis configuration parameters:

- Cfgload attributes
- Custom Attributes
- System settings

This command requires chassis permissions in both Virtual Fabric and non-Virtual Fabric environments.

The **configureChassis** command interactively presents a hierarchical menu. Each top-level heading and its associated subheadings consist of a text prompt, a selection of valid values, and a default value (in brackets).

The following keys control the execution of the command:

Return

When entered at a prompt with no preceding input, the command accepts the default value (if applicable) and moves to the next prompt.

Interrupt (Ctrl-C)

Aborts the command immediately and ignores all changes made.

End-of-file (Ctrl-D)

When entered at a prompt with no preceding input, terminates the command and saves changes made.

The following parameters can be modified with the configureChassis command:

Cfgload Attributes

Configures configuration upload and download parameters.

Enforce secure Config Upload/Download

Enables (yes) or disables (no) secure configuration upload or download. The default value is "no.

Enforce signature validation for firmware

Enables (yes) or disables (no) signature validation enforcement. By default, this feature is disabled (no).

Add Suffix to the uploaded file name

Appends a suffix to the uploaded configuration file. The suffix includes the chassis name and a time stamp in the *yyymmdd_hhmmss* format. Refer to the example section for an illustration. This feature is disabled by default.

Custom Attributes

The following custom attributes can be modified.

config Index

OEM custom configuration. The range is 0 through 10000. The default is 0. This attribute is for internal use only.

System attributes

The following system-related parameters are configurable on a Virtual Fabric-aware switch.

system.blade.bladeFaultOnHwErrMsk

If this field is set to a value other than 0, then any nonfatal HW ASIC data parity error causes the problem blade to be powered off. The valid range is 0x0 to 0xffff. The default value is 0x0.

system.cpuLoad

Sets a threshold to define internally when the CPU is busy. The default threshold is 121, which represents a CPU instantaneous load average of 1.21 in the or top command. The range is 10 to 121 (representing CPU load thresholds of .10 to 1.21).

system.i2cTurboCnfg

Configures the i2c driver that manages processing of the i2c interrupts. The I2C Turbo mode is enabled (Setting 1) by default on all 16G platforms running Fabric OS v7.0 or later. The mode is disabled by default for any switches capable of running Fabric OS v6.4x and Fabric OS v6.3x. An upgrade preserves the pre-upgrade configuration. The value shown in brackets is the current value. The following values are supported:

0

Disables the I2C Turbo mode. When the I2C Turbo mode is disabled, every byte received by an i2c interrupt is scheduled for processing by the given task or process. This permits other high priority processes to complete, thereby allowing for possible delay in the receipt of the I2C response message.

1

Enables the I2C Turbo mode for SFP transceivers only. This is the default setting. When the I2C Turbo mode is enabled, every I2C byte received from an SFP transceiver is processed by the interrupt handler itself, thus preventing any higher priority processes from preempting this processing.

2

For internal use only.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To enable signature validation for downloading firmware:

```
switch:admin> configurechassis

Configure...

cfgload attributes (yes, y, no, n): [no] y

Enforce secure config Upload/Download (yes, y, no, n): [no]
   Enforce signature validation for firmware (yes, y, no, n): [no]y
   Add Suffix to the uploaded file name (yes, y, no, n): [no]

Custom attributes (yes, y, no, n): [no]
system attributes (yes, y, no, n): [no]
```

To add a suffix to the uploaded file name:

```
switch:admin> configurechassis

Configure...

cfgload attributes (yes, y, no, n): [no] y

Enforce secure config Upload/Download (yes, y, no, n): [no]
   Enforce signature validation for firmware (yes, y, no, n): [no]
   Add Suffix to the uploaded file name (yes, y, no, n): [no] y

Custom attributes (yes, y, no, n): [no]
system attributes (yes, y, no, n): [no]
```

To upload and list the configuration file locally:

```
switch:admin> configupload
  configupload
Protocol (scp, sftp, local) [scp]:
Server Name or IP Address [host]: 10.70.212.152
User Name [user]: admin
Path/Filename [<home dir>/config.txt]:
Section (all|chassis|FID# [all]):
Password: *****

configUpload complete: All selected config parameters are uploaded
admin@hq1:ls /temp/config
config.txt_Brocade5100_20110220_151606
admin@hq1: date
Sun Feb 20 15:17:14 UTC 2011
```

cryptoCfg

Performs encryption configuration and management functions.

SYNOPSIS

cryptocfg --help -nodecfg

cryptocfg --help -groupcfg

cryptocfg --help -hacluster

cryptocfg --help -devicecfg

cryptocfg --help -transcfg

cryptocfg --help -decommission

DESCRIPTION

Use the cryptoCfg command to configure and manage the Brocade Encryption Switch and the FS8-18 encryption blade. These platforms support the encryption of data-at-rest for tape devices and disk array logical unit numbers (LUNs).

The **cryptoCfg** CLI consists of eight command sets grouped around the following configuration functions:

- 1. Node configuration
- 2. Encryption group configuration
- 3. High Availability (HA) cluster configuration
- 4. Storage device configuration and management
- Transaction management
- Device decommissioning

Each of these command groups is documented in a separate section that includes function, synopsis, description, and operands. Examples are presented at the end of the help page.

For detailed encryption switch management and configuration procedures, refer to the Fabric OS Encryption Administrator's Guide.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

CAUTION: When configuring a LUN with multiple paths, there is a considerable risk of ending up with potentially catastrophic scenarios where different policies exist for each path of the LUN, or a situation where one path ends up being exposed through the encryption switch and other path has direct access to the device from a host outside the secured realm of the encryption platform. To protect against this risk, it is necessary to configure containers IN SEQUENCE and with the same policies and not issue a commit until the configuration for all hosts accessing the LUN is complete. Failure to follow correct configuration procedures for multi-path LUNs results in data corruption. If you are configuring multi-path LUNs as part of an HA cluster or DEK cluster or as a standalone LUN accessed by multiple hosts, follow the instructions described in the section "Configuring a multi-path Crypto LUN" in the Fabric OS Encryption Administrator's Guide.

FUNCTION

1. Node configuration

SYNOPSIS

cryptocfg --help -nodecfg

```
cryptocfg --initnode
cryptocfg --initEE [slot]
cryptocfg --regEE [s/of]
cryptocfg --enableEE [slot]
cryptocfg --disableEE [slot]
cryptocfg --export -scp -dhchallenge vault_IP_address |
   -currentMK | -KACcert | -KACcsr | -CPcert
   host_IP host_username host_file_path
cryptocfg --export -usb -dhchallenge vault_IP_address |
   -currentMK | -KACcert | -KACcsr | -CPcert dest_filename
cryptocfg --import -scp local_name host_IP host_username
   host_file_path
cryptocfg --import -usb dest_filename source_filename
cryptocfg --reg -membernode member_node_WWN
   member_node_certfile Member_node_IP_addr
cryptocfg --dereg -membernode member_node_WWN
cryptocfg --dhchallenge vault_IP_addr
cryptocfg --dhresponse vault_IP_addr
cryptocfg --zeroizeEE [slot]
cryptocfg --delete -file local_name
cryptocfg --reg -KAClogin primary | secondary
cryptocfg --show -file -all
cryptocfg --show -localEE
cryptocfg --rebalance [slot]
cryptocfg --kvdiag [-enable | -disable | -show]
   [-interval interval] [-type type]
```

DESCRIPTION

Use the node configuration commands to perform node initialization and configuration tasks. Node initialization and configuration must be performed on every node. A node is an encryption switch or a chassis containing one or more encryption blades. A node is identified by the switch IP address or switch WWN, which is subsequently referred to as the "node WWN." The node configuration commands include the following functions:

- Node initialization and certificate generation.
- Certificate export and import to and from a specified host or USB device.
- Enabling or disabling an encryption engine (EE).
- Encryption group member node and group leader registration.

- Group-wide policy configuration.
- Zeroization of all critical security parameters on the local encryption switch or blade.
- Certificate display and management.
- Display of the local encryption engine status.
- Rebalancing of disk and tape LUNS for optimized performance.
- Configuring and running key vault diagnostics.

Use the --show -localEE command to display encryption engine configuration parameters pertaining to the local node. The command displays the following information:

- EE Slot: Encryption engine slot number.
- SP state: Security processor state. For a complete listing of SP states, refer to the Fabric OS Encryption Administrator's Guide, Appendix A.
- Current master key ID (or primary link key ID) Key ID or zero if not configured.
- Alternate master key ID (or secondary link key- Key ID or zero if not configured.
- HA cluster name to which this EE belongs, or "No HA cluster membership".
- EE Attributes: The following attributes are displayed:
 - Link IP Address: Link IP address
 - Link GW IP Address: Link gateway W IP address
 - Link Net Mask: Link net mask
 - Link MAC Address: Link MAC address
 - Link MTU: The maximum transmission unit of the link
 - Link State: DOWN unless the EE is part of an HA cluster
 - Route Mode: Always "shared;" this parameter is not configurable
 - Media Type: TAPE, DISK, DISK/TAPE, or NOT DEFINED
 - Rebalance Recommended: No, Yes, or EE Busy (unspecified, try again to determine rebalance recommendation)
 - System Card Label: Displayed only if a system card is registered
 - System Card CID: Displayed only if a system card is registered.

Remote EE Reachability: If the EE is part of an encryption group, the following information is displayed for the peer. Node WWN/Slot, EE IP Address, EE State, and IO Link State. On a chassis with multiple encryption blades, remote reachability information is displayed for all encryption groups.

NOTES

The initial setup includes preparatory steps that are outside the scope of the cryptoCfg command. For preinitialization procedures, refer to the Fabric OS Encryption Administrator's Guide.

OPERANDS

The **cryptoCfg** node initialization and configuration function has the following operands:

--help -nodecfg

Displays the synopsis for the node initialization and configuration function. This command is valid on all nodes.

--initnode

Initializes the node to prepare for the configuration of encryption options. Initialization must be performed on every node before configuration options may be set and encryption may be enabled.

This command prompts for confirmation, because the **--initnode** function overwrites any previously generated identification or authentication data on the node. Successful execution generates the node CP certificate, the key authentication center (KAC) certificate, the FIPS Crypto Officer, and the FIPS User key pairs.

Some of the certificates generated with this command may need to be exported so that they can be registered with external entities, such as the key vault or the group leader, for mutual authentication. Refer to the *Fabric OS Encryption Administrator's Guide* for details.

The **--initnode** function must be performed before the **--initEE** function may be performed.

--initEE

Initializes the encryption engine (EE). This command generates critical security parameters (CSPs) and certificates in the CryptoModule's security processor (SP). The CP and the SP perform a certificate exchange to register respective authorization data. Initialization must be performed on every encryption engine before configuration options may be set and encryption may be enabled.

This command prompts for confirmation, because it overwrites any previously generated identification or authentication data on the SP. Existing key encryption keys (KEKs) such as link keys or master keys are erased. If this is not a first-time initialization, make sure to export the master key before running this command. If the encryption engine was configured with an LKM key vault, you will have to reconfigure the key vault to regenerate the Trusted Link after initializing the encryption engine.

The **--initnode** function must be performed before the **--initEE** function may be performed.

slot

Specifies the slot number of the encryption engine to be initialized. This operand is required on bladed systems.

--regEE

Registers a previously initialized encryption engine with the CP or chassis. The CP and the specified encryption engine perform a certificate exchange to register respective authorization lists across the encryption engine's FIPS boundary. The encryption blade's certificate is registered with the CP. The CP, FIPS Crypto Officer, and FIPS User certificate are registered with the specified encryption engine.

slot

Specifies the slot number of the encryption engine to be registered. This operand is required on bladed systems.

--enableEE | --disableEE

Enables or disables an encryption engine to perform encryption. You must create the encryption group and complete the key vault registration before you can enable an encryption engine for encryption. In addition, you must re-enable the encryption engine for encryption every time a Brocade Encryption Switch or DCX chassis goes through a power cycle event or after issuing **slotPowerOff** followed by **slotPowerOn** for an FS8-18 blade. This command is valid on all nodes.

slot

Specifies the slot number to identify the encryption engine. This operand is required on bladed systems.

--export

Exports a certificate from the local encryption switch or blade to a specified external host or to a mounted USB device. This command is valid on all nodes. The files are exported from the predetermined directory that was generated during the node initialization phase. The following operands are supported with the --export command:

-scp

Exports a specified certificate to an external host using the secure copy (SCP) protocol.

When **-scp** is specified, the following operands are required:

host IP host_name

Specifies the IP address of the host to which the file is to be exported. To specify the host by name, it must first be configured with the **dnsConfig** command.

host_username

Specifies the user name for the host. Depending on your host configuration, the command may prompt for a password.

host_file_path

Specifies the fully qualified path to the file on the host to which the file is to be exported. This includes the file name. Make sure to name your certificates so you can track the file type and the originator switch, for example, name cpcert.pem.

-usb

Exports a specified certificate to a mounted USB storage device. When **-usb** is specified, the following operands are required:

dest_filename

Specifies the name of the file on the USB device to which the file is to be exported. The file is stored in a predetermined default directory on the storage device.

Specify one of the following certificates to be exported. Certificates must be specified by file type. Referring to certificates by file name is not permitted. These file types are valid both with the **-scp** and with the **-usb** options.

-dhchallenge vault_IP_address

Exports the DH Challenge file for the specified key vault.

-currentMK

Exports the current master key file.

-KACcert

Exports the KAC certificate.

-KACcsr

Exports the certificate sign request file. Use the cryptocfg --reg -KACcert command to register the certificate on the node after it has been signed and reimported. This procedure must be performed for allnodes that participate in a two-way certificate exchange-based authentication mechanism with key vaults. Two-way certificate exchange is supported only for the RKM, HP SKM, and TEMS key vaults.

-CPcert

Exports the member node CP certificate.

--import

Imports a certificate from a specified external host or from a mounted USB storage device to a predetermined directory on the local encryption switch or blade. This command is valid on all nodes.

Files to be imported include member node CP certificates and key vault certificates. Use the **cryptocfg --show -file -all** command to view all imported files. The following operands are supported with the **--import**command:

-scp

Imports a specified certificate from an external host using the secure copy (SCP) protocol. When **-scp** is specified, the following operands are required:

local_name

Specifies the name to be assigned to the imported certificate. This is a user-generated file name.

host_IP | host_name

Specifies the IP address or name of the host from which to import the file. To specify the host by name, it must first be configured with the **dnscCnfig** command.

host username

Specifies the user name for the host. Depending on your host configuration, this command may prompt for a password.

host_file_path

Specifies the fully qualified path of the file to be imported. The path must include the file name.

-usb

Imports a file from a mounted USB storage device. This command is valid only on nodes with an attached USB device. When **-usb** is specified, the following operands are required:

dest_filename

Specifies the name to be assigned to the imported file. This is a user-generated file name.

source_filename

Specifies the name of the certificate on the USB storage device from which you are importing.

--reg -membernode

Registers a member node with the group leader. This command is valid only on the group leader. The encryption group must have been created prior to performing member node registration. All member nodes and group leaders must be registered before encryption group discovery and formation can occur.

The order in which member node registration is performed defines group leader succession. At any given time, there is only one active group leader in an encryption group. The group leader succession list Specifies the order in which group leadership is assumed if the current group leader is not available.

The following operands are required when registering a member node with the group leader:

member_node_WWN

Specifies the switch world wide name of the member node.

member_node_certfile

Specifies the member node CP certificate. You must have exported this file earlier to external storage and then imported it to the group leader before you can register a member node. Use the **cryptocfg --show -file -all** command to view all imported certificates.

member_node_IP_add

Specifies the IP address of the member node to be registered with the group leader.

--dereg -membernode

Removes the registration for the specified member node. This command is valid only on the group leader. The node is identified by the switch WWN.

member_node_WWN

Specifies the member node by its switch WWN. This operand is required when removing a node registration.

--dhchallenge

Establishes a link key agreement protocol between a node and an instance of the primary or backup NetApp Lifetime Key Management (LKM) appliance. This command generates the Diffie-Hellman challenge that is passed from the node to the specified NetApp LKM appliance. When quorum authentication is enabled and the quorum size is greater than zero, this operation requires authentication of a quorum of authentication cards. This command is valid on all nodes.

vault_IP_addr

Specifies the IP address of the NetApp LKM appliance. This operand is required.

--dhresponse

Accepts the LKM Diffie-Hellman response from the specified NetApp LKM appliance and generates the link key on the node on which this command is issued. The DH response occurs by an automatic trusted link establishment method. The LKM appliance must be specified by its vault IP addr. The DH challenge request must be approved on the Net App LKM appliance for this command to succeed. When quorum authentication is enabled (Quorum Size is > 0), this operation requires authentication of a quorum of authentication cards.

vault_IP_addr

Specifies the IP address of the NetApp LKM appliance. This operand is required.

--zeroizeEE

Zeroizes all critical security parameters on the local encryption switch or blade including all data encryption keys. This command is valid on all nodes. This operation causes the encryption switch to reboot. When issued on a chassis, it power-cycles the encryption blade only. This command prompts for confirmation and should be exercised with caution.

slot

Specifies the slot number of the encryption engine to be zeroized on a bladed system.

--delete -file

Deletes an imported file. The file must be specified by its local name. This command is valid on all nodes.

local_name

Specifies the file to be deleted from the local directory where certificates are stored.

--reg -KAClogin

Registers the node KAC login credentials (username and password) with the configured key vaults. This command is valid for the Thales nCipher (TEMS), HP SKM, and the TKLM key vaults. This command must be run on each member node.

primary | secondary

Specifies the key vault as primary or secondary.

For the TEMS, run this command on both a primary and a secondary key vault. The system generates a username based on the switch WWN. The username and group under which the username should be created on the key vault are displayed when the command is executed. Configure the password on the switch and create the same username on the key vault.

For the SKM, run this command only for the primary key vault. The login credential must match a valid username/password pair configured on the key vault. The same username/password must be configured on all the nodes of any given encryption group to prevent livity issues between the SKM and the switch. However, there is no enforcement from the switch to ensure the same username is configured on all nodes. Different encryption groups can use different usernames so long as all nodes in the group have the same username. Changing the username using -KAClogin renders the previously created keys inaccessible. When changing the username you must do the same on the key vault, and you must change the key owner for all keys of all LUNs through the SKM GUI. For downgrade considerations, refer to the Fabric OS Encryption Administrator's Guide.

--show

Displays node configuration information. This command requires one of the following mutually exclusive operands:

-localEE

Displays encryption engine information local to the node.

-file -all

Displays all imported certificates. The **-all** parameter is required with the **--show -file** command.

--rebalance [slot]

Rebalances the disk and tape containers to maximize throughput. Rebalancing is recommended after containers have been added, removed, moved, failed over, and failed back. This is a disruptive operation. You may have to restart backup applications after rebalancing is complete. Optionally specify a slot number on bladed systems.

--kvdiag -enable

Enables the keyvault diagnostics. When enabled, this command checks connectivity, configuration parameter retrieval, and readiness for key retrieval and archival at specified intervals. You can configure the tests to run separately for each encryption node. The actions of this command are diagnostic only; no corrective measures are taken. Key vault connectivity errors are reported through RASlog messages. Logs are stored in /etc/fabos/mace/kvdiag.log. The key vault diagnostics is by default enabled.

--kvdiag -disable

Disables the key vault diagnostics.

--kvdiag -show

Displays the current configuration of the key vault diagnostics, including the enabled status, configured time interval, and test types.

--kvdiag -interval interval

Specifies the time interval at which the test is repeated (in minutes). Valid values are 1 through 2147483647. The default value is 5 minutes. This operand is valid only if key vault diagnostics is enabled.

--kvdiag -type type

Specifies the type of key vault test. Valid test types include the following:

connect

Monitors key vault connectivity. Disconnect and reconnect events generate a RASlog message.

config

Retrieves configuration parameters from the key vault.

diag

Runs diagnostic tests including retrieval, archival and synchronization of the tests in the key vault cluster.

EXAMPLES

To initialize a node and generate certificates (output shows what is generated and where it is stored):

```
SecurityAdmin:switch> cryptocfg --initnode
This will overwrite all identification and authentication data
ARE YOU SURE (yes, y, no, n): [no] y
Notify SPM of Node Cfg
Operation succeeded.
```

To initialize an encryption engine:

```
SecurityAdmin:switch> cryptocfg --initEE
This will overwrite previously generated identification
and authentication data
ARE YOU SURE (yes, y, no, n): y
Operation succeeded.
```

To register an encryption engine with the CP or chassis:

```
SecurityAdmin:switch> cryptocfg -regEE
Operation succeeded.
```

To enable an encryption engine:

```
SecurityAdmin:switch> cryptocfg --enableEE
Operation succeeded.
```

To disable an encryption engine:

```
SecurityAdmin:switch> cryptocfg --disableEE
Operation succeeded.
```

To export a KAC certificate from the group leader to an external host:

```
SecurityAdmin:switch> cryptocfg --export -scp -KACcert \
   192.168.38.245 mylogin kac_lkm_cert.pem
Password: *****
Operation succeeded.
```

To export a KAC certificate from the group leader to an attached USB device:

```
SecurityAdmin:switch> cryptocfg --export -usb \
   -KACcert kac_lkm_cert.pem
Password:*****
Operation succeeded.
```

To import a member CP certificate to the group leader:

```
SecurityAdmin:switch> cryptocfg --import \
    -scp enc1_cpcert.pem 192.168.38.245 mylogin \
   /temp/certs/enc_switch1_cpcert.pem
Password:
```

To register a member node with the group leader:

```
SecurityAdmin:switch> cryptocfg --reg \
    -membernode 10:00:00:05:1e:39:14:00 \
    enc_switch1_cert.pem 10.32.244.60
Operation succeeded.
```

To deregister a member node:

```
SecurityAdmin:switch> cryptocfg --dereg \
-membernode 10:00:00:05:1e:53:b6:80
Operation succeeded.
```

To generate a trusted link establishment package (TEP):

```
SecurityAdmin:switch> cryptocfg --dhchallenge 10.33.54.231 Operation succeeded.
```

To issue the DH response to retrieve the TAP from the NetApp LKM appliance:

```
SecurityAdmin:switch> cryptocfg --dhresponse 10.33.54.231 Operation succeeded.
```

To zeroize all critical security parameters on an encryption switch:

```
SecurityAdmin:switch> cryptocfg --zeroizeEE
This will zeroize all critical security parameters
ARE YOU SURE (yes, y, no, n): [no]y
Operation succeeded.
```

To delete a file from the local node:

```
SecurityAdmin:switch> cryptocfg --delete -file \ /etc/fabos/certs/sw0/foo.pem This will permanently delete the selected file. ARE YOU SURE (yes, y, no, n): [no] \mathbf{y}
```

To display local encryption engine information for a Brocade FS8-18 encryption blade on a DCX:

```
SecurityAdmin:switch> cryptocfg --show -localEE
EE Slot:
                     1
SP state:
                   Online
Primary Link KeyID: 85:1c:ca:dd:fc:8c:31:fc:87:21:26:d1:24:a0:92:be
Secondary Link KeyID:98:4f:b4:98:c0:42:ab:6b:6d:65:ba:f2:fc:aa:b5:8a
HA Cluster Membership:mace40_dcx74_1
EE Attributes:
Link IP Addr
              : 10.32.72.75
Link GW IP Addr : 10.32.64.1
Link Net Mask
              : 255.255.240.0
              : 00:05:1e:53:8d:cd
Link MAC Addr
              : 1500

To rebalance load between tape and disk LUNS for optimal performance on slot 1:
   switch:admin> cryptocfg --rebalance 1
   Rebalancing the EE may cause disruption to disk I/Os.
   Backup applications to tapes may need to be
   restarted after rebalance.
   ARE YOU SURE (yes, y, no, n): [no] yes
   Operation succeeded
To disable the key vault diagnostics:
   switch:admin> cryptocfg --kvdiag -disable
   Key vault diagnostic periodic tests Disabled
   Operation succeeded
To re-enable the key vault diagnostics after it has been disabled:
   switch:admin> cryptocfg --kvdiag -enable
   Key vault diagnostic periodic tests Enabled
   Interval:
              5 minute(s)
   Test Type:
                 (diag) key retrieval/archival readiness
   Operation succeeded
```

To display the key vault diagnostics configuration:

```
switch:admin> cryptocfg --kvdiag -show
   Key vault diagnostic periodic tests Enabled
   Interval:
                   5 minute(s)
   Test Type:
                 (diag) key retrieval/archival readiness
   Operation succeeded
To change the interval at which the key vault diagnostics is run:
```

```
switch:admin> cryptocfg --kvdiag -interval 60
Key vault diagnostic periodic tests Enabled
Interval:
              60 minute(s)
```

Test Type: (diag) key retrieval/archival readiness

Operation succeeded

```

DESCRIPTION

Use these cryptoCfg commands to create or delete an encryption group, to add or remove group member nodes, key vaults, and authentication cards, to enable or disable system cards, to enable quorum authentication and set the quorum size, to manage keys including key recovery from backup, to configure group-wide policies, and to sync the encryption group databases.

An encryption group is a collection of encryption engines that share the same key vault and are managed as a group. All EEs in a node are part of the same encryption group. An encryption group can include up to four nodes, and each node can contain up to four encryption engines. The maximum number of EEs per encryption group is sixteen (four per member node).

With the exception of the --help and --show commands, all group configuration functions must be performed from the designated group leader. The encryption switch or blade on which you create the encryption group becomes the designated group leader. The group leader distributes all relevant configuration data to the member nodes in the encryption group.

The groupCfg commands include three display options that show group configuration, runtime status, and group member information. Refer to the Appendix of the Fabric OS Encryption Administrator's Guide for a more comprehensive explanation of system states.

Use the --show -groupcfg command to display encryption group and member configuration parameters, including the following parameters:

- Encryption group name: user-defined label
- Encryption group policies:
 - Failback mode: Auto or Manual
 - Replication mode: Enabled or Disabled
 - Heartbeat misses: numeric value
 - Heartbeat timeout: value in seconds
 - Key Vault Type: LKM, RKM, SKM, TEMS, or TKLM
 - System Card: Disabled or Enabled
- For each configured key vault, primary and secondary, the command shows:
 - IP address: The key vault IP address
 - Certificate ID: the key vault certificate name
 - State: connected, disconnected, up, authentication failure, or unknown.
 - Type: LKM, RKM, SKM, TEMS, or TKLM
 - If an SKM key vault is configured in HA mode, no connection information is displayed because the system is unable to detect the connection status of an SKM appliance in an HA configuration.
- Additional diagnostic key vault information to facilitate troubleshooting of connectivity (For the TEMS and LKM key vaults, "Additional Primary Key Vault Information" and "Additional Secondary Key Vault Information" is displayed separately. For the SKM and RKM there is just one section "Additional Key Vault/Cluster Information"):

- Key Vault/CA Certificate Validity: Yes or No
- Port for Key Vault Connection: numeric identifier
- Time of Day on Key Server: time stamp or N/A
- Server SDK Version: revision number or N/A
- Diagnostic information for the encryption node (key vault client):
 - Node KAC Certificate Validity: Yes (valid) or No (invalid)
 - Time of Day on the Switch: time stamp
 - Client SDK Version: SDK revision number
 - Client Username: node login name for key vault
 - Client Usergroup: user group
 - Connection Timeout: time in seconds
 - Response Timeout: time in seconds
 - Connection Idle Timeout: time in seconds
 - Status message indicating success/readiness for key operations or, if there is a problem, displays a diagnostic message. For example, if the username on the switch has changed, but the key owner is still the old username, key operations will not be permitted.
- Quorum information includes the following parameters:
 - Authentication Quorum Size: 0 (disabled), 1- 5 (enabled).
 - Authentication Cards: Certificate ID /label or "not configured".
- Node list display includes the following parameters:
 - Total number of defined nodes: numeric value
 - Group leader node name: Node WWN
 - Encryption group state: CONVERGED = Encryption group formed successfully. CONVERGING
 Encryption group partially formed, member nodes may still be in discovery process.
 DEGRADED = Nodes lost connection with the group.
- For each node in the encryption group, the following information is displayed:
 - Node name: the node WWN
 - IP address: the node IP address
 - Role: GroupLeader or MemberNode

Use the **--show groupmember** command to display encryption group member information for one or all member nodes. Depending on the key vault configuration, the command displays master key information (RKM) or link key information (LKM).

- Node List (displayed only with the --all option)
 - Total number of defined nodes: numeric value
 - Group leader node name: the node WWN
 - Encryption group state: CONVERGED = Encryption group formed successfully. CONVERGING
 Encryption group partially formed, member nodes may still be in discovery process.
 DEGRADED = Nodes lost connection with the group.
- For each node, the display includes the following parameters:
 - Node Name: the node WWN
 - State: DISCOVERED = The node is part of the encryption group. DISCOVERING = The node is in the process of discovery.
 - Role: GroupLeader or MemberNode
 - IP address: the node IP address
 - Certificate: the node CP certificate name (user-defined)
 - Current master key (or primary link key) state: Not configured, Saved, Created, Propagated, Valid, or Invalid.

- Current master key ID (or primary link key ID): Shows key ID or zero if not configured.
- Alternate master key (or secondary link key) state: Not configured, Saved, Created. Propagated, Valid, or Invalid.
- Alternate master key ID (or secondary link key ID): Shows key ID or zeroif not configured.
- For each encryption engine, the command displays the following parameters:
 - EE slot number: the encryption engine slot number
 - SP state: refer to the appendix in the Fabric OS Encryption Administrator's Guide. Current master key ID (if RKM is configured) or primary link key ID (if LKM is configured).
 - Alternate master key ID (if RKM is configured) or secondary link keyID (if LKM is configured).
 - HA cluster name to which this encryption engine belongs, or "No HA cluster membership".
 - Media Type: DISK, TAPE, or MEDIA NOT DEFINED.

Use the --show -egstatus command with the -stat or -cfg option to display configuration or status information for all nodes in the encryption group. This command displays a superset of information included in the -groupcfg, -groupmember and -hacluster show commands. Refer to these commands for a description of display details.

NOTES

All encryption engines in the encryption group must be interconnected through a dedicated local area network (LAN), preferably on the same subnet and on the same VLAN using the GbE ports on the encryption switch or blade. The two GbE ports of each member node (Eth0 and Eth1) should be connected to the same IP Network, the same subnet, and the same VLAN. Configure the GbE ports (I/O sync links) with an IP address for the eth0 Ethernet interface, and also configure a gateway for these I/O sync links. Refer to the ipAddrSet help page for instructions on configuring the Ethernet interface.

These I/O sync link connections must be established before you enable the EEs for encryption. If these configuration steps are not performed, you cannot create an HA cluster, perform a first-time encryption, or initiate a rekeying session.

OPERANDS

The **cryptoCfg** group configuration function has the following operands:

--help -groupcfg

Displays the synopsis for the group configuration function. This command is valid on all nodes.

--create -encgroup

Creates an encryption group. The node on which this command is invoked becomes the group leader. You must specify a name when creating an encryption group. If stale encryption configurations exist on the node, this command displays a warning and prompts for confirmations to delete the configurations before creating the encryption group. A "no" response aborts the operation.

encryption group name

Specifies the name of the encryption group to be created. The name can be up to 15 characters long and include alphanumeric characters and underscores. White space, hyphens, and other special characters are not permitted.

--delete -encgroup

Deletes an encryption group with the specified name. This command is valid only on the group leader. This command fails if the encryption group has more than one node, or if any HA cluster configurations, CryptoTarget container/LUN configurations, or tape pool configurations exist in the encryption group. Remove excess member nodes and clear all HA cluster, CryptoTarget container/LUN, or tape pool configurations before deleting an encryption group.

encryption_group_name

Specifies the name of the encryption group to be deleted. This operand is required when deleting an encryption group.

--reg -keyvault

Registers the specified key vault (primary or secondary) with the encryption engines of all nodes present in an encryption group. Upon successful registration, a connection to the key vault is automatically established. This command is valid only on the group leader. Registered certificates are distributed from the group leader to all member nodes in the encryption group. Each node in the encryption group distributes the certificates to their respective encryption engines.

The following operands are required when registering a key vault:

cert label

Specifies the key vault certificate label. This is a user-generated name for the specified key vault. Use the **cryptocfg** --show -groupcfg command to view the key vault label after registration is complete.

certfile

Specifies the certificate file. This file must be imported prior to registering the key vault and reside in the predetermined directory where certificates are stored. In the case of the HP SKM, this operand specifies CA file, which is the certificate of the signing authority on the SKM. Use the **--show -file -all** command for a listing of imported certificates.

hostname | ip_address

Specifies the key vault by providing either a host name or IP address. If you are registering a key vault that is part of an RKM cluster, the value for *ip_address* is the virtual IP address for the RKM cluster and not the address of the actual key vault

primary | secondary

Specifies the key vault as either primary or secondary. The secondary key vault serves as backup.

--dereg -keyvault

Removes the registration for a specified key vault. The key vault is identified by specifying the certificate label. Removing a key vault registration disconnects the key vault. This command is valid only on the group leader.

cert_label

Specifies the key vault certificate label. This operand is required when removing the registration for a key vault.

--reg -KACcert

Registers the signed node certificate. After being exported and signed by the external signing authority, the signed node certificate must be imported back into the node and registered for a successful two-way certificate exchange with the key vault. This command is valid only on the group leader.

Registration functions need to be invoked on all the nodes in a DEK cluster for their respective signed node certificates. The following operands are required:

signed_certfile

Specifies the name of the signed node certificate to be reimported.

primary | secondary

Specifies the signing key vault as primary or secondary. This operand is valid only with the TEMS key vault, which requires the CSR to be signed by the primary or secondary vault. If both primary and secondary vaults are configured, this command must be run once for the primary and once for secondary key vault from every node.

--set -keyvault

Sets the key vault type. This command is valid only on the group leader.

value

Specifies the key vault type. The default is set to no value. This operand is required. Valid values for **-keyvault** include the following parameters:

LKM

Specifies the NetApp LKM appliance (trusted key vault).

RKM

Specifies the RSA Key Manager (RKM) (opaque key repository).

SKM

Specifies one of the following: the HP Secure Key Manager (SKM) or the HP Enterprise Secure Key Manager (ESKM). Both are opaque key repositories.

TEMS

Specifies the Thales nCipher key management appliance (opaque key

repository, a.k.a TEMS).

TKLM

Specified the Tivoli Key Lifetime Manager (TKLM) key repository

--set -failbackmode

Sets the failback mode parameter. This parameter is set on the group leader. Valid values for failback mode include the following parameters:

auto

Enables automatic failback. In this mode, failback occurs automatically within an HA cluster when an encryption switch or blade that failed earlier has been restored or replaced. Automatic failback mode is enabled by default.

manual

Enables manual failback. In this mode, failback must be initiated manually after an encryption switch or blade that failed earlier has been restored or replaced.

--set -hbmisses

Sets the number of heartbeat misses allowed in a node that is part of an encryption group before the node is declared unreachable. This value is set in conjunction with the time-out value. It must be configured at the group leader node and is distributed to all member nodes in the encryption group. The following operand is required:

value

Specifies the number of heartbeat misses. The default value is 3. The range is 1 to 15 in integer increments only.

--set -hbtimeout

Sets the time-out value for the heartbeat. This parameter must be configured at the group leader node and is distributed to all member nodes in the encryption group. The following operand is required:

value

Specifies the heartbeat time-out in seconds. The default value is 2 seconds. Valid values are integers in the range between 1 and 30 seconds.

--set -quorumsize

Sets the guorum size used to authenticate functions that require a guorum of authentication cards. The default value is zero. You can set the quorum size only if the current value is zero. Note that this value is different from the recovery set size that specifies the number of recovery shares used to perform Master Key recovery. When guorum authentication is enabled (Quorum Size is > 0), this operation requires authentication of a quorum of authentication cards.

value

Specifies the quorum size. Valid values are 0 (quorum authentication is disabled) and 1 through 5 (quorum authentication is enabled). This operand is required.

--set -systemcard> enable | disable

Enables or disables the system card usage policy. When the policy is enabled, a system card is required to be inserted in an encryption engine to enable encryption after a power-cycle event. When quorum authentication is enabled (Quorum Size is > 0), this operation requires authentication of a quorum of authentication cards. The policy is disabled by default. This command must be executed on the group leader.

--set -replication enable | disable

Enables or disables replication-specific features. You must enable replication before you can use replication-specific features such as the **-newLUN**, **-include_mirror**, or the **--refreshDEK** command. Replication is disabled by default; it must be enabled on the group leader. This command is supported only for the RKM key vault.

--add -membernode

Adds the specified member node to the existing encryption group. The member node is specified by its node WWN. This command is valid only on the group leader. Initial setup on the node must be performed prior to adding the node to an encryption group.

This command is required only when a node that was earlier part of encryption group (online and DISCOVERED) was ejected or left the encryption group and is now added back to that encryption group. A member node that is online during registration is added automatically to the encryption group. The following operand is required:

node_WWN

Specifies the WWN of the node to be added back to the encryption group.

--eject -membernode

Removes a member node from the existing encryption group. The node is specified by its node WWN. This command is valid only on the group leader. The node must be online (in DISCOVERED state) for this command to succeed. To remove a node that is not online (in DISCOVERING State), use the --dereg --membernode command. You must remove the EEs from the HA cluster and delete any Crypto Target container/LUN configurations from this node before ejecting the node or the command fails. The following operand is required when ejecting a member node:

node_WWN

Specifies the node WWN of the node to be removed from the encryption group.

--leave_encryption_group

Clears the node's states pertaining to the node's membership in the encryption group. This command is invoked from the member node that is to be ejected from the encryption group.

If there are CryptoTarget container/LUN configurations on the node and the encryption engines of this node are part of any HA Cluster configuration, this command prompts you to either continue leaving the encryption group while retaining the configuration, or to abort the leave operation. It is recommended that you remove the EEs from the HA cluster and delete any CryptoTarget container and Crypto LUN configurations from this node prior to initiating a leave operation.

--genmasterkey

Generates a master key. A master key is needed when an opaque key vault such as RKM is used. The master key must be exported (backed up) before it may be used. This command is valid only on the group leader. Only one master key per key vault is needed for the entire encryption group. When a master key is generated and a master key exists, the current master key becomes the alternate master Key and the newly generated master key becomes the current master key.

--exportmasterkey

Exports the current master key encrypted in a key generated from a specified pass phrase. By default this command backs up the key to the attached key vaults, or optionally to a predetermined file on the switch. This command is valid only on the group leader. This command prompts for a pass phrase.

passphrase

Specifies the pass phrase for the master key encryption. A pass phrase must be between 8 and 40 characters in length and can contain any character combination. Make a note of the pass phrase, because the same pass phrase is required to restore the master key from backup. This operand is required.

-file

Stores the encrypted master key in a predetermined file on the switch. This operand is optional. If the **-file** operand is not specified, the encrypted master key is stored in the attached key vaults, using a unique associate Key ID for tracking the export. Upon execution, this command displays both the associated Key ID and the master key ID. You can export the master key to the key vault more than once. Each time you export the same master key, the associate key ID is incremented, and both the master key ID and the associate key are displayed. Make a note of the key ID, because you will need same key ID is to restore the master key from backup.

--recovermasterkey

Restores the master key from backup. This command is valid only on the group leader. This command prompts for a pass phrase:

passphrase

Specifies the pass phrase for recovering the master key. The pass phrase must be the same that was used to back up the master key with the --exportmasterkey command.

currentMK | alternateMK

Specifies whether the master key should be restored to the current position or the alternate position. This command replaces the specified existing master key and should be exercised with caution. A master key is typically restored to the alternate position to enable decryption of older data encryption keys (DEKs) that were encrypted in that master key.

-keyID keyID

Specifies the associative master key ID. This option restores the master key from the key vault. The associative master key ID was returned when it was backed up to the key vault with the --exportmasterkey command. The -keyID and the -srcfile options are mutually exclusive.

-srcfile filename

Specifies the file name when restoring the master key from a file in the predetermined directory on the switch. Use this operand when the master key was backed up to a file rather than to a key vault. The -keyID and the -srcfile operands are mutually exclusive.

--show -mkexported_keyids key_id

Displays all exported key IDs used to store a particular master key on keyvault. The key ID must be in the format displayed in the output of the cryptocfg --show -localEE command. This command is valid on any node connected to the key vault.

--show -groupcfg

Displays the group-wide encryption policy configuration. This command is valid on all member nodes and on the group leader.

--show -groupmember

Displays detailed information for all encryption group members or for a single member. This command is valid on all member nodes and on the group leader. The following required operands are mutually exclusive:

-all

Displays information on all nodes in the existing encryption group.

node_WWN

Displays information on a single specified node. The node is identified by its node WWN.

--show -egstatus

Displays encryption group configuration or status information for all nodes in the encryption group. The following operands are exclusive:

-cfg

Displays encryption group configuration information.

-stat

Displays encryption group status information.

--sync -encgroup

Manually synchronizes the encryption group database belonging to the group leader node with the databases of all member nodes that are out of sync. If this command is invoked when the encryption group databases are in sync, the command is ignored.

Note: When the encryption group is out of sync and the group leader reboots, the newly selected group leader pushes its database information to all other members. The new group leader's database information may be different from what was set up before the group leader was rebooted.

--sync -securitydb

Distributes the security database from the group leader node to all member nodes. This operation can resolve problems with master key propagation. The synchronization occurs every time this command is executed regardless of whether or not the security database was in sync across all nodes in the encryption group. This command is valid only on the group leader.

EXAMPLES To create an

To create an encryption group "brocade":

```
SecurityAdmin:switch> cryptocfg --create -encgroup brocade Encryption group create status: Operation Succeeded.
```

To create an encryption group "brocade" on a node that has stale configurations:

```
SecurityAdmin:switch> cryptocfg --create -encgroup brocade

Warning: There are stale (Container|HA|Tape) cryptodb configurations.

Please confirm to delete them.

ARE YOU SURE (yes, y, no, n): [no] y

Warning: These are the list of crypto configuration \

to be cleaned up:

Inside /etc/fabos/mace (crypto_dek.db.0, crypto_dev.db.0, \
    crypto_hac.db.0, crypto_pool.db.0, crypto_wwn.db.0).

ARE YOU SURE (yes, y, no, n): [yes]y

Encryption group create status: Operation Succeeded.
```

To delete the encryption group "brocade":

```
SecurityAdmin:switch> cryptocfg --delete -encgroup brocade Encryption group create status: Operation Succeeded.
```

```
To register a NetApp LKM appliance as the primary key vault "LKM1":
```

```
SecurityAdmin:switch> cryptocfg --reg -regkeyvault \
   LKM1 lkmcert.pem 10.33.54.231 primary decru-lkm-1
Register key vault status: Operation Succeeded.
```

To set the key vault type to LKM:

```
SecurityAdmin:switch> cryptocfg --set -keyvault LKM
Set key vault status: Operation Succeeded.
```

To add a member node to the encryption group:

```
SecurityAdmin:switch> cryptocfg --add -membernode \
   10:00:00:05:1e:39:14:00
Add node status: Operation Succeeded.
```

To eject a member node from the encryption group:

```
SecurityAdmin:switch> cryptocfg --eject -membernode \
    10:00:00:05:1e:53:b8:45
Eject node status: Operation Succeeded.
```

To leave the encryption group:

```
SecurityAdmin:switch> cryptocfg --leave_encryption_group
Leave node status: Operation Succeeded.
```

To generate the master key (RKM) on the group leader:

```
SecurityAdmin:switch> cryptocfg --genmasterkey
Master key generated. The master key should be
exported before further operations are performed.
```

To export the master key to the RKM key vault:

```
SecurityAdmin:switch> cryptocfg --exportmasterkey
Enter passphrase: ********
Confirm passphrase:*******
Master key exported.
Master Key ID: 11:95:82:cd:80:88:41:31:42:dd:c3:5f:d0:a7:95:55
Exported Key ID: 11:95:82:cd:80:88:41:31:42:dd:c3:5f:d0:a7:95:56
Master key exported.
```

To export the master key to a file:

```
SecurityAdmin:switch> cryptocfg --exportmasterkey -file
Enter the passphrase: ********
Master key file generated.
```

To export the master key file to an external host:

```
SecurityAdmin:switch> cryptocfg --export -scp \
   -currentMK 192.168.38.245 mylogin GL_MK.mk
Password:********
Operation succeeded.
```

To recover the master key from the key vault to the current location:

```
SecurityAdmin:switch> cryptocfg --recovermasterkey currentMK -keyID \
    bd:ae:2d:0b:b9:1a:ad:18:0d:eb:fe:c9:67:ed:29:b0

Enter the passphrase: passphrase
Recover master key status: Operation succeeded.

To display the saved key IDs associated with a repeatedly exported master key
SecurityAdmin:switch> cryptocfg --show \
```

```
-mkexported_keyids e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:92
e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:92
e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:93
e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:94
e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:95
e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:96
e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:97
e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:98
e3:ae:aa:89:ec:12:0c:04:29:61:9c:99:44:a3:9b:99
Operation Succeeded.
```

To display the encryption group configuration:

```
SecurityAdmin:switch> cryptocfg --show -groupcfg
Encryption Group Name: system_test
   Failback mode:
                       Auto
   Replication mode:
                       Disabled
   Heartbeat misses:
   Heartbeat timeout: 2
   Key Vault Type:
   System Card:
                       Disabled
Primary Key Vault:
   IP address:
                       10.32.49.200
   Certificate ID:
                       3D2-LKM3-B05-200
   Certificate label: LKM200
   State:
                       Connected
   Type:
                       LKM
Secondary Key Vault:
   IP address:
                       10.32.49.201
   Certificate ID:
                      3D2-LKM4-B05-201
   Certificate label: LKM201
   State:
                       Connected
   Type:
                       T.KM
Additional Primary Key Vault Information::
  Key Vault/CA Certificate Validity:
                                          Yes
   Port for Key Vault Connection:
                                          32579
  Time of Day on Key Server:
                                          N/A
  Server SDK Version:
                                          N/A
Additional Secondary Key Vault Information:
  Key Vault/CA Certificate Validity:
                                         Yes
  Port for Key Vault Connection:
                                          32579
  Time of Day on Key Server:
                                          NT / A
  Server SDK Version:
                                          N/A
Encryption Node (Key Vault Client) Information:

```

FUNCTION

SYNOPSIS

cryptocfg --replace [-haclustermember HA_cluster_name] current_node_WWN [slot] new_node_WWN [slot]

cryptocfg --show -hacluster -all | HA_cluster_name

DESCRIPTION

Use these cryptoCfg commands to configure and manage High Availability (HA) clusters.

An HA cluster consists of two encryption engines configured to host the CryptoTargets and to provide the active/standby failover and failback capabilities in a pair-wise relationship in a single fabric. The encryption engines that are part of an HA cluster must belong to the same encryption group and be part of the same fabric.

Failure to ensure that HA cluster members are part of the same encryption group dissolves the HA cluster and the encryption engines lose their failover capability.

The HA cluster configuration must be performed on the group leader. Configuration changes must be committed before they take effect. Use the cryptocfg --commit command to commit a new configuration or a configuration change. Refer to section "5. Transaction management" for more information. Any operation related to an HA cluster performed without a commit operation will not survive across switch reboots, power cycles, CP failover, or HA reboots.

The command group includes a show option, --show -hacluster. When invoked on a member node, this command displays the committed HA cluster configuration. When invoked on the group leader, both defined and committed configuration data is displayed including the following parameters:

- Encryption group name: A user-defined name
- Number of HA clusters in the existing encryption group: numeric value
- For each HA cluster:
 - HA cluster name: user-defined label
 - Number of encryption engine entries: numeric value
 - HA cluster Status: Committed or Defined
- For each encryption engine member in the HA cluster:
 - EE WWN: the encryption group world wide name
 - EE slot number: the encryption group slot number
 - EE status: online or offline

OPERANDS

The **cryptoCfg** HA cluster configuration function has the following operands:

--help -hacluster

Displays the synopsis for the HA cluster configuration function. This command is valid on all nodes.

--create -hacluster

Defines an HA cluster with a specified name and optionally associates up to two encryption engines with the HA cluster. This command is valid only on the group leader. The EEs must be members of the same encryption group as the group leader on which this command is issued. This command fails if the member nodes' IP addresses for the GbE ports (I/O sync ports) are not configured. The encryption engines must belong to different switches or chassis. This rule is enforced by the CLI to ensure redundancy.

The following operands are supported:

HA cluster name

Specifies the name for the HA cluster. The name can be up to 31 characters long and can include alphanumeric characters, hyphens, and underscores. White space and other special characters are not permitted. This operand is required.

node_WWN

Specifies the WWN of the switch or chassis to which the encryption engine belongs. This operand is optional; if omitted, only the HA cluster name is defined. You may add EEs separately with the **--add -haclustermember** command.

slot

Specifies the encryption engine slot number on bladed systems.

--delete -hacluster

Deletes the HA cluster with the specified name. This command is valid only on the group leader. The following operand is required:

HA_cluster_name

Specifies the name of the HA cluster to be deleted.

--add -haclustermember

Adds one or more encryption engine members to an already configured HA. A maximum of two HA cluster members is currently supported. The EEs must be part of the same encryption group as the node on which this command is issued. This command is valid only on the group leader. The encryption engines must belong to different switches or chassis. This rule is enforced by the CLI to ensure redundancy.

The following operands are required with the **--add** command:

node_WWN

Specifies the node WWN of the switch or chassis to which the encryption engine belongs.

slot

Specifies the encryption engine slot number on bladed systems.

--remove -haclustermember

Removes one or both encryption engine members from an already configured HA cluster. This command is valid only on the group leader. This command only removes the failover/failback capability for the removed EEs; it does not affect the relationship between configured CryptoTarget containers and the encryption engine that is removed from the HA cluster. The containers still belong to this encryption engine and encryption operations continue.

The following operands are required with the **--remove** command:

node_WWN

Specifies the WWN of the switch or chassis to which the encryption engine belongs.

slot

Specifies the encryption engine slot number on bladed systems.

--replace -haclustermember

Replaces an encryption engine, either failed or alive, with an alternate encryption engine. All target associations for the current encryption engine are transferred over to the alternate encryption engine when this command is executed. The alternate encryption engine does not have to be part of the current HA cluster. Upon successful replacement, the alternate encryption engine automatically becomes part of the configured HA cluster and disrupted peer relationships are repaired. This command is only valid on the group leader.

The following operands are supported with the **--replace** command:

HA_cluster_name

Specifies the HA cluster member to be replaced. The HA cluster name must be specified when this operand is used. This operand is optional. It is not needed if the encryption engine to be replaced is not part of an HA cluster.

current_node_WWN [slot

Specifies the WWN of the encryption engine to be replaced. This operand is required. On bladed systems, include the encryption engine slot number.

new_node_WWN [slot]

Specifies the WWN of the encryption engine that is to replace the current encryption engine. This operand is required. On bladed systems, include the encryption engine's slot number.

--show -hacluster

Displays the specified HA clusters in the encryption group and associated state information for all HA clusters or for a single, specified HA cluster. When invoked on a member node, only the committed HA cluster configuration is displayed. When invoked on the group leader, both defined and committed configuration data is displayed.

The following operands are mutually exclusive:

-all

Displays configuration information for all HA clusters.

HA_cluster_name

Displays configuration information for a specified HA cluster.

EXAMPLES

To display existing HA clusters in the encryption group "brocade" (the encryption group in the example has one committed HA cluster with one encryption engine):

```
SecurityAdmin:switch> cryptocfg --show -hacluster -all
Encryption Group Name: brocade
Number of HA Clusters: 1
HA cluster name: HAC1 - 1 EE entry
        Committed
Status:
                     Slot Number Status
11:22:33:44:55:66:77:00
                      0
                                Online
```

To create a second HA cluster with one encryption engine:

```
SecurityAdmin:switch> cryptocfg --create -hacluster HAC2
10:00:00:05:1e:53:4c:91
EE Node WWN: 10:00:00:05:1e:53:4c:91 Slot number: 0 Detected
Create HA cluster status: Operation succeeded.
```

To add another encryption engine to HA cluster HAC2:

```
SecurityAdmin:switch> cryptocfg --add -haclustermember HAC2
10:00:00:05:1e:53:74:87 3
EE Node WWN: 10:00:00:05:1e:53:74:87 Slot number: 3 Detected
Add HA cluster member status: Operation succeeded.
```

To display the changes (Note that "HAC2" is in the "defined" state until the transaction is committed):

```
SecurityAdmin:switch> cryptocfg --show -hacluster -all
Encryption Group Name: brocade_1
Number of HA Clusters: 2
HA cluster name: HAC1 - 1 EE entry
         Committed
Status:
        WWN
                      Slot Number
                                    Status
11:22:33:44:55:66:77:00
                       0
                                    Online
```

```
HA cluster name: HAC2 - 2 EE entries
   Status:
                      Defined
             WWN
                              Slot Number
                                              Status
   10:00:00:05:1e:53:4c:91
                                   0
                                              Online
   10:00:00:05:1e:53:74:87
                                   3
                                              Online
To replace an encryption engine in HA cluster "HAC2":
   SecurityAdmin:switch> cryptocfg --replace \
        -haclustermember HAC2 10:00:00:05:1e:53:4c:91 \
        10:00:00:05:1e:39:53:67
   Replace HA cluster member status: Operation Succeeded.
To remove HA cluster member 10:00:00:05:1e:53:74:87 from the HA cluster "HAC2":
   SecurityAdmin:switch> cryptocfg --rem -haclustermember \
        HAC2 10:00:00:05:1e:53:74:87
   Remove HA cluster member status: Operation Succeeded.
To delete a previously created (committed) HA cluster named HAC1:
   SecurityAdmin:switch> cryptocfg --delete -hacluster HAC1
   Delete HA cluster status: Operation succeeded
To commit the changes:
   SecurityAdmin:switch> cryptocfg --commit
   Operation Succeeded
To view the changes:
   SecurityAdmin:switch> cryptocfg --show -hacluster -all
   Encryption Group Name: brocade_1
   Number of HA Clusters: 1
   HA cluster name: HAC2 - 1 EE entry
   Status:
                     Defined
                              Slot Number
             MWM
                                             Status
   10:00:00:05:1e:39:53:67
                                             Online
To initiate a manual failback of an encryption engine:
   SecurityAdmin:switch> cryptocfg --failback -EE
   10:00:00:05:1e:39:53:67 0 22:00:00:04:cf:6e:57:62
   Operation Succeeded
4. Storage device configuration and management
cryptocfg --help -devicecfg
cryptocfg --create -container disk | tape
  crypto_target_container_name
  EE_node_WWN [EE_slot] target_PWWN target_NWWN
  [-initiator initiator_PWWN initiator_NWWN
  [initiator_PWWN initiator_NWWN]...]
cryptocfg --delete -container crypto_target_container_name
```

cryptocfg --failback -EE current_node_WWN [current_slot]

new_node_WWN [new_slot]

FUNCTION

SYNOPSIS

```

DESCRIPTION

Use these **cryptoCfg** commands to configure and manage tape or disk devices that store the encrypted and compressed data.

A CryptoTarget container (CTC) is a configuration of "virtual devices" that is created for each target port hosted on a Brocade Encryption Switch or FS8-18 blade. The container holds the configuration information for a single target, including associated hosts and LUN settings. A CryptoTarget container interfaces between the encryption engine, the external storage devices (targets), and the initiators (hosts) that can access the storage devices through the target ports.

Virtual devices redirect the traffic between host and target/LUN to encryption engines so they can perform cryptographic operations. To enable frame redirection, you must create a target-initiator zone prior to performing any CryptoTarget container configuration.

The CryptoTarget container (CTC) and associated Crypto LUN configuration is always configured from the group leader node, and the configuration is subsequentlyn propagated to all members in the encryption group.

CTC configuration uses a transaction model. Configuration changes must be committed before they take effect. Use the cryptocfg --commit command to commit the transaction. Refer to section "5. Transaction management" for more information.

This command set supports the following tasks:

- Configure and manage CryptoTarget containers (CTCs). Create, move, or delete a CTC, add or remove initiators (hosts permitted to access the targets), or manually initiate a failback of an encryption engine.
- Configure and manage logical unit numbers (LUNs) for disk and tape storage devices: add a LUN to a CTC, set or modify LUN encryption policy parameters, or remove a LUN from a CTC. Perform LUN
- Configure and manage tape pools: create a tape pool, set or modify tape pool encryption policies, or delete a tape pool. Perform LUN discovery.
- Manage rekey operations for primary and mirror LUNS.
- Reallocate or change the world wide name (WWN) of virtual entities that have been moved or removed from an encryption group. This operation is indicated when you want to eject a Brocade Encryption Switch from an encryption group as a result of a move operation or a split EG, or if you intend to remove an FS8-18 Encryption blade from an encryption group.

In addition, this command set includes the following display commands. Output may vary depending on your configuration. Refer to the Appendix of the Fabric OS Encryption Administrator's Guide for a more comprehensive explanation of system states.

Use the --show -container -all -stat command for runtime status information on all CryptoTarget containers in the encryption group. The display includes the following information:

- Encryption group name: user-define label
- Number of containers numeric value
- For each container:
 - Container name: user-defined label
 - Type: disk or tape
 - EE node: The node WWN
 - EE slot: the slot number for the encryption engine
 - Target: The target port WWN
 - Target PID: The target PID
 - VT: The virtual target port WWN
 - VT PID: The virtual target PID
 - Number of hosts: numeric value
 - Number of tape sessions (or rekey sessions): numeric value
 - Host: The port WWN
 - Host PID: The host PID
 - VI: The virtual initiator port WWN
 - VI PID: The virtual initiator PID
 - Number of LUNs: numeric value
 - LUN number: numeric ID
 - LUN type: disk or tape drive, tape medium changer, tape attached medium changer, tape offline/unknown, or unsupported/other
 - LUN serial number: The LUN serial number
 - Encryption mode: encrypt or cleartext
 - Encryption format: (brocade) native or DF-compatible
 - Tape policy type: pool-based, LUN-based

- Encrypt existing data: disabled or enabled
- Rekey: disabled or enabled
- Key life: the key life span (in days)
- Volume/Pool label: the label for the tape volume or tape pool
- Internal EE LUN state: Encrypted, Cleartext, or Disabled (Data state is cleartext but metadata exists on the LUN, or vice versa.)
- Encryption algorithm: AES256-ECB (DF_compatible), AES256-GCM (native) or None (cleartext)
- Key ID state: Read, Write, or Key ID not applicable
- Key ID: The Key ID (if available)
- New LUN: Yes or No
- Replication LUN type: Primary or Mirror
- Tape session number: numeric value
- Number of uncompressed blocks: numeric value

Use the **--show -container -all -cfg** command for configuration information on all CryptoTarget containers in the encryption group, or specify a *crypto_target_container_name* for information on a specified CTC. The display includes the following information:

- Encryption group name: user-defined label
- Number of containers: numeric value
- For each container
 - Container name: a user-defined label
 - Type: tape or disk
 - EE node: the node WWN
 - EE slot: numeric value
 - Target: target port WWN, node WWN
 - VT: virtual target port WWN, node WWN
 - Number of hosts: numeric value
 - Configuration status: committed or defined
 - For each host: the host port WWN and the node WWN
 - For each VI: the virtual initiator port WWN and the node WWN
 - Number of LUNs: numeric value

If a rekey session is in progress while the command is run, the following additional information is displayed:

- LUN number: numeric ID
- LUN type: disk, tape drive, tape medium changer, tape attached medium changer, offline/unknown, or unsupported/other
- LUN serial number (disk only): alpha-numeric ID
- Encryption mode: encrypt or cleartext
- Encryption format: native or DF compatible
- Encrypt existing data: enabled or disabled
- Rekey: enabled or disabled
- LUN state: refer to the appendix in the Fabric OS Encryption Administrator's Guide
- Encryption algorithm: AES256 -XTS (disk), AES256-CCM (tape), or none
- Key ID state: Rekey
- Key ID: numeric identifier
- Key creation time: date and time of key creation

- Key life (in days); number of days until expiration
- Rekey status: numeric value
- Key expiration time
- Rekey session number: numeric value
- Percentage complete
- Rekey state: Read or write Phase
- Rekey role: primary, alternate
- Block size: numeric value
- Number of blocks: numeric value
- Current logical block address (LBA) being processed

Use the --show -tapepool command to display tape pool configuration parameters for all Tape pools or for a specific tape pool. For each tape pool, the display includes the following information:

- tape pool Label: user-define label
- Key Life: Life span in days
- Encryption mode: encrypt or cleartext
- Encryption format: native or DF compatible
- Configuration status: committed or defined

Use the --show -LUN command for a listing of Crypto LUN status or configuration information for a specific CTC.

When used with -stat the display includes the following LUN runtime status information:

- Container name: user-defined label
- Type: disk or tape
- EE node: node WWN
- EE slot: EE slot number
- Target: target port WWN and node WWN
- Target PID
- VT: virtual target port WWN and node WWN
- VT PID: virtual target PID
- Number of hosts: numeric value
- Number of rekey (or tape) sessions: numeric value
- For each host:
 - Host PWWN, NWWN: host port WWN and node WWN
 - Host PID: host port ID
 - VI PWWN, NWWN: virtual initiator port WWN and node WWN
 - VI PID: virtual initiator port ID
- Number of LUNs: numeric value
- For each LUN:
 - LUN number: numeric value
 - LUN type: disk, tape drive, tape medium changer, tape attached medium changer, offline/unknown, or unsupported/other
 - LUN serial number: alpha-numeric ID
 - Encryption mode: encrypt or cleartext
 - Encryption format: native or DF-compatible
 - Encrypt existing data: enabled or disabled
 - Rekey: enabled or disabled

- Tape policy type: pool-based or LUN-based
- Key life: key lifespan in days
- Volume/pool label
- LUN state: Refer to the Fabric OS Encryption Administrator's Guide.
- Encryption algorithm: AES256 -XTS (disk), AES256-CCM (tape), or none
- Compression algorithm
- Key ID state: available or not available
- Key ID: numeric identifier if available
- New LUN: Yes or No
- Replication LUN type: Primary or Mirror

If the LUN is a disk and the LUN is enabled for auto rekey, the following additional information is displayed below the Key ID. Refer to the example section for an illustration.

- Key creation time: date and time
- Key life: remaining time (in days) until the key expires
- Rekey status: 0 = rekey in progress, 1 = no rekey in progress
- Key expiration time: date and time
- Time remaining to Auto Rekey: Displays key life for LUNs that
- are currently being rekeyed and after the rekey is complete.
- The remaining Key life period is displayed in the following format: *num_yrs*, *num_months*, *num_days*, *num_minutes*.

When used with **-cfg** the **--show -LUN** command displays LUN configuration information:

- EE node: node WWN
- EE slot: slot number
- Target: target port WWN and node NWWN
- VT: virtual target port WWN and node WWN
- Number of hosts: numeric value
- Configuration status: committed or defined
- For each host:
 - Host port WWN and node WWN
 - Virtual initiator port WWN and node WWN
 - Virtual initiator PID
- Number of LUNs
- For each LUN:
 - LUN number: numeric identifier
 - LUN type: disk, tape drive, tape medium changer, tape attached medium changer, offline/unknown, or unsupported/other
 - LUN status: numeric value
 - Encryption mode: encrypt or cleartext
 - Encryption format: native or DF compatible
 - Tape policy type: pool-based or LUN-based
 - Encrypt existing data: disabled or enabled
 - Rekey: disabled or enabled
 - Key ID state: Read, Write, or Key ID not applicable
 - Key life (in days): numeric value

- Volume/pool label: user-defined label
- Rekey status: numeric value

If rekey- or tape sessions are in progress, the command shows the following information:

- Number of rekey sessions in progress: numeric value
- For each rekey session the display includes the following parameters:
 - Rekey session number: numeric value
 - Percent completion: numeric value
 - Rekey state: Read or Write phase

Use the --show -rekey command to display all rekey sessions in progress on the current node or for a specified container. The display includes the following information:

- Number of rekey sessions in progress: numeric value
- For each rekey session, the display includes the following parameters:
 - Container name: user-define label
 - EE node: node WWN
 - EE slot: Slot number
 - Target: target port WWN and node WWN
 - Target PID: target PID
 - VT: virtual target port WWN and node WWN
 - VT PID: virtual target PID
 - Host (initiator) PWWN
 - Host (initiator): node WWN
 - Host (initiator) PID: hoist PID
 - VI: virtual initiator port WWN and node WWN
 - VI PID: virtual initiator PID
 - LUN Number: numeric identifier
 - LUN Serial Number: alpha-numeric identifier
 - Percentage complete: numeric value
 - Rekey state displays one of the following parameters:
 - Read Phase
 - Write Phase
 - HA Sync Phase
 - LUN Cleanup
 - Rekey role: Primary or Backup
 - Block Size: in KB
 - Current logical block address (LBA) being processed: block address

Use the --show -rekey crypto_target_container_name_LUN_Num_initiator_PWWN command to display all rekey sessions in progress for a specific Crypto LUN/initiator pair of a specific CryptoTarget container. The display includes the following information:

- LUN number: numeric ID
- LUN Serial Number (SN): alpha-numeric label
- CryptoTarget container Name: user-defined name
- Target: target port WWN and node WWN
- Target PID: target PID
- EE node name: node WWN
- EE slot: slot number

- Number of rekey sessions in progress: numeric value
- For each rekey session the display includes the following parameters:
 - Rekey session number: numeric value
 - Percent completion: numeric value
 - Rekey state. Displays one of the following parameters:
 - □ Rekey Setup
 - LUN Prep
 - Key Update
 - Operation in progress. Displays one of the following parameters:
 - Read Phase
 - Write Phase
 - HA Sync Phase
 - LUN Cleanup
 - VI: virtual initiator port WWN and node WWN
 - VI PID: virtual initiator PID
 - Number of blocks: numeric value
 - Block size: numeric value (in KB)
 - Size of the LUN (in bytes)
 - Current logical block address (LBA) being processed
 - Rekey Role: Primary Or Backup

Use the **--show -tape_sessions** command to display all tape sessions in progress on the local node or for a specific container. The display includes the following information:

- Number of tape sessions in progress: numeric value
- Container name: user-defined label
- EE node name: node WWN
- EE Slot Number: slot number
- Target: target port WWN and node WWN
- Target PID: Target PID
- VT: virtual target port WWN and node WWN
- VT PID: virtual target PID
- Host: host port WWN and node WWN
- Host PID: host PID
- VI: virtual initiator port WWN and node WWN
- VI PID: virtual initiator PID
- LUN number: numeric identifier
- Tape session number: numeric identifier
- For each Tape session:
 - Number of uncompressed blocks: numeric value
 - Number of compressed blocks: numeric value
 - Number of uncompressed bytes: numeric value
 - Number of compressed bytes: numeric value

NOTES

Encryption groups and HA clusters must be configured before performing any CryptoTarget container and Crypto LUN configurations.

When adding a LUN to a CryptoTarget container, special attention should be paid to the input format. A LUN number can be entered either as a 16-bit (2 bytes) number in hex notation (for example, 0x07) or as a 64-bit (8 bytes) number in WWN format (for example, 00:07:00:00:00:00:00:00). Although the command does accept decimal input, it is not recommended. The conversion function used to parse the LUN number converts a decimal number beginning with 0 to an octal, which results in a conversion error. For example, 035 is interpreted as 29 (decimal), or 0x1D hex, or 00:1D:00:00:00:00:00:00. To ensure correct conversion to decimal notation, use the recommended Hex formats or make sure to remove preceding zeros from decimal input.

OPERANDS

The **cryptoCfg** storage device configuration and management function has the following operands:

--help -devicecfg

Displays the synopsis for the storage device configuration and management function. This command is valid on all nodes.

--create -container

Creates a CryptoTarget container (CTC) for a disk or a tape storage device. The target device port WWN must be specified and one or more initiator port WWNs (PWWNs) may optionally be specified. Additional initiator PWWNs may be added after the CryptoTarget container is created.

Upon commit of a CTC configuration, one virtual target (VT) is created, and for each initiator that has the access to the target port, one virtual initiator (VI) is created. These virtual devices are created by logging into the fabric and registering with the Name Server. Initiator and target must be zoned for NS-based frame redirection to take effect. Use the **nsShow** command to verify the creation of the virtual devices. Use the **cfgShow** command to view the redirection zone.

This command is valid only on the group leader. The following operands are supported:

disk | tape

Specifies the type of the CTC as a disk array or tape storage container depending on the target device. These operands are mutually exclusive.

crypto_target_container_name

Specifies the CTC name for the storage device. The CTC name can be up to 31 characters long and include any alphanumeric characters, hyphens, and underscores. White space and other special characters are not permitted. This operand is required.

EE node WWN [EE slot

Specifies the WWN of the node to which the encryption engine belongs and on which encryption engine this particular CTC is hosted. This operand is required. On bladed systems, include the slot number.

target_PWWN

Specifies the target port WWN of the device port hosted on the encryption engine. This operand is required.

target NWWN

Specifies the target node WWN. This operand is required.

-initiator

Specifies one or more initiators. Specifying initiators within a CTC does not mean that these initiators have access to the Crypto LUN. The initiator PWWNs still need to be specified when the LUN is added to the CTC to which these initiators should gain access. The initiators added to the CTC are used only for discovering the LUNs of the target as exposed to these initiators.

This operand is optional. You may add initiators at the time when the CTC is created or any time thereafter with the **--add -initiator** command. The following operands are required when specifying an initiator:

initiator_PWWN

Specifies the initiator port WWN.

initiator_NWWN

Specifies the initiator node WWN.

--delete -container

Deletes a specified CTC. This command removes the virtual target and associated LUNs from the fabric. Before issuing this command, you must stop all traffic to the target port for which the CTC is being deleted. Failure to do so results in I/O failure between the initiators and that target Port.

This command is valid only on the group leader. The following operand is required when deleting a CTC:

crypto_target_container_name

Specifies the name of the CTC to be deleted. Use the **cryptocfg --show -container** command for a listing of valid CTC names.

--failback -EE

Performs a manual failback of all CTCs that were failed over earlier to another encryption engine within an HA cluster to a "new" specified encryption engine. This command generates an error if the specified current encryption engine and new encryption engine are not members of the same HA cluster or if the current encryption engine or the new encryption engine are offline.

This command is valid only on the group leader. The following operands are required:

current_node_WWN [current_slot]

Specifies the node WWN of the current encryption engine to which failover occurred earlier, and which is now performing all encryption tasks. On bladed systems, specify the slot number of the current encryption engine.

new_node_WWN [new_slot]

Specifies the node WWN of the encryption engine to which failback of all CTCs should occur. On bladed systems, specify the slot number of the new encryption engine.

--move -container

Moves the specified CTC from its currently configured encryption engine to another encryption engine. This command is valid only on the group leader. The EEs must be part of the same encryption group for this operation to succeed, but they do not need to be part of the same HA cluster. This operation permanently changes the encryption engine association of a single CTC from an existing encryption engine to another encryption engine. To move all CTCs hosted on an encryption engine permanently to another encryption engine, use the **cryptocfg** --replace command.

This command is valid only on the group leader. The following operands are required when moving a CTC:

crypto_target_container_name

Specifies the name of the CTC to be moved.

new_node_WWN [new_slot]

Specifies the encryption engine to which the CTC should be moved. On bladed systems, specify the encryption engine's slot number.

--add -initiator

Adds one or more initiators to an existing CTC. An initiator that is added to a CTC facilitates discovering the LUNs of the target as exposed to these initiators. You must still add the initiators when you add the LUN to the CTC to enable access for these initiators.

This command is valid only on the group leader. The following operands are required when adding an initiator to a CTC:

crypto_target_container_name

Specifies the name of the CTC to which the initiators should be added.

initiator PWWN

Specifies the initiator port WWN.

initiator NWWN

Specifies the initiator node WWN.

--remove -initiator

Removes an initiator from the specified CTC. This command is valid only on the group leader. The following operands are required when removing anm initiator:

crypto_target_container_name

Specifies the name of the CTC from which the initiator is to be removed.

initiator_PWWN

Specifies the initiator port WWN.

--add -LUN

Adds a LUN to a CTC and optionally sets encryption policies for the LUN. The maximum number of Tape LUNs that can be added to an Initiator in a container is 8. LUN policies may be set at this time or after the LUN is added. The maximum number of LUNs you can add in one commit operation is 25. There is a delay of five seconds for each commit operation.

This command is valid only on the group leader. The following operands are supported:

crypto_target_container_name

Specifies the name of the CTC to which the LUN is added. This operand is required.

LUN_Num | LUN_Num_Range

Specifies the LUN number or a range of LUN numbers. These operands are mutually exclusive. The LUN number can be either a 16-bit (2 bytes) number in hex notation (for example, 0x07) or a 64-bit (8 bytes) number in WWN format (for example, 00:07:00:00:00:00:00:00). When specifying a range, the LUN numbers must be 16-bit numbers in hex format. The Range parameter is not supported for 64-bit LUN numbers.

The LUN number must be zero when a tape LUN is specified and the tape drive is a single LUN device.

initiator PWWN initiator NWWN

Optionally specifies one or more hosts (initiators) that will be permitted to access the LUN. For each initiator added, the port WWN and the node WWN must be specified. You may add more than one initiator.

Encryption policy parameters: The following encryption policy configuration parameters can be optionally set for disk and tape devices when adding a LUN to a CTC, or they can be set at a later time with the --modify -LUN command.

The tape policies specified at the LUN level take effect if you do not create tape pools or configure policies at the tape pool level.

LUN policies are configured per HA or DEK cluster. For multi-path LUNs exposed through multiple target ports and thus configured on multiple CTCs on different EEs in an HA cluster or DEK cluster, the same LUN policies must be configured. Refer to the *Fabric OS Administrator's Guide* for more information.

The following LUN policy parameters can be optionally set:

-lunstate encrypted | cleartext

Sets the encryption state of a specified disk LUN. When set to encrypted, metadata on the LUN containing the key ID of the DEK that was used for encrypting the LUN is used to retrieve the DEK from the key vault. If the LUN state is not specified, the default state is cleartext. This operand is not valid for tape LUNs.

-keyID keyID

Specifies the Key ID. Use this operand only if the LUN was encrypted but does not include the metadata containing the keyID for the LUN. This is a rare case for LUNS encrypted in Brocade native mode. However for LUNS encrypted with DataFort v2.0, a Key ID is required, because these LUNs do not contain any metadata. This operand is not valid for tape LUNs.

-encryption_format native | DF_compatible

Specifies the LUN encryption format. Two encryption formats are supported:

native

The LUN uses the Brocade metadata format and algorithm for the encryption and decryption of data. This is the default mode.

DF_compatible

The LUN uses the NetApp DataFort metadata format and algorithm for the encryption and decryption of data. Use of this format requires a NetApp DataFort-compatible license to be present on the encryption switch or the chassis that houses the encryption blade.

-encrypt | -cleartext

Enables or disables the LUN for encryption. By default, cleartext is enabled (no encryption). When the LUN policy is changed from encrypt to cleartext, the following policy parameters become disabled (default) and generate errors when executed: **-enable_encexistingdata**, **-enable_rekey**, and **-key_lifespan**. When a LUN is added in DF-compatible encryption format, **-cleartext** is rejected as invalid.

-enable_encexistingdata | -disable_encexistingdata

Specifies whether or not existing data should be encrypted. The Encryption policy must be enabled on the LUN before the **-enable_encexistingdata** parameter can be set and the LUN state must be set to **-cleartext**. By default, encryption of existing data is disabled. If LUN policy is set to **-encrypt**, the encryption of existing data must be enabled, or existing data is not preserved. This policy is not valid for tape LUNs.

-enable_rekey time_period | -disable_rekey

Enables or disables the auto rekeying capability on the specified disk LUN. This operand is not valid for tape LUNs. By default, the automatic rekey feature is disabled. Enabling automatic rekeying is valid only if the LUN policy is set to **encrypt**. You must specify a *time_period* in days when enabling auto rekeying to indicate the interval at which automatic rekeying should take place.

-key_lifespan time_in_days | none

Specifies the lifespan of the encryption key in days. The key will expire after the specified number of days. Accepted values are integers from 1 to 2982616. The default value is **none**, which means, the key does not expire. This operand is valid only for tape LUNs. The key lifespan cannot be modified after it is set.

-newLUN

Indicates that the LUN created does not contain any user data and will be part of a replication configuration. This operand is optional. The presence of this operand is incompatible with the **-keyID**, **-key_lifespan**, and **-enable_rekey** options. An RSA RKM must be configured and replication must be enabled (cryptocfg --set replication enabled) before invoking this command. Both primary and remote mirror LUNs must be added to their container with the -newLUN option.

-write early ack disable | enable

Specifies the Tape Write pipelining mode of the LUN. This option enables or disables early acknowledgement of commands (internal buffering) for a tape LUN. This feature is enabled by default.

-read_ahead disable | enable

Specifies the Tape Read Ahead mode of the LUN. When Tape Read Ahead is disabled, the tape LUN operates in unbuffered mode. When Tape Read ahead is disabled, the tape LUN operates in buffered mode. This feature is enabled by default.

--modify -LUN

Modifies the encryption policies of one or more LUNs in a specified CTC. This command is valid only on the group leader. The following operands are required when modifying a LUN:

crypto_target_container_name

Specifies the name of the CTC to which the LUNs belong.

LUN_Num | range

Specifies the LUN number either as a 16-bit (2 bytes) number in hex notation (for example, 0x07) or as a 64-bit (8 bytes) number in WWN format (for example, 0:07:00:00:00:00:00:00). The LUN number must be zero when a tape LUN is specified and the tape drive is a single LUN device. When specifying a range, the LUN numbers must be entered in the 16-bit hex format.

initiator_PWWN initiator_NWWN

Specifies the initiator by its port WWN and node WWN.

You may optionally modify the following LUN policy configuration parameters. Refer to cryptocfg --add -LUN for descriptions of these parameters.

- [-encryption_format native | DF_compatible]
- [-encrypt | cleartext]
- [-enable_encexistingdata | -disable_encexistingdata]
- [-enablerekey time_period | -disable_rekey]
- [-write_early_ack disable | enable]
- [-read_ahead disable | enable]

Make sure you understand the ramifications of modifying LUN parameters (such as changing the LUN policy from encrypt to cleartext) for devices that are online and are already being utilized. The following restrictions apply when modifying LUN policy parameters:

- When you change LUN policy from encrypt to cleartext the following policy parameters are restored to default (disabled): -enable_encexistingdata, -enable_rekey, and -key_lifespan.
- When changing the LUN policy back to encrypt, these parameters need to be reconfigured. Attempting to reconfigure these parameters while the LUN policy is set to cleartext is not permitted and generates an error.
- For tape LUNs the **-enable encexistingdata** and the **-enable rekev** operands are not valid and return an error when executed.

- The -key_lifespan parameter cannot be modified for tape LUNs once it has been set.
- Exercise caution when modifying policy parameters while tape sessions are in progress. For information on the impact of encryption policy changes while tape sessions are in progress, refer to the Fabric OS Encryption Administrator's Guide.

--remove -LUN

Removes a LUN from a specified CTC. You must stop all traffic to the LUN from all initiators accessing the LUN you are removing from the CTC. Failure to do so results in I/O failure between the initiators and the LUN. If the LUN is exposed with different LUN Numbers to different initiators, all exposed LUN Numbers must be removed. This command is valid only on the group leader. The following operands are required when removing a LUN from a CTC:

crypto_target_container_name

Specifies the name of the CTC from which the LUN is to be removed.

LUN_Num

Specifies the number of the LUN to be removed. Use the **--show -container** command for a list of LUN numbers associated with the specified CTC.

initiator_PWWN

Specifies the initiator port WWN for the LUN to be removed.

--enable -LUN

Forces the LUN to become enabled for encryption from a disabled state. This command must be executed on the local switch that is hosting the LUN. No commit is required after executing this command. This command proceeds with a warning and prompts for confirmation.

A LUN may become disabled for various reasons, such as a change in policy from encrypted to cleartext, a conflict between LUN policy and LUN, or a missing DEK in the key vault. Force-enabling a LUN while metadata exist on the LUN may result in a loss of data and should be exercised with caution. Refer to the *Fabric OS Encryption Administrator's Guide* for a description of conditions under which a LUN may be disabled and recommendations for re-enabling the LUN while minimizing the risk of data loss.

The following operands are required when force-enabling a LUN:

crypto_target_container_name

Specifies the name of the CTC to which this LUN belongs.

LUN_Num

Specifies the number of the LUN to be enabled. Use the **--show -container** command for a list of LUN numbers associated with the specified CTC.

initiator_PWWN

Specifies the initiator port WWN for the specified LUN.

--create -tapepool

Creates a tape pool. A tape pool consists of a group of tape media that share the same encryption policies and data encryption keys (DEKs).

A maximum of 4096 tape pools per encryption group are supported. You may add up to a maximum of 25 tape pools per commit operation. There is a delay of five seconds delay at each commit operation.

Policy configuration at the tape pool level is optional; if left unspecified LUN-level tape policy parameters apply.

This command is valid only on the group leader. The following operands are supported:

-label pool_label | -num pool_num

Specifies the tape pool volume label or alternately the tape pool ID. This is a user-defined identifier, which must be unique within the encryption group and should match the tape pool label or ID that is configured on the tape backup application. The tape pool label can consist of any combination of characters. When using white space, you must enclose the tape pool label in double quotation marks. The maximum size is 64 bytes. This operand is required.

-encryption format

Optionally specifies the tape encryption format. Two encryption formats are supported for tape pools:

native

Data is encrypted or decrypted using the Brocade native encryption format (metadata format and algorithm). This is the default setting.

DF compatible

Data is encrypted or decrypted using the NetApp DataFort encryption format (metadata format and algorithm). Use of this format requires a NetApp DataFort-compatible license on the encryption switch or on the chassis that houses the encryption blade.

-encrypt | -cleartext

Enables encryption or cleartext (no encryption). By default, cleartext is enabled.

-key_lifespan time_in_days | none

Specifies the lifespan of the encryption key in days. The key expires after the specified number of days. The default value is **none**, which means the key does not expire until the value is set. This parameter cannot be modified for tape pools once it is set.

--delete -tapepool

Deletes the specified tape pool. This command is valid only on the group leader. The following operand is required:

-label pool_label | -num pool_num

Specifies the tape pool by volume label or tape pool ID. Use the --show -tapepool command for a listing of configured tape pools and their respective labels or IDs.

--modify -tapepool

Modifies the encryption policies of a specified tape pool. This command is valid only on the group leader. The following operand is required:

-label pool_label | -num pool_num

Specifies the tape pool by volume label or tape pool ID. Use the --show -tapepool command for a listing of configured tape pools and their respective labels or IDs. To modify the label or pool number, you must delete and recreate the tape pool.

You may optionally modify the following tape policy parameters.

- [-encryption_format native | DF_compatible]
- [-encrypt | cleartext]

Refer to **cryptocfg** --create -tapepool for descriptions of these parameters. Exercise caution when modifying tape pool policy parameters while tape sessions are in progress. Refer to the Fabric OS Encryption Administrator's Guide for more information.

--manual_rekey

Performs a manual rekeying of a specified LUN associated with a specified CTC. Manual rekeying is performed in both online and offline fashion depending on whether or not the host is online or host I/O is present. If any policy-based rekeying operation is currently in progress, this command aborts with a warning message. This command is valid only on the group leader.

The following operands are supported:

crypto_target_container_name

Specifies the name of the CTC to which this LUN belongs.

LUN Num

Specifies the number of the LUN to be rekeyed. Use the **--show -container** command for a list of LUN numbers associated with the specified CTC.

initiator_PWWN

Specifies the port WWN of the initiator for the specified LUN.

-include_mirror

Initiates a manual rekey on mirror LUN or on a primary LUN in read-only state. This operand is required if the specified LUN is mirror LUN or a primary that has been restored from an out-of-sync mirror LUN.

-all

Performs a manual rekey operation on all encrypted primary or nonreplicated LUNs on the node that are in read-write state. This operation may take an extended period of time.

-include_mirror

Initiates a manual rekey operation on all primary LUNs and mirror LUNs in read-only state. In addition, this command also starts a manual rekey operation on all primary and nonreplicated LUNs in read-write state.

--resume_rekey

Resumes a suspended rekey session for a specified disk LUN at the termination point. A rekey session may terminate prematurely due to unrecoverable medium or hardware errors. When a rekey session terminates prematurely, the system logs CRITICAL RASlog and rekey operation failure status messages. You must take corrective action to clear all error conditions that caused the rekey failure before resuming a suspended rekey session. All DEK or HA cluster members must be online and reachable for this operation to succeed.

crypto_target_container_name

Specifies the name of the CTC to which the LUN belongs.

LUN_Num

Specifies the number of the LUN to be rekeyed. Use the **--show -container** command for a list of LUN numbers associated with the specified CTC.

initiator PWWN

Specifies the initiator port WWN for the specified LUN.

--discoverLUN

Performs LUN discovery. This command discovers and displays all LUNs that are discoverable by the initiators of a specified CTC. This command is valid only on the node that hosts the CTC. The following operand is required:

crypto_target_container_name

Specifies the name of the CTC.

--show -container

Displays all CTCs in the encryption group. This command is valid on all nodes. The following operands are supported:

-all -cfg

Displays the configuration for all containers in the encryption group.

-all -stat

Displays the runtime status for all containers hosted on the local node only.

crypto_target_container_name

Displays information for the specified CryptoTarget container. If the **-stat** parameter is specified with this operand, the CTC must be hosted on the local node.

-cfg

Displays the configuration for the specified CTC.

-stat

Displays the runtime status for the specified CTC.

--show -tapepool

Displays configuration information for specified tape pools when used with the -cfg option. Displays runtime status information for specified tape pools when used with the -cfg option. This command is valid on all nodes. The following operands are supported:

-all -cfg

Displays configuration information for all configured tape pools in the encryption group.

-all -stat

Displays runtime status information for all configured tape pools in the encryption group.

-label pool_label | -num pool_num

Displays tape pool configuration or runtime status information for a single tape pool specified either by a tape pool label or a number. These operands must be used with either the -stat or the -cfg option.

-cfg | -stat

Displays either configuration information or runtime status for the specified tape pools.

--show -LUN

Displays Crypto LUN configuration or runtime status information for a specified CTC. This command is valid on all nodes. The following operands are supported:

crypto_target_container_name

Specifies the CTC for which to display the Crypto LUN information.

LUN_Num

Specifies the number of the LUN for which to display information.

initiator PWWN

Specifies the PWWN of the initiator.

-cfg | -stat

Displays either the configuration or the status of the specified Crypto LUN. The configuration can be displayed on any node in the encryption group. To display LUN status, the specified LUN must be hosted on the local node.

--show -rekey

Displays information about rekey sessions in progress. This command is valid on all nodes. The following operands are mutually exclusive:

-all

Lists all rekey sessions in progress on the current node.

crypto_target_container_name

Lists all rekey sessions in progress for a specified CryptoTarget container. You may further specify either one of the following operands:

LUN Num

Lists all rekey sessions in progress for a specific Crypto LUN of the specified CryptoTarget container.

initiator_PWWN

Lists all rekey sessions in progress for a specific initiator of the specified CryptoTarget container.

--show -tape_sessions

Displays runtime tape session information. This command is valid on all nodes. The following operands are mutually exclusive:

-all

Displays runtime information for all tape sessions in progress on the local node.

crypto_target_container_name

Displays runtime information for all tape sessions in progress for a specified CryptoTarget container.

--clearstats -container

Clears compressed or uncompressed blocks and/or byte counters for the specified containers. Specify one of the following operands:

-all

Clears blocks and/or byte counters for all CryptoTarget tape containers.

crypto_target_container_name

Clears blocks and/or byte counters for all CryptoLUNs of the specified CryptoTarget tape container.

--clearstats -LUN

Clears compressed or uncompressed blocks and/or byte counters for a specific CryptoLUN. The following operands are required:

crypto_target_container_name

Specifies the CryptoTarget tape container for the LUN.

LUN_Num

Specifies the number of the LUN to be cleared.

initiator_PWWN

Specifies the initiator port WWN for the specified LUN.

--refreshDEK

Rereads the mirror LUN metadata and updates the FPGA tables for the LUN if the keyID in the metadata has changed. You must issue this command on the node of the EE where the container that includes the mirror LUN is hosted. An RSA RKM must be configured for the encryption group and replication mode must be enabled for this command to succeed. This command fails if the specified LUN was not added with **-newLUN** option. The refresh operation may cause a brief disruption of the host I/O. The following operands are required:

crypto_target_container_name

Specifies the CryptoTarget container for the LUN.

LUN_Num

Specifies the number of the LUN whose metadata needs to be reread.

initiator PWWN

Specifies the initiator port WWN for the specified LUN.

--reclaimWWN

Reclaims the WWNs of the specified member node or encryption engine. This command removes the WWNs from the specified entity. Once removed you can reallocate the WWNs. The reclaim operation is disruptive and prompts for confirmation.

The following restrictions apply when you reallocate a WWN:

- The reclaim operations must be executed on the group leader node. All encryption engines must be online and the Group status must be "converged".
- All nodes in the encryption group must run Fabric OS v7.0.0 or later.
- You must commit all container changes prior to and following the reclaim operation.
- You must perform a reclaim operation for any node or encryption engine that needs to be moved out of an existing encryption group.

-membernode node_WWN

Specifies the node WWN of any member node in the encryption group. This command frees up all WWNs associated with all encryption engines in the specified member node. It also displays a list of containers that will be affected by the reclaim operation.

--EE node_WWN slot

Specifies the node WWN of any encryption engine in the encryption group. This command frees up all WWNs associated with the specified encryption engines for reallocation. You must specify a slot number in addition to the EE node WWN. To complete the reclaiming of an EE, you must remove the EE from the chassis after the reclaim operation and commit the transaction.

-list

Displays a listing of crypto-target containers affected by the reclaim operation. This operand is optional.

-cleanup

Removes all crypto configurations present on the member node after the WWNs have been reclaimed. This command must be executed on the ejected member node.

EXAMPLES

- 1. Create a zone that includes initiator and target.
 - a. Determine the device configuration.

```
FabricAdmin:switch> nsshow

```

b. Create and enable a zone named "itzone" that includes initiator and target.

```
FabricAdmin:switch> zonecreate itzone, \
"10:00:00:00:c9:2b:c9:3a; 20:0c:00:06:2b:0f:72:6d"

FabricAdmin:switch> cfgcreate itcfg, itzone

FabricAdmin:switch> cfgenable itcfg

You are about to enable a new zoning configuration.

This action will replace the old zoning configuration with the current configuration selected.

Do you want to enable 'itcfg' configuration \
(yes, y, no, n): [no] y

zone config "itcfg" is in effect

Updating flash ...
```

2. Create a disk CryptoTarget container to be hosted on the encryption engine.

3. Add an initiator to the CryptoTarget container and commit the transaction.

```
FabricAdmin:switch> cryptocfg --add -initiator my_disk_tgt \
10:00:00:00:c9:2b:c9:3a 20:00:00:c9:2b:c9:3a

Operation Succeeded
FabricAdmin:switch> cryptocfg --commit

Operation Succeeded
```

4. Display the CTC configuration.

```
Number of host(s): 1
Configuration status:committed
                   10:00:00:00:c9:2b:c9:3a \
   20:00:00:00:c9:2b:c9:3a
                    20:02:00:05:1e:41:4e:1d \
   20:03:00:05:1e:41:4e:1d
Number of LUN(s):
Operation Succeeded
```

5. Discover the LUNs seen by the initiators in the CryptoTarget container.

```
FabricAdmin:switch> cryptocfg --discoverLUN my_disk_tgt
Container name:
                    my_disk_tgt
Number of LUN(s):
                    1
                    10:00:00:00:c9:2b:c9:3a
Host:

To reclaim all WWNs associated with an encryption engine:

```
switch:admin> cryptocfg --reclaimWWN -EE 10:00:00:05:1e:39:b3:96 12
Warning: WWN reclaim operation may result in momentary IO disruption.
ARE YOU SURE (yes, y, no, n): [no] y
Operation succeeded.
Please use "cryptocfg --commit" to commit the configuration.
```

To attempt to reclaim all WWNs associated with a member node when containers are still present on the node:

```
switch:admin> cryptocfg --reclaimWWN -membernode 10:00:00:05:33:13:7a:e8
Warning: WWN reclaim operation may result in momentary IO disruption.
Make sure that the Membernodes are not hosting any container.
ARE YOU SURE (yes, y, no, n): [no] y
Operation failed: Reclaim WWN's is not allowed as the Membernode
still hosts containers. Please delete or move the containers.
```

To reclaim all WWNs associated with a member node when no containers are present on the node:

```
switch:admin> cryptocfg --reclaimWWN -membernode 10:00:00:05:33:13:7a:e8
Warning: WWN reclaim operation may result in momentary IO disruption.
Make sure that the Membernodes are not hosting any container.
ARE YOU SURE (yes, y, no, n): [no] y
Operation succeeded.
Please use "cryptocfg --commit" to commit the configuration.
Please eject the membernode from the EG "cryptocfg
   --eject -membernode 10:00:00:05:33:13:7a:e8".
Then deregister the membernode "cryptocfg --dereg
   -membernode 10:00:00:05:33:13:7a:e8".
On the membernode [10:00:00:05:33:13:7a:e8]
   execute "cryptocfg --reclaimWWN -cleanup".
```

To display the crypto-target containers affected by the reclaim operation:

To clean up the stale crypto configurations from the ejected member node.

```
switch:admin> cryptocfg --reclaimWWN -cleanup
Warning: There are stale (Container|HA|Tape) cryptodb \
    configurations. Please confirm to delete them.
ARE YOU SURE (yes, y, no, n): [no] y
Warning: These are the list of crypto configuration \
    files to be cleaned up:
Inside /etc/fabos/mace (crypto_dek.db.0, crypto_dev.db.0, \
    crypto_hac.db.0, crypto_pool.db.0, crypto_wwn.db.0).
ARE YOU SURE (yes, y, no, n): [yes] y
Operation Succeeded.
```

FUNCTION 5. Transaction management

SYNOPSIS cryptocfg --help transcfg

cryptocfg --commit [-force]

cryptocfg --transabort transaction_ID

cryptocfg --transshow

DESCRIPTION

Use these **cryptoCfg** commands to manage the transaction mechanism for those functions that require configuration changes to be committed before they take effect. These functions include "3. High Availability (HA) cluster configuration" and "4. Storage device configuration and management"

Transaction commands must be invoked on the group leader.

OPERANDS

The **cryptoCfg** transaction management function has the following operands:

--help transcfg

Displays the synopsis for the transaction management function.

--commit

Commits the transaction. This command saves the defined configuration to nonvolatile storage. Changes are persistent across reboots and power cycles. This command overwrites existing configuration parameters and therefore prompts for confirmation. This command is permitted only when the encryption group is in a converged state.

The following operand is optional:

-force

Commits the transaction without confirmation.

--transabort transaction ID

Aborts a pending database transaction for any device configurations invoked earlier through the CLI or DCFM interfaces. The following operand is required:

transaction ID

Specifies the ID of the transaction to be aborted. Use the --transshow command to determine the currently pending transaction ID.

--transshow

Displays the pending database transaction for any device configurations invoked earlier through the CLI or DCFM interfaces. The command displays the transaction status (completed or pending), the transaction ID, and the transaction owner (CLI or DCFM)

FUNCTION

6. Device decommissioning

SYNOPSIS

cryptocfg --help -decommission

cryptocfg --decommission -container container_name -initiator initiatator _PWWN -LUN LUN_num

cryptocfg --delete -decommissionedkeyids

cryptocfg --show -decommissionedkeyids

cryptocfg --show -vendorspecifickeyid key_ID

DESCRIPTION

Use these cryptoCfg commands to decommission a disk LUN in the event that the storage device is to be reprovisioned, retired, or returned to the vendor. The decommission function renders all data on the disk media inaccessible before decommissioning the device.

Device decommissioning deletes or renders invalid all important information including keys stored in the key vault, on the chip, and from the various internal caches, and it erases the metadata on the media to ensure that the data on the decommissioned device is irrecoverable.

The following restrictions apply to device decommissioning:

- Devices not encrypted on the Brocade Encryption platform or devices in cleartext cannot be decommissioned with this command.
- All nodes in the encryption group must run Fabric OS v6.4.0 or later.
- Device decommissioning does not work across a reboot. Rebooting terminates an ongoing decommissioning process and the command must be reissued after completing the reboot.

- Device decommissioning is supported only with the LKM and RKM key vaults.
- Decommissioning of tape devices or snap drive volumes is currently no supported.
- Decommissioning does not automatically delete the keys. You must manually delete the keys from the key vault to complete the operation.

OPERANDS

This command has the following operands:

--help -decommission

Displays the command usage help for the device decommissioning commands.

--decommission

Decommissions a disk LUN hosted in a specified container as seen from the initiator. You must issue this command from the node that hosts the container. Upon successful completion of a decommissioning operation, the LUN is deleted from all the containers hosting it. All active paths to the LUN are lost; there is no need to execute a decommissioning operation separately for each path associated with the LUN. A commit operation is not required. The following operands are required:

-container container_name

Specifies the name of the container that hosts the LUN.

-initiator initiatator_PWWN

Specifies the initiator port WWN.

-LUN LUN_num

Specifies the number of the LUN to be decommissioned.

--delete -decommissionedkeyids

Purges all key IDs associated with decommissioned LUNs from the internal cache. You must delete the keys manually from the key vaults before purging the cache.

--show -decommissionedkeyids

Displays the key IDs associated with decommissioned LUNs.

--show -vendorspecifickeyid key_ID

Displays the UUID for the specified key. This operand is valid only on the RKM key vault.

EXAMPLES

The following steps must be performed to decommission a disk LUN:

1. Execute the decommission operation on a LUN

```
switch:admin> cryptocfg --decommission -container disk_ct0 \
    -initiator 21:01:00:1b:32:29:5d:1c -LUN 0
Operation succeeded.
```

2. Display the key IDs to be deleted manually from the keyvault

```
switch:admin> cryptocfg --show -decommissionedkeyids
Please Delete these keyed from the vault:
76:a0:01:f2:34:6e:44:cc:35:e9:be:71:64:ca:5e:90
switch:admin> cryptocfg --show vendorspecifickeyid
aa:8b:91:b0:35:6f:da:92:8a:72:b3:97:92:1b:ca:b4
uuid = b7e07a6a-db64-40c2-883a-0bc6c4e923e6
```

- 3. Manually delete the keys from the vault. This step requires accessing the Key Vault GUI and deleting the keys manually.
- 4. Delete the key IDs from the internal cache.

```
switch:admin> cryptocfg --delete -decommissionedkeyids
operation succeeded
```

SEE ALSO None

dataTypeShow

Displays sample data stream types used in some diagnostic commands.

SYNOPSIS datatypeshow [-seed value]

DESCRIPTION Use this command to display sample data stream types used in diagnostic commands. There are 25

different sample data types. The command displays an example of each data stream.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

-seed value

Specify the data pattern seed value. This operand is optional. The default value is

EXAMPLES To display sample data streams you can use with diagnostics:

date

Displays or sets the switch date and time.

SYNOPSIS

date ["newdate"]

DESCRIPTION

Use this command to display or set the date and time. All switches maintain current date and time in flash memory. Date and time are used for logging events. Normal switch operation does not depend on the date and time; a switch with incorrect date values continues to function properly.

This command sets a common date and time for the entire fabric. A change in date or time to one switch is forwarded to the principal switch and distributed to the fabric. It may take up to 64 seconds for the switches in the fabric to be synchronized. However, if an FCS policy is enabled, this command can be executed only on the Primary FCS switch, and only the primary FCS switch can distribute the time stamp to all other switches in the fabric.

If Virtual Fabrics are enabled, the date is set for the entire chassis, including all logical switches.

The date specified is always the local switch time, taking into account daylight saving time and the time zone setup of the switch. Each switch takes care of converting the GMT time distributed fabric-wide to its local time. Refer to **tsTimeZone** for more information on time zone support.

If the switch is operating in FICON Management Server mode (**fmsMode**), setting the date is subject to the director clock alert mode (DCAM). If DCAM is 1, the operator issues a warning that the switch date is about to change. The operator then prompts to confirm the change with a ves or no response.

NOTES

This command becomes read-only if external NTP synchronization is enabled. For more information, refer to **tsClockServer**.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

"newdate"

Specify the new date and time enclosed in double quotation marks. this operand is optional; if omitted, the current date and time is displayed. Date and time are

specified as a string in the *mmddhhmmyy* format.

mm

Specifies the month. Valid values are 01 to 12.

dd

Specifies the date. Valid values are 01 to 31.

hh

Specifies the hour. Valid values are 00 to 23.

mm

Specifies the minutes. Valid values are 00 to 59.

уу

Specifies the year, valid values are 00 to 37 and 70 to 99. Year values from 70 to 99 are interpreted as 1970 to 1999; year values from 00 to 37 are interpreted as

2000 to 2037.

EXAMPLES To display the current date and time and then modify it:

switch:admin> date
Thu Mar 24 17:15:00 UTC 2011

switch:admin> date "03224182011"
Thu Mar 24 18:20:26 UTC 2011

SEE ALSO errShow, ficonCupSet, ficonCupShow, portLogShow, tsClockServer, tsTimeZone, upTime

dbgShow

Displays current values of debug and verbosity levels of the specified module.

SYNOPSIS dbgshow [module_name]

DESCRIPTION Use this command to display the current values of debug and verbosity levels of the specified module. If

no module name is specified, this command displays a listing of all modules along with debug and

verbosity levels.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

module_name

Specifies the name of the module for which you want to view the debug and verbosity levels. Module names are case-sensitive. This operand is optional.

EXAMPLES To display information about a specific module named NS:

switch:admin> dbgshow NS

Module NS, debug level = 1, verbose level = 1

SEE ALSO setDbg

defZone

Sets or displays the default zone access mode.

SYNOPSIS

defzone [--noaccess | --allaccess | --show]

DESCRIPTION

Use this command to display or set the Default Zone access mode. Setting the Default Zone mode initializes a zoning transaction (if one is not already in progress), and create reserved zoning objects.

A default zone controls device access when zoning is not enabled. When a user-specified zoning configuration is not enabled, Default Zone is in effect, allowing access to all devices. When a user-specified zone configuration is enabled, it overrides the Default Zone access mode.

NOTES

This command must be issued from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Zone object names beginning with the **d_efault_** prefix are reserved for default zoning use. Editing of these objects is not permitted. Therefore, **cfgShow** does not display the names of these objects.

If d_efault_Cfg is the effective zone configuration, both cfgShow and cfgActvShow do not display d_efault_Cfg as the effective zone configuration.

OPERANDS

This command has the following operands:

--noaccess

Sets the default zone access mode to No Access, initializes a zoning transaction (if one is not already in progress), and creates the reserved zoning objects equivalent to the following zoning commands:

- cfgCreate "d_efault_Cfg","d_efault_Zone"
- zoneCreate "d_efault_Zone","00:00:00:00:00:00:00:01"

A **cfgSave**, **cfgEnable**, or **cfgDisable** command must be issued after issuing this command to commit the changes and distribute them to the fabric; for example:

- defzone --noaccess
- cfgsave

An audit log record is generated for each execution of this command.

When No Access default zone is activated, the following conditions apply:

- If the current effective zone configuration is disabled with the cfgDisable command, the local switch converts this command to the equivalent of cfgEnable "d efault Cfg".
- If zoning receives a cfgDisable command from a remote switch that does not support default zoning, zoning rejects the cfgDisable command in the second phase of RCS because the remote switch does not convert the cfgDisable command to cfgEnable "d_efault_Cfg".

--allaccess

Sets the default zone access mode to All Access, initiates a zoning transaction (if one is not already in progress), and deletes the reserved zoning objects by performing the equivalent to the following zoning commands:

- cfgDelete "d_efault_Cfg"
- zoneDelete "d efault Zone"

A cfgSave, cfgEnable, or cfgDisable command must be performed subsequent to the use of this command to commit the changes and distribute them to the fabric. If a cfgSave is performed and the fabric is already in the No Access default zone state, a cfgDisable is sent to the fabric. For example:

- defzone --allaccess
- cfgsave

An audit log record is generated for each use of this command.

--show

Displays the current state of the default zone access mode.

EXAMPLES To create a default zone configuration:

```
primaryfcs:admin> cfgactvshow
     Effective configuration:
       No Effective configuration
primaryfcs:admin> defzone --noaccess
primaryfcs:admin> cfgsave
primaryfcs:admin> defzone --show
Default Zone Access Mode
committed - No Access
transaction - No Transaction
primaryfcs:admin> cfgactvshow
    Effective configuration:
       No Effective configuration: (No Access)
```

SEE ALSO None

diagClearError

Clears the diagnostics failure status.

SYNOPSIS diagclearerror [[--slot] slot] -all

DESCRIPTION Use this command to clear the diagnostics failure status. When used without operands, this command

clears all port failure flags.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

--slot slot

Specify the slot on which to clear the diagnostics failure status. The default is set

to 0 and designed to operate on fixed-port-count products.

-all

If specified, all blades clear.

EXAMPLES To clear the diag software flag:

switch:admin> diagclearerror --slot 8

ERROR: DIAG CLEARERR

Diagnostics Errors Cleared, port: 8/31

Err# 0120041 081F

SEE ALSO None

diagDisablePost

Disables the power-on self-test (POST).

SYNOPSIS diagdisablepost

DESCRIPTION Use this command to disable POST. A reboot is not required for this command to take effect. Use the

diagPost command to display the current POST status, and use diagEnablePost to enable POST.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To disable the POST:

switch:admin> diagdisablepost

Config update Succeeded

Diagnostic POST is now disabled.

SEE ALSO diagEnablePost, diagPost

diagEnablePost

Enables the power-on self-test (POST).

SYNOPSIS diagenablepost

DESCRIPTION Use this command to enable POST. A reboot is not required for this command to take effect. POST

includes two phases: POST Phase I mainly tests hardware and POST Phase II tests system functionality.

Use the diagPost command to display the current POST status, and use diagDisablePost to disable

POST.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To enable POST:

switch:admin> diagenablepost

Config update Succeeded

Diagnostic POST is now enabled.

SEE ALSO diagDisablePost, diagPost

diagHelp

Displays diagnostic command information.

SYNOPSIS

diaghelp

DESCRIPTION

Use this command to display a short description of diagnostic commands.

Use default operands when running diagnostics commands. Non-default settings require detailed knowledge of the underlying hardware and are intended for support personnel only. Contact support if

you want to use these operands.

NOTES

The diagHelp command displays diagnostic commands that may not be available. Execute help

command to verify availability.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS

None

EXAMPLES

To display diagnostic command information:

switch:admin> diaghelp

bpportloopbacktest Functional test of port via

blade processor path.

MBIST test for AP blade BP ASICs bpturboramtest Functional test of port N->N path. ceeportloopbacktest

MBIST test for ASICs ceeturboramtest

(output truncated)

SEE ALSO

None

diagPost

Displays the diagnostic power-on self-test (POST) configuration.

SYNOPSIS diagpost

DESCRIPTION Use this command to display the current POST configuration. Use **diagEnablePost** or **diagDisablePost**

to modify the POST configuration.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the current POST configuration:

switch:admin> diagpost

Diagnostic POST is currently disabled.

SEE ALSO None

diagRetry

Sets or displays diagnostic retry mode.

SYNOPSIS diagretry [mode | -show]

DESCRIPTION

Use this command to enable retry mode if the mode value is nonzero and to disable the retry mode if the mode value is 0. The mode value is saved in nonvolatile memory until you change the mode. Changes made by this command do not require a reboot to take effect.

Retry mode modifies the behavior of the diagnostic test methods, power-on self-test (POST), and burn-in scripts. The exact behavior depends on the tests and scripts that are run.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following optional operands:

mode

Specify 1 to enable retry mode. Specify 0 to disable the feature.

-show

Displays the current mode setting. The --show option is equivalent to using the command without operands.

EXAMPLES

To view and modify the current retry mode value:

```
switch:admin> diagretry -show
Diagnostic Retry Mode is currently enabled.
switch:admin> diagretry 0
Config update Succeeded
Diagnostic Retry Mode is now disabled.
switch:admin> diagretry 1
Config update Succeeded
```

Diagnostic Retry Mode is now enabled.

SEE ALSO None

diagShow

Displays diagnostics status.

SYNOPSIS diagshow

[--slot number] [-uports itemlist] [-bports itemlist] [-use_bports value]

DESCRIPTION

Use this command to display the diagnostics status for the specified list of blade or user ports.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details

OPERANDS

This command has the following optional operands:

--slot number

Specify which slot to operate on. If this option is not specified, the default slot 0 is used. The default slot is designed to operate on fixed-port-count products. By default, this command displays information for all user ports in the system.

-uports itemlist

Specify a list of user ports.

-bports itemlist

Specify a list of blade ports.

-use_bports value

If this value is nonzero, this command displays the diagnostics status for the blade ports specified in **-use_bports**; otherwise, the command displays information for the user ports specified in **-uports**. The default value is 0.

EXAMPLES

To display diagnostic status on a switch blade:

switch:admin> diagshow

Diagnostics Status: Fri Feb 08 15:25:24 2002

'S

SEE ALSO itemList

distribute

Distributes data to switches in a fabric.

SYNOPSIS

distribute -p policy list -d switch list

DESCRIPTION

Use this command to distribute data to a specified list of switches in the fabric. The distributed data must be from the list of currently supported policy sets:

SCC

Switch Connection Control Policy

DCC

Device Connection Control Policy

PWD

Password Database and Password Configuration Policy

AUTH

E_Port and F_Port Authentication Policy

FCS

Fabric Configuration Server Policy

Each supported database has a switch-local configuration parameter that controls whether the database can be distributed and accepts distributions. Use the **fddCfg** command to view and modify these parameters.

NOTES

IP Filter policies cannot be distributed with the **distribute** command. Use the **chassisDistribute** command.

The password database received from a switch running pre-v6.3.0 firmware will be rejected by a Virtual Fabric-enabled v6.3.0 chassis if it has more than one logical switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-p policy_list

Specify the list of policy sets, also called security databases, to be distributed. policy_list is a semicolon-separated list. Valid values include SCC, DCC, PWD, AUTH. and FCS.

-d switch list

Specify the list of switches that should receive the data distribution. The switch_list is a semicolon-separated list of one of the following:

- Switch domain IDs
- Switch names
- Switch WWNs

A wildcard (*) may be specified to include all switches in the fabric that support the **distribute** feature.

EXAMPLES

To distribute the Switch Connection Control Policy and Device Connection Control Policy to domains 3 and 5 in the fabric:

```
switch:admin> distribute -p "SCC;DCC" -d "3;5"
```

To distribute the Switch Connection Control Policy, Fabric Configuration Server Policy, and Password database to all domains in the fabric that support the **distribute** feature:

```
switch:admin> distribute -p "SCC;FCS;PWD" -d "*"
Wildcard domains are:
1 3 5
```

To distribute the FCS policy, and the Password database to all domains in the fabric that support the **distribute** feature:

```
switch:admin> distribute -p "FCS;PWD" -d "*"
```

To distribute the AUTH and FCS policies to all switches in the fabric that run Fabric OS v5.3.0 or later:

```
switch:admin> distribute -p "AUTH;FCS" -d "*"
```

To distribute the AUTH and SCC policies to domains 1 and 3 in the fabric:

```
switch:admin> distribute -p "AUTH;SCC" -d "1;3"
```

SEE ALSO fddCfg

dlsReset

Disables Dynamic Load Sharing (DLS).

SYNOPSIS

disreset

DESCRIPTION

Use this command to disable Dynamic Load Sharing.

If DLS is turned off, load sharing calculations are used only to place new routes. Once placed, existing routes are never moved from one output E_Port to another, unless the original output E_Port is no longer a recognized path to the remote domain. Optimal balance is rarely achieved with this setting. Refer to the disSet help page for a full description of load sharing options, including the Lossless feature.

The behavior of this command depends on the routing policies configured on the switch:

- If a port-based routing policy is in place, DLS is disabled by default, and dlsReset returns the DLS setting to default. If Lossless was enabled, this command removes the Lossless option along with the DLS feature and returns a message stating that "DLS is not set".
- If an exchange-based routing policy is in place, DLS is always enabled. It cannot be disabled and the disReset command fails. The command generates a message stating that "DLS cannot be changed with current routing policy". If Lossless is enabled, the feature remains enabled until you disable it with the dlsSet --disable -lossless command.
- If DLS is already disabled, the command output confirms the disabled status: "DLS is not set (unchanged)."

Refer to aptPolicy for information on routing policies.

NOTES

The Lossless feature is not supported on GbE ports and FCoE ports. On unsupported platforms, this command exits with an appropriate message.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

None

EXAMPLES

To disable the Dynamic Load Sharing option on a switch with a port-based routing policy and DLS enabled:

```
switch:admin> dlsreset
DLS is not set
```

To execute **dlsReset** on a switch with an exchange-based routing policy and DLS enabled:

```
switch:admin> dlsreset
DLS cannot be changed with current routing policy
```

aptPolicy, dlsSet, dlsShow

dlsSet

Enables Dynamic Load Sharing (DLS) without frame loss.

SYNOPSIS disset

disset --enable -lossless

dlsset --disable -lossless

disset --help

DESCRIPTION

Use this command to enable or disable Dynamic Load Sharing (DLS) in the event of a fabric change, to configure DLS without frame loss, and to display the DLS configuration.

Dynamic load sharing optimizes the utilization of the interswitch links (ISLs) by rebalancing the paths going over the ISLs whenever there is a fabric event that may result in a sub-optimal utilization of the ISL. Dynamic rebalancing can be triggered by any one of the following events:

- A change in the fabric occurs.
- A local E_Port (including trunk ports) goes up or down.
- A local Fx_Port goes down.

When used without operands, this command enables Dynamic Load Sharing on a switch (legacy DLS behavior). Frames may be lost during reroute operations. If the switch has an exchanged-based routing policy, DLS is enabled by default and this command fails with the following message: "DLS can not be changed with current routing policy."

During the load sharing recomputation, existing routes may be moved to maintain optimal load balance. Frame loss is unavoidable when a port goes down. To prevent frames from being lost during this operation, you can enable DLS without frame loss by issuing this command with the **--enable -lossless** option.

Dynamic load sharing without frame loss is supported in logical fabrics and is configured per logical switch. However, there is a potential impact on other logical switches because they share the same hardware. Chassis permissions are required to configure DLS in a logical fabric environment.

For example, assume a chassis is partitioned as follows: logical switch LS1 consists of ports 1/0-1/5, and logical switch LS2 consists of ports 1/6-1/10. Lossless is enabled on logical switch LS1. Because the ports 1/0-1/10 share the same chip, traffic in LS2 is affected whenever traffic for LS1 on ports 1/0-1/5 is rebalanced. The impact on LS2 depends on the configuration on LS2:

- If the Lossless feature is enabled on LS1, traffic pauses and resumes without frame loss on both switches at the same time.
- If the Lossless feature is disabled on LS1, traffic on LS2 is not affected.

NOTES

You cannot enable Lossless when XISL use is enabled, and you cannot enable XISL use while Lossless is enabled. In either case, the operation terminates with an appropriate error message. Use the **configure** command to disable XISL use.

Lossless is supported with both exchange-based and port-based routing policies. Behavior depends on the kind of policy configured and concurrent IOD settings. Refer to the *Fabric OS Administrator's Guide* for information on how to optimize your configuration. Refer to the **aptPolicy** help page for more information on routing policies.

The Lossless feature is not supported on GbE ports and FCoE. On unsupported platforms, this command exits with an appropriate message.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

--enable -lossless

Enables the Lossless feature. Frame loss is reduced while the path is rerouted. If DLS is set on the switch, this command adds the Lossless feature to the existing DLS legacy mode. If DLS is not set on the switch, this command enables both DLS and the Lossless feature. The Lossless feature is disabled by default.

--disable -lossless

Disables the previously enabled Lossless feature. Execution of this command is equivalent to the legacy dlsSet command. Dynamic load balancing is enforced but not without frame loss. DLS (legacy mode) continues to be enabled after Lossless is disabled. Use disReset to disable DLS completely.

--help

Displays the command usage.

EXAMPLES

DLS configuration commands on a switch with an exchange-based policy:

```
switch:admin> aptpolicy
Current Policy: 3 0(ap)
3 O(ap) : Default Policy
1: Port Based Routing Policy
 3: Exchange Based Routing Policy
        0: AP Shared Link Policy
        1: AP Dedicated Link Policy
switch:admin> dlsshow
DLS is set by default with current routing policy
DLS is set with Lossless enabled
switch:admin> dlsreset
DLS can not be changed with current routing policy
switch:admin> dlsset
DLS can not be changed with current routing policy
switch:admin> dlsset --enable -lossless
Lossless is set
switch:admin> dlsset --disable -lossless
Lossless is not set
switch:admin> dlssshow
DLS is set by default with current routing policy
```

DLS configuration commands on a switch with a port-based policy:

```
switch:admin> dlsshow
   DLS is set by default with current routing policy
   DLS is set with Lossless enabled
   switch:admin> dlsreset
   DLS is not set
   switch:admin> dlsshow
   DLS is not set
   switch:admin> dlsset --enable -lossless
   DLS and Lossless are set
   switch:admin> dlsshow
   DLS is set with Lossless enabled
   switch:admin> dlsset
   Lossless is set (unchanged)
   switch:admin> dlsset --disable -lossless
   Lossless is not set
   switch:admin> dlsshow
   DLS is not set
To attempt to enable Lossless while XISL use is enabled:
```

```
switch:admin> dlsset --enable -lossless
Lossless option cannot be enabled when XISL use is allowed.
Please disable the switch with 'switchdisable' and run \
 'configure' to disallow XISL use before enabling Lossless.
```

SEE ALSO aptPolicy, dlsReset, dlsShow, iodReset, iodSet, iodShow, uRouteShow, topologyShow

dlsShow

Displays the setting of the Dynamic Load Sharing (DLS) option.

SYNOPSIS

disshow

DESCRIPTION

Use this command to display information about Dynamic Load Sharing configuration settings on the switch. Depending on the configuration, the command output displays one of the following messages:

- DLS is set DLS is enabled without the Lossless feature. Load sharing is reconfigured with every
 change in the fabric, and existing routes can be moved to maintain optimal balance. No attempt is
 made to prevent frames from being lost while load sharing is recomputed.
- DLS is not set DLS is disabled. Existing routes are never moved to maintain optimal balance. If
 the Lossless option was enabled before you disabled DLS, it is now disabled as well. This means,
 frame loss is not prevented during a load sharing recomputation.
- DLS is set with Lossless enabled DLS is enabled with the Lossless feature. Load sharing is
 recomputed with every change in the fabric, and existing routes can be moved to maintain optimal
 balance. In Lossless mode, no framers are lost during this operation.
- DLS is set by default with current routing policy. DLS is set with Lossless enabled Indicates that the current routing policy (Exchange-based) requires DLS to be enabled by default. In addition, the Lossless option is enabled. Frame loss is prevented during a load sharing recomputation.

Refer to dlsSet for a description of load sharing.

NOTES

The Lossless feature is not supported on GbE ports and FCoE ports. On unsupported platforms, this command exits with an appropriate message.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the current DLS configuration on a switch with port-based routing. :

```
switch:admin> dlsshow
DLS is set with Lossless enabled.
```

SEE ALSO disSet, disReset

dnsConfig

Sets, displays, or removes domain name service (DNS) parameters.

SYNOPSIS dnsconfig

DESCRIPTION Use this command to display, set, or remove the domain name service parameters.

The domain name service parameters are the domain name and the name server IP address for primary and secondary name servers. The **dnsconfig** command displays IPv4 and IPv6 addresses.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To set the DNS parameters for the system:

```
switch:admin> dnsconfig
Enter option
1 Display Domain Name Service (DNS) configuration
2 Set DNS configuration
3 Remove DNS configuration
4 Quit
Select an item: (1..4) [4] 2
Enter Domain Name: [] domain.com
Enter Name Server IP address in dot notation: [] \
   123,123,123,123
Enter Name Server IP address in dot notation: [] \
   123.123.123.124
DNS parameters saved successfully
Enter option
1 Display Domain Name Service (DNS) configuration
2 Set DNS configuration
3 Remove DNS configuration
4 Ouit
Select an item: (1..4) [4] 4
```

SEE ALSO configDownload, configUpload, firmwareDownload, ipAddrSet, ipAddrShow

enclosureShow

Displays attributes of the switch enclosure.

SYNOPSIS enclosureshow attribute

DESCRIPTION Use this command to display attributes of the switch enclosure, including the vendor-specific enclosure

identifier and the identifier of the enclosure interface to which the switch is attached.

This command applies to products that are embedded in a blade server or storage chassis. Most options are platform-specific. Options that do not apply to a platform are identified with a "Not supported on this

platform" message.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

attribute

Specifies the enclosure attribute. Valid attributes include the following:

id

The vendor-specific enclosure identifier.

modelname

The vendor-specific enclosure model name.

slotid

The identifier of the enclosure interface to which the switch is attached.

rackname

The name assigned by the enclosure manager to the rack.

rackid

The serial number assigned by the enclosure manager to the rack.

enclosurename

The name assigned by the enclosure manager to the enclosure.

enclosureid

The serial number assigned by the enclosure manager to the enclosure.

connname

The product name used by the enclosure manager for the switch model.

connaddr

The connector address used by the enclosure manager for this switch (indicates

the physical position of the switch in the enclosure).

connid

The serial number of the switch used by the enclosure manager (not to be

confused with the Factory Serial Number).

conntype

The connector type used by the enclosure manager for this model of switch.

connloc

The switch location within the enclosure.

connpres

Information about the presence of the switch that is used by the enclosure

manager.

connfuse

Information about whether or not the switch has a fuse.

EXAMPLES To display the identifier of the enclosure interface to which the switch is attached:

 $\label{eq:switch} \mbox{switch:admin> enclosureShow slotid} \\ \mbox{Bay 4}$

SEE ALSO chassisShow

errClear

Clears all error log messages for all switch instances on this Control Processor (CP).

SYNOPSIS errclear

DESCRIPTION Use this command to clear all internal and external error log messages for all switch instances on the CP

> where the command is executed. For products with a single processor, all error log messages are cleared. For products that contain multiple processors, this command can be executed on either control processor. It clears the error log only on the CP where the command is executed. For example, to clear

the error log on the standby CP, issue errclear on the standby CP.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To clear the error log messages:

switch:admin> errclear

SEE ALSO errDump, errShow

errDelimiterSet

Sets the error log start and end delimiters for messages sent to the console and syslog.

SYNOPSIS errdelimiterset

[-s "start_delimiter_string"]
[-e "end_delimiter_string"]

DESCRIPTION

Use this command to set the error log start and end delimiters for log messages sent to the console and syslog. An empty string clears the start and the end delimiters (including the colon) so that they are not displayed.

When used without operands, this command displays the existing **errDelimiterSet** configuration. The delimiter configuration is stored persistently.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Start and end delimiters are displayed only at the console; they are not displayed in a Telnet session or in the RASLog.

OPERANDS

This command has the following operands:

-s "start_delimiter_string"

Specifies an alphanumeric string for the start delimiter. The string can be up to 10 characters long and must be enclosed in double quotation marks. This operand is optional.

-e "end_delimiter_string"

Specifies the alphanumeric string for the end delimiter. The string can be up to 10 characters long and must be enclosed in double quotation marks. This operand is optional.

EXAMPLES

To display the start and end delimiters:

```
switch:admin> errdelimiterset
delimiter start string: <none>
delimiter end string: <none>
```

To change the start and end delimiters (with sample output):

```
switch:admin> errdelimiterset -s "Start" -e "End"
switch:admin> errdelimiterset
delimiter start string: Start
delimiter end string: End
```

Sample output:

```
Start2003/03/10-09:54:03, [NS-1002], 1035,, ERROR, SWITCH43, Name Server received an invalid request from device 10:02:32:A3:78:23:23:End
```

SEE ALSO

errDump, errFilterSet, errShow

errDump

Displays the error log without pagination.

SYNOPSIS

errdump [-a | -r]

DESCRIPTION

Use this command to dump external error log messages without any page breaks. When executed without operands, this command prints all error messages for the logical switch context in which the command is executed. When used with the -a option, the command prints the error messages for the entire chassis. The messages are dumped to the console without page breaks. The -r operand displays the messages in reversed order.

The output of this command is unique for each control processor (CP). On dual CP systems this command must be executed on each CP to obtain a complete record.

The following information is displayed in each message:

Start delimiter

Delimiter string for the start of a message.

Timestamp

Timestamp for the message.

Message ID

Message identifier.

External sequence number

Sequence number for the message.

Security audit flag

Security audit message displayed as AUDIT.

Severity

Severity of the message. Valid values include INFO, WARNING, ERROR, and

CRITICAL.

Switch name

Switch name for the generator of this message, or "chassis".

Message

Message body.

End delimiter

Delimiter string for the end of a message.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-a

Displays messages for the entire chassis for a user with admin and chassis permissions. This operand is optional; if omitted, the messages for the current logical switch context are displayed.

-r

Displays messages in reversed order. This operand is optional; if omitted, the messages display in chronological order.

EXAMPLES To display the error log for the chassis:

```
switch:admin> errdump -a
Fabric OS: v7.0.0

2010/12/17-22:29:17, [SEC-1203], 9036, CHASSIS, INFO,\
    Spir_67, Login information : Login successful via \
    TELNET/SSH/RSH. IP Addr: 10.106.7.62

2010/12/17-22:29:17, [ZONE-1022], 9037, CHASSIS, INFO, \
    Spir_67, The effective configuration has changed to meh.

2010/12/17-22:29:17, [FABR-1001], 9041, CHASSIS, WARNING, \
    Spir_67, port 0, incompatible Long distance mode.

2010/12/17-22:29:17, [LOG-1000], 9043, CHASSIS, INFO, \
    Spir_67, Previous message repeated 1 time(s)
(output truncated)
```

SEE ALSO errDelimiterSet, errFilterSet, errShow

errFilterSet

Sets a filter for an error log destination.

SYNOPSIS errfilterset [-d destination][-v severity]

DESCRIPTION Use this command to set a filter for an error log destination. A filter is set based on the severity level of

the messages.

When used without operands, this command displays the filters that are currently in configured.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

-d destination

Specifies the destination for the filter. The string console is the only valid value at

this time.

-v severity

Specifies the minimum severity level of the message to pass through the filter.

Valid values are INFO, WARNING, ERROR, or CRITICAL. Input values are not

case-sensitive.

EXAMPLES To display the current filter settings:

switch:admin> errfilterset

console: filter severity = WARNING

To set the filter severity level for the console:

switch:admin> errfilterset -d console -v warning

SEE ALSO errDump, errShow

errModuleShow

Displays all the defined error log modules.

SYNOPSIS errmoduleshow

DESCRIPTION Use this command to display a list of all defined error log modules.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display a list of all defined error log modules:

switch:user> errmoduleshow

Module IDs:

(output truncated)								

SEE ALSO errDump, errShow

errShow

Displays the error log messages with pagination.

SYNOPSIS

errshow [-a | -r]

DESCRIPTION

Use this command to display external error log messages one at a time. When executed without operands, this command prints the error messages for the logical switch context in which the command is executed. When used with the -a option, the command prints the error messages for the entire chassis. The messages are displayed with page breaks. The -r operand displays the messages in reversed order.

The output of this command is unique for each Control Processor (CP). On dual CPs this command must be executed on each CP to obtain a complete record.

The following information displays in each message:

Start delimiter

Delimiter string for the start of a message.

Timestamp

Timestamp for the message.

Message ID

Message identifier.

External sequence number

Sequence number for the message

Security audit flag

Security audit message displayed as AUDIT.

Severity

Severity of the message. Valid values include INFO, WARNING, ERROR, and

CRITICAL.

Switch name

Switch name for the generator of this message, or "chassis".

Message

Message body.

End delimiter

Delimiter string for the end of a message.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-a

Displays messages for the entire chassis for a user with admin and chassis permissions. This operand is optional; if omitted, the messages for the current logical switch context are displayed.

-r

Displays messages in reversed order. This operand is optional; if omitted, the messages display in the chronological order.

EXAMPLES To display the error log for the chassis:

```
switch:admin> errshow -a
Fabric OS: v6.4.0

2010/08/25-10:10:41, [SEC-1203], 9036, CHASSIS, INFO, \

fabricLog

Displays (all users) or manipulates (admin) the fabric log.

SYNOPSIS fabriclog -s | --show [dport]

fabriclog -c | --clear [dport]

fabriclog -d | --disable

fabriclog -e | --enable

fabriclog -r size | --resize size

fabriclog -h | --help

DESCRIPTION

Use this command to display, clear, disable, enable, or resize the fabric log. When used with the **--show** option, this command displays the following information:

Time Stamp

Time of the event in the following format *HH:MM:SS:MS*.

Input and *Action

Fabric log message. An asterisk (*) in the message indicates an action.

S

Current switch state. Valid switch states include the following:

FO

Build Fabric (BF) received.

F1

Reconfigure Fabric (RCF) is not supported.

F2

Exchange Fabric Parameters (EFP) is waiting for last Accept Frame (ACC) from

flood.

F3

Flood EFPs.

D0

The switch is the principal switch.

D1

The principal switch is sending Domain ID Assigned (DIA).

D2

The principal switch is waiting for Request Domain ID (RDI).

D3

The principle switch is processing the RDI.

A0

The switch is not the principal switch.

Α1

The non-principal switch is sending a DIA.

A2

The non-principal switch is waiting for an RDI.

The non-Principal switch is processing an RDI. The switch is in offline state. Port state. Port states include the following: Po The port is offline. P1 The port is online. P2 Exchange Link Parameters (ELP) Accept Frame (ACC) received. P3 Link reset occurred on master or E_Port. 10 Trunk Initiator: Exchange Mark Timestamp (EMT) sent. 11 Trunk Initiator: Exchange Trunking Parameters (ETP) Accept Frame (ACC) received. 12 Trunk Initiator: ETP sent. 13 Trunk Initiator: Link reset occurred. 14 Trunk Initiator: Link reset done on slave. To Trunk Target: EMT received.
Port state. Port states include the following: PO The port is offline. P1 The port is online. P2 Exchange Link Parameters (ELP) Accept Frame (ACC) received. Port number, if applicable, or NA Xid
OXID (Exchange ID) Port number, if applicable, or NA
Refer to the FC-SW-5 specification for more information on the port and switch states logged by this

command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-s | --show [dport]

Displays the fabric log. Optionally displays the D_Port logs only.

-c | --clear [dport]

Clears the fabric log. Optionally clears the D_Port logs only.

-d | --disable

Disables the fabric log. By default, the fabric log is enabled.

-e | --enable

Enables the fabric log.

-r size | --resize size

Changes the maximum number of log entries. The specified size must be at least 2 and a power of 2; otherwise, the command fails.

-h | --help

Displays the command usage.

EXAMPLES To display the fabric log:

1 ,

```
switch:admin> fabriclog -s

(output truncated)
```

To change the size of the fabric log:

```
switch:admin> fabriclog -r 64 Warning: This command will clear the logs. Are you sure you want to do the resize [y/n]? y
```

To display the cleared fabric log after the size was changed:

SEE ALSO None

fabricName

Configures the fabric name parameter.

SYNOPSIS

fabricname --set fabric name

fabricname --clear

fabricname --show

fabricname --help

DESCRIPTION

Use this command to configure a name for the fabric.

With Virtual Fabrics it is not uncommon to have multiple fabrics in a single chassis. These logical fabrics are identified by their Fabric ID. With the fabricName command, you can address a fabric by name. This command provides an option for addressing fabrics by name. However, the fabric name does not replace the FID; the functionality of the FID is unaffected by the fabric name.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Fabric name support requires Fabric OS v7.0.0 firmware and will be lost on downgrade.

OPERANDS

This command has the following operands:

--set fabric_name

Sets the fabric name. The fabric name is a unique character string and can be up to 128 characters long. You can use any character including spaces and meta-characters. A fabric name that includes spaces must be included in double quotation marks. Tabs are not permitted. By default, the fabric name is not configured.

--clear

Clears the fabric name.

--show

Displays the fabric name. If a fabric name is not configured, an appropriate message is displayed.

--help

Displays the command usage.

EXAMPLES

To set and display the fabric name:

```
switch:user> fabricname --show
Fabric Name is not configured
switch:user> fabricname --set myfabric@1
Fabric Name set to "myfabric@1"
switch:user> fabricname --show
Fabric Name: "myfabric@1"
```

To set a fabric name that includes spaces:

```
switch:user> fabricname --set "my new fabric"
Fabric Name set to "my new fabric"
```

```
switch:user> fabricname --show
Fabric Name: "my new fabric"
```

To clear the fabric name:

switch:user> fabricname --clear
Fabric Name cleared!

switch:user> fabricname --show
Fabric Name is not configured

SEE ALSO switchShow, fabricShow

fabricPrincipal

Sets the principal switch selection mode.

SYNOPSIS

fabricprincipal --help | -h

fabricprincipal [--show | -q]

fabricprincipal --enable [-priority | -p priority] [-force | -f]

fabricprincipal --disable

fabricprincipal [-f] mode

DESCRIPTION

Use this command to set principal switch selection mode for a switch and to set priorities for principal switch selection.

The implementation of the fabricPrincipal command is based solely on mechanisms specified in the Fibre Channel standards. These mechanisms provide a preference for a switch requesting to be the principal switch in a fabric, but they do not provide an absolute guarantee that a switch requesting to be the principal switch is granted this status.

When dealing with large fabrics, the selection of the principal switch is less deterministic. In these cases, to help ensure that the desired switch is selected as the principal switch, a small cluster of switches should be interconnected first, followed by additional switches to enlarge the fabric.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

OPERANDS

This command has the following operands:

--help |-h

Displays the command usage.

--show

Displays the current mode setting and principal switch selection priority. This operand is optional; if not specified, fabricPrincipal displays the same data as with the --show option.

-q

Displays principal mode only (enabled or disabled). This is a legacy command option that does not display the priority settings.

--enable

Enables principal switch selection. The following operands are optional. If you do not provide a priority value, the system assigns the default of 0x01 or generates a value based on the switch state.

-priority | -p priority

Sets the principal selection priority of the switch. The specified priority value is used in the principal switch selection protocol when the fabric rebuilds. Not all of these values can be assigned.

0x00

Reserved. This value cannot be assigned.

0x01

Highest priority. This is a user-defined value

0x02

Switch was principal prior to sending or receiving a build fabric (BF) request. This value is generated by the switch to initiate a fabric reconfiguration. This value aboutd not be posigned.

value should not be assigned.

0x3 - 0xFE

Priority value range. Choose a value in this range to indicate priority. Higher

numbers mean lower priority.

0xFF

Switch is not capable of acting as a principal switch. This is a user-defined value. Use **--enable** with a new priority to revert to this condition.

-force | -f

Forces a fabric rebuild. This option is required when enabling principal switch mode. This option is not valid with the **--disable** command.

--disable

Disables principal switch selection. This command resets the priority to the default $% \left(1\right) =\left(1\right) \left(1\right) \left($

value 0xFE.

[-f] mode

Sets the principal switch mode. Specify 1 to enable principal switch mode. Specify 0 to disable principal switch mode. Optionally, use the **-f** operand to force a fabric rebuild. Mode changes take effect when the fabric rebuilds. This operand is optional.

EXAMPLES

To enable a high fabric principal priority setting:

```
switch:admin> fabricprincipal --enable -p 0xff -f
Principal Selection Mode enabled (Activate in \
  next fabric rebuild)
```

To disable the principal mode selection:

```
switch:admin> fabricprincipal --disable
Principal Selection Mode disabled
```

To display the current mode setting:

```
switch:admin> fabricprincipal -q
Principal Selection Mode: Enable
```

To disable the mode setting:

```
switch:admin> fabricprincipal 0
Principal Selection Mode disabled
```

To enable the mode setting:

```
switch:admin> fabricprincipal 1
Principal Selection Mode enabled
```

To enable the mode setting and force fabric rebuild:

```
switch:admin> fabricprincipal -f 1
Principal Selection Mode enabled \
    (Forcing fabric rebuild)
```

To display the principal switch selection priority:

switch:admin> fabricprincipal --show Principal Selection Mode: Enable Principal Switch Selection Priority: 0x10

SEE ALSO fabricShow

fabricShow

Displays fabric membership information.

SYNOPSIS fabricshow [-membership | -chassis]

fabricshow -help

DESCRIPTION Us

Use this command to display information about switches in the fabric.

If the switch is initializing or is disabled, the message "no fabric" is displayed.

Running this command on an FCR or edge switch does not provide any router information; running this command on an edge switch with the **-membership** option does provide router information.

If the fabric is reconfiguring, some or all switches may not be displayed; otherwise, the following fields are displayed depending on the command option used:

Switch ID

The switch Domain_ID and embedded port D_ID.

World Wide Name

The switch WWN.

Enet IP Addr

The switch Ethernet IP address for IPv4- and IPv6-configured switches. For IPv6

switches, only the static IP address displays.

FC IP Addr

The switch FC IP address.

Name

The switch symbolic name. An arrow (>) indicates the principal switch.

FC Router IP Addr

The IP address of the FC Router. This field is empty if the switch is not an FC

Router or it the FC Router does not support it.

FC Router Name

The FC Router symbolic name. This field is empty if the switch is not an FC

Router or it the FC Router does not support it.

Chassis WWN

The world wide name of the chassis. For switches running firmware versions that

do not distribute the chassis WWN, this field displays "NA".

Chassis Name

The name of the chassis. For switches running firmware versions that do not

distribute the chassis name, this field displays "NA".

Fabric Name

If the fabric has an assigned name, the fabric name is displayed at the end of the

command output.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-membership

Displays fabric membership information with additional details of the FC Router, if present in the fabric.

-chassis

Displays information about the chassis including chassis WWN and chassis name.

-help

Displays the command usage.

EXAMPLES

The following example illustrates a fabric of four switches. The switch named "sw180" is the Principal switch. Three of the switches are configured to run IP over Fibre Channel. The fabric name is configured.

switch:admin> fabricshow Switch ID Worldwide Name	Enet IP Addr FC IP Addr	Name					
64:fffc40 10:00:00:60:69:00:06:56 65:fffc41 10:00:00:60:69:00:02:0b							
66:fffc42 10:00:00:60:69:00:05:91 67:fffc43 10:00:00:60:69:10:60:1f		"sw60" "sw187"					
The Fabric has 4 switches Fabric Name: mainFabricA							

To show a mixed fabric with IPv4- and IPv6-configured switches (the fabric name is not configured):

To show additional details of the FC Router, if present:

switch:admin	> fabricshow -	membership	FC Router	FC Router
Switch ID	Name	ENET IP Addr	IP Addr	
1: fffc01 160: fffca0 190: fffcbe		10.33.59.224 0.0.0.0 10.33.59.32	10.33.59.25	fcr_meteor2

The Fabric has 3 switches

To show additional details about the chassis:

```
      switch:admin>
      fabricshow -chassis

      Switch ID
      Name
      ENET IP Addr Chassis WWN Chassis Name

      4:ffffc04 sw5100_126_128 10.38.17.126 10:00:00:05:1e:0e:eb:58 Brcd5100

      5:fffc05 sw1500_127_128 10.38.17.127 10:00:00:05:1e:0e:eb:98 Brcd5100
```

The Fabric has 2 switches

SEE ALSO fabricName, switchShow

fabStatsShow

Displays fabric statistics.

SYNOPSIS fabstatsshow

DESCRIPTION

Use this command to display statistics for the fabric. The following information is displayed:

- Number of times a switch domain ID has been forcibly changed
- Number of E_Port offline transitions
- Number of fabric reconfigurations
- Number of fabric segmentations resulting from any of the following causes:
 - Loopback
 - Incompatibility
 - Overlap
 - Zoning
 - E_Port segment
 - Licensing
 - Disabled E_Port
 - Platform DB
 - Security incompatibility
 - Security violation
 - ECP error
 - **Duplicate WWN**
 - E_Port isolated
 - Admin Domain header conflict
 - Virtual Fabric Admin Domain conflict
 - MSFR/RD H&T WWN conflict (internal only) Enhanced/Overlapping TI zones (ETIZ) Incompatibility
 - Exchange Switch Capabilities (ESC) detected conflict
 - Encryption conflict Both ends are not configured for encryption
 - Compression conflict Both ends are not configured for encryption
 - Encryp/Comp bw availability Encryption or compression Configured but lack of bandwidth in the ASIC

For each recorded incident, the command provides the following additional information:

Count

The total number of times the specific event occurred on various ports on the switch.

Port

The number of the port where the latest incident occurred. An arrow (<) next to the port number denotes the type of event that occurred last.

Timestamp

The time when the latest incident occurred.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display the fabric statistics:

switch:admin> fabstatsshow

SEE ALSO fabRetryShow

fanDisable

Disables a fan unit.

SYNOPSIS fandisable unit

DESCRIPTION Use this command to disable a nonfaulty fan unit by setting the RPM speed to 0.

NOTES This command is not available on nonbladed systems except for the Brocade 5300.

> The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

unit

Specifies the number of the fan unit to disable.

EXAMPLES To disable a fan unit:

switch:admin> fandisable 1

Fan unit 1 has been disabled

SEE ALSO fanEnable, fanShow

fanEnable

Enables a fan unit.

SYNOPSIS fanenable unit

DESCRIPTION Use this command to set a previously disabled fan unit back to the default RPM speed.

NOTES This command is not available on nonbladed systems except for the Brocade 5300.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

unit

Specify the fan unit number to enable.

EXAMPLES To enable a fan unit:

switch:admin> fanenable 1

Fan unit 1 has been enabled

SEE ALSO fanDisable, fanShow

fanShow

Displays fan status and speed.

SYNOPSIS fanshow

DESCRIPTION Use this command to display the current status and speed of each fan in the system.

Fan status is displayed as follows:

OK

Fan is functioning correctly.

absent

Fan is not present.

below minimum

Fan is present but rotating too slowly or stopped.

above minimum

Fan is rotating too quickly.

unknown

Unknown fan unit installed.

faulty

Fan has exceeded hardware tolerance and has stopped. In this case, the last

known fan speed is displayed.

The output from this command varies depending on switch type and number of fans present.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display information on the fans in the system:

switch:admin> fanshow Fan #1 is OK, speed is 2721 RPM Fan #2 is OK, speed is 2657 RPM Fan #3 is OK, speed is 2700 RPM

fapwwn --show -ag AG_WWN [-port]

fapwwn --help

DESCRIPTION

Use this command to create and manage fabric-assigned port world wide names (FA-PPWWNs) for Dynamic Fabric Provisioning (DFP). A FA-PWWN is a "virtual" port WWN that will bind to a device port and can be later assigned to a physical device. A FA-PWWN can be either user-generated or automatically assigned by the fabric. The automatically assigned FA-PWWN is created by default when you enable the feature without explicitly providing a VPWWN. With FA-PWWNs assigned to FC ports or Access Gateway (AG) ports, you can provision the ports in advance with zoning configurations, access control, or Ports on Demand assignments, and you can easily move servers across ports or Access Gateways by way of reassigning the FA-PWWN to another port.

The fapwwn command supports the following management tasks:

- Bind an automatically assigned or a user-assigned FA-PWWN to a switch port.
- Override an automatically assigned FA-PWWN with a user-assigned FA-PWWN.
- Bind an AG port with an automatically assigned or a user-assigned FA-PWWN.
- Delete any existing FA-PWWN bindings.
- Move a FA-PWWN from one port to another port.
- Move a FA-PWWN assigned to an AG port to another AG.
- Display information about configured FA-PWWN bindings.

A single port can be assigned up to two WWNs, one assigned automatically and one assigned by the user. Only one FA-PWWN can be active at any given time. The user-assigned FA-PWWN takes precedence over the automatically assigned FA-PWWN. This means, the switch will bind the user-assigned FA-PWWN to the port if both a user-assigned and an automatically assigned FA-PWWN are available.

FA-PWWN configurations are saved persistently and are preserved even if the feature is disabled on a port, or if you move the port to a different logical switch. The same configuration will be reapplied on the port once the feature is enabled or the port is moved back to the switch where you initially created and saved the configuration.

When issued for switch ports, the **--show** option displays the following information:

Port

Port number

PPWNN

Real PWWN of the device

VPWNN

Currently active FA-PWWN.

The following information is displayed for Access Gateway ports:

AG Port

Access Gateway node WWN followed by a slash and port number

Port

The FC switch port number

Device Port WWN

The real device port WWN displays only if the device is logged into the Access

Gateway.

Virtual Port WWN

The FA-PWWN (user-assigned or automatically assigned) created on the FC

switch for the Access Gateway port.

The following information is displayed for both AG and FC switch ports:

PID

Port ID.

Enable

Displays "yes" if the configuration is enabled; displays "No" if the configuration is

disabled.

MapType

Displays the type of mapping: Access Gateway (AG) or switch port (port).

user-assigned (user) or automatically assigned (auto).

NOTES

This command is supported only on the Brocade DCX, DCX-4S, DCX 8510-4, DCX 8510-8, and the and Brocade 6510. Regarding Access Gateway support, you cannot configure FA-PWWN on the Brocade 300, and 5100 when these switches are in Access Gateway mode. The AG port must be configured on the switch to which the AG is connected. However, both AG switches are FA-PWWN-aware, which means that they can connect to switches with configured FA-PWWN ports. Refer to the Brocade Adapters Administrator's Guide for list of supported Host Bus Adapters (HBAs) and configuration procedures. Refer to the Release Notes for other restrictions that may apply.

You cannot enable the FA-PWWN feature if **portSwap** is enabled on the ports.

The operands, --assign, --delete, --enable, and --disable can be executed only on a disabled port (switch ports and AG ports). You must re-enable the ports to come online with the new configuration. The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

this command has the following operands:

--enable

Enables the FA-PWWN feature on the specified switch ports or AG ports. If a FA-PWWN is not available for the ports, this command automatically assigners FA-PWWNs to the ports.

--disable

Disables the FA-PWWN feature on the specified switch ports or AG ports. This commands disables the binding of any existing FA-PWWNs to the specified ports, it does not delete the port configurations themselves. When you re-enable the feature, the persistently saved configurations are re-applied to the ports.

--assign

Assigns a FA-PWWN to a specified port. You can specify only a single port with this command (not a port range) and optionally provide a VPWWN. When executed without the -v option, this command automatically generates a FA-PWWN and assigns it to the port. When executed with the -v option, and a user-assigned FA-PWWN already exists, this command fails with an appropriate message. If an automatically assigned FA-PWWN exists, the user-generated FA-PWWN overrides the automatically generated FA-PWWN. When you assign a FA-PWWN to an AG port, you must specify the AG node WWN to uniquely identify the AG. The new FA-PWWN will take effect upon the next login session.

--delete

Deletes the active FA-PWWN from the specified ports. If a port is bound to a user-assigned FA-PWWN, this command deletes the currently active FA-PWWN and activates the automatically assigned FA-PWNN. If the active FA-PWWN is automatically assigned and no user-assigned FA-PWWN exists, this command deletes the FA-PWWN. When deleting VPWWNs from an AG, you must specify the AG node WWN and the **-port** operand is optional; if omitted, all active FA-PWWNs are deleted from the AG. To delete a single FA-PWWN, use the delete command with the **-v** option.

If no active FA-PWWNs exist on the ports, the FA-PWWN feature is disabled. Use the **-enable** command to re-enable the feature.

--show

Displays the FA-PWWN configuration for the specified ports or for all ports in the logical switch. When displaying information for AG ports, you must specify the AG node WWN.

-port[slot/]port[-port]

Specifies the ports to be configured or displayed on the switch or on the AG, preceded by a slot number on bladed systems. The port list can include a single port or a port range, for example, 3-5 or 1/3-5. Port ranges are supported only with automatically assigned FA-PWWNs, and only on switch ports. You cannot use a port range on AG ports.

-aq AG WWN

Specifies the Access Gateway node WWN.

-v VPWWN

Specifies a virtual PWWN to be assigned to the port. This operation deactivates any existing FA-PWWN on the port.

all

Specifies all ports on the logical switch. This operand is valid only with the --show option.

--move

Moves an active FA-PWWN from a source to the specified destination port. Use this command to move a server across switch ports. If the source port has both a user-assigned and an automatically assigned FA-PWWN, the user-assigned FA-PWWN will be moved to the destination port as a user-assigned FA-PWWN and replace any automatically assigned FA-PWWN that may be active on that port. If the source port has only an auto-assigned FA-PWWN, the auto-assigned FA-PWWN will be moved to the destination port and the FA-PWWN feature will be disabled on the source port, because there is no FA-PWWN left on that port. When moving PWWNs between Access Gateways, you must specify the source AG node WWN and the destination AG node WWN in addition to the ports.

The following operands are supported with the **--move** option:

-srcag AG_WWN

Specifies the source AG by its node WWN. This operand is required only when moving ports between Access Gateways.

-dstag AG_WWN

Specifies the destination AG by its node WWN. This operand is required only when moving ports between Access Gateways.

-srcport source port

Specifies the port from which to move the PWWN.

-dstport dest_port

Specifies the destination port for the moved PWWN.

--help

Displays the command usage.

EXAMPLES

To enable the FA-PWWN feature on a switch port:

```
switch:admin> fapwwn --enable -port 10
```

To disable the FA-PWWN feature on the switch port:

```
switch:admin> fapwwn --disable -port 10
```

To move the active FA-PWWN from a source port to another port:

```
switch:admin> fapwwn --move -srcport 2 -dstport 3
```

To move the active FA-PWWN from a source AG port to a destination AG port:

```
switch:admin> fapwwn --move -srcag 11:11:11:11:11:11:11:11
    -srcport 12 -dstag 22:22:22:22:22:22:22 -dstport 14
```

To assign a user-assigned FA-PWWN to a switch port:

```
fapwwn --assign -port 1/10 -v 50:60:70:71:72:73:81:81
```

To assign an automatically assigned FA-PWWN to a switch port:

```
fapwwn --assign -port 1/10
```

To assign a fabric-assigned FA-PWWN to an AG port identified by the AG node WWNN and port number:

```
fapwwn --assign -ag 12:34:56:78:90:12:23:45 -port 0
```

To assign an user-assigned FA-PWWN to an AG port:

```
fapwwn --assign -ag 12:34:56:78:90:12:23:45 -port 0 \
    -v 11:22:33:44:55:66:77:88
```

To delete the active FA-PWWN of a switch port:

```
fapwwn --delete -port 10
```

To delete the active FA-PWWN of an AG port:

```
fapwwn --delete -ag 12:34:56:78:90:12:34:56 -port 10
```

To display the active FA-PWWN for a single FC port (the real device PWWN is hidden):

```
fapwwn --show -port 10
```

Port	PPWWN	VPWWN	PID	Enable	МарТуре
10::	::: 52	:00:10:00:00:0f:50:45		Yes	Port/Auto

To display the active FA-PWWNs for all FC switch ports:

SEE ALSO None

fastBoot

Reboots the Control Processor (CP), bypassing the Power-On Self-Test (POST).

SYNOPSIS

fastboot

DESCRIPTION

Use this command to perform a "cold reboot" (power off/restart) of the CP bypassing POST when the system comes back up. Bypassing POST can reduce boot time significantly. If POST was previously disabled using the **diagDisablePost** command, then **fastBoot** is the same as **reBoot**.

The **fastBoot** operation is disruptive, and the command prompts for confirmation before executing. When you reboot a switch connected to a fabric, all traffic to and from that switch stops. All Fibre Channel ports on that switch including E_Ports become inactive until the switch comes back online.

The behavior of this command varies according to platform type:

- When issued on a standalone (single-processor) switch, this command performs a cold reboot of the switch.
- When issued on an enterprise-class platform (Brocade DCX, DCX-4S, or 48000) with two CPs (active and standby), the following rules apply:
 - When the Standby CP reboots, it goes down and there is no failover because there is no traffic
 on that switch. When the Standby CP comes up again, it is temporarily no longer in sync with
 the Active CP.
 - When the Active CP reboots, it fails over to the Standby CP. The Standby CP becomes the new Active CP and traffic is disrupted.
 - When HA is disabled and fastBoot is issued on the Active CP, both the Active and Standby CPs reboot with the original mastership retained. The original Active CP remains the Active CP after the reboot, and the original Standby CP remains the Standby CP. After the reboot, HA is enabled.
 - When HA is disabled and fastBoot is issued on the Standby CP, the Standby CP reboots
 without prompting. It boots up with the default switch only, even if the Active CP has multiple
 logical switches configured. After the Standby CP boots up, HA is still disabled.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

None

EXAMPLES

To reboot a standalone (single-processor) switch without executing POST on startup:

```
switch:admin> fastboot
```

```
Warning: This command would cause the switch to reboot and result in traffic disruption. Are you sure you want to reboot the switch [y/n]? y Broadcast message from root (pts/0) Sun Feb 28 19:49:45 2010... The system is going down for reboot NOW !!
```

To reboot a DCX without executing POST on startup (in the example, HA is enabled):

```
switch:admin> fastboot
Warning: This command is being run on a control processor (CP)
based system and will cause the active CP to reboot.
Are you sure you want to reboot the active CP [y/n]? {\bf y}
Broadcast message from root (pts/0) Sun Feb 28 19:49:45 2010...
The system is going down for reboot NOW !!
```

To reboot a DCX without executing POST on startup (in the example, HA is disabled):

```
switch:admin> fastboot
This command is being run on a control processor (CP)
based system. Because HA is disabled, it will cause both
active CP and the standby CP to reboot. After reboot, the
HA will be enabled.
Do you want to continue [y/n] y
Broadcast message from root (pts/0) Sun Feb 28 19:49:45 2010...
The system is going down for reboot NOW !!
```

SEE ALSO diagDisablePost, diagEnablePost, reBoot, haDisable, haEnable, haFailover

fcipChipTest

Tests functionality of components in the FCIP complex.

SYNOPSIS fcipchiptest

[--slot slot] [-testtype type] [-unit number]

DESCRIPTION

Use this command to verify the internal registers and memory of the network processor, FCIP FPGA, compression processor, and GigPHY.

NOTES

This command is supported only on the Brocade FR4-18i.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details

OPERANDS

This command has the following operands:

--slot slot

Specifies the slot number on which the diagnostic operates. The default is 0.

-testtype type

Specifies the test type to run. By default, the command runs all tests. Valid tests

include the following:

0

All tests

1

Network processor SRAM test

2

FCIP FPGA internal register test

3

FCIP FPGA interrupt test

4

FCIP FPGA checksum test

5

Compression engine MBIST and LBIST

-unit number

Specifies the GbE port to test. By default, all GbE ports in the specified slot are

used. Valid unit values include the following:

0

GbE port 0

1

GbE port 1

2

All GbE ports

DIAGNOSTICS

When a failure is detected, the test might report one or more of the following error messages:

CHIP_TEST_ERR

CHIP_TEST_CHIP_INIT_ERR

CHIP_TEST_IMAGE_VER_ERR CHIP_TEST_TIMEOUT_ERR CHIP_TEST_HEARBEAT_ERR CHIP_TEST_INVALID_RESULT

EXAMPLES To run all tests on slot 7 and GbE port 1:

switch:admin> fcipchiptest --slot 7 -unit 1 -testtype 0 Running fcipchiptest Test Complete: fcipchiptest Pass 1 of 1 $\,$ Duration 0 hr, 1 min & 15 sec (0:1:15:351).

SEE ALSO fcipPathTest

fcipHelp

Displays FCIP command information.

SYNOPSIS fciphelp

DESCRIPTION Use this command to display a listing of Fibre Channel over IP (FCIP) commands with short descriptions

for each command. FCIP commands require an FCIP license.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display FCIP command help information:

switch:admin> fciphelp

fastwritecfg Configure FC fastwrite feature (deprecated)
portcfg Create/Delete a new ip interface/route/arp

entry or fcip tunnel on the GigE port

portcmd Execute commands (ping etc) on the GigE port portshow Show configured ip interfaces/routes/arp

entries or fcip tunnels on the GigE Port

SEE ALSO portCfg, portCmd, portShow

fcipLedTest

Exercises the GbE port LEDS on the Brocade 7800 and FX8-24.

SYNOPSIS fcipledtest [slot | all]

DESCRIPTION Use this command to exercise the GbE port LEDs on the Brocade 7800 and FX8-24. This test cycles

through the port LEDs by lighting GREEN and then flashing GREEN on all ports for 3 seconds. As the test continues the ports turn AMBER and then flashing AMBER for 3 seconds. The LEDs turn off when

the test has finished.

You must disable the switch before running this command.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

slot

Tests all GbE ports in the specified slot. This operand is optional; if omitted, all

GbE ports are tested. This operand is valid only on chassis-based platforms.

all

Tests all ports on the switch.

EXAMPLES To test the LEDs on slot 4 of Brocade DCX with an FX8-24 blade.

switch:admin> fcipledtest 4

PASSED.

SEE ALSO ceePortLedTest, portLedTest, switchDisable, switchEnable

fcipPathTest

Tests the data path of the FCIP complex.

SYNOPSIS fcippathtest

[--slot slot]
[-lb_mode mode]
[-nframes count]

fcippathtest

[--slot slot]
[-unit number]
[-path mode]
[-nframes count]
[-length data_length]
[-compress mode]

DESCRIPTION

Use this command to verify the data paths in the FCIP complex. All data path modes run tests by comparing Fibre Channel frames or data packets transmitted from and received by the network processor due to the designated loopback.

This command is supported only on the Brocade 7800/FX8-24 and FR4-18i platforms. The command syntax is platform-specific and not all options are valid on all platforms. To specify the loopback mode on the Brocade FR4-18i, use the **-path** option. To specify the loopback mode on the Brocade 7800/FX8-24, use the **-lb_mode** option. Both options are mutually exclusive.

When issued on the Brocade 7800 or FX8-24, this command causes the switch or blade to reboot.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--slot slot

Specifies the slot number on which the diagnostic operates. The default is 0 and operates on fixed-port-count products (Brocade 7800/FX8-24).

-unit number

Specifies the GbE port to test (Brocade FR4-18i only). By default, all GbE ports in the specified slot are tested. Valid *number* values include the following:

0

GbE port 0

1

GbE port 1

2

All GbE ports

-lb_mode mode

Specifies the loopback mode for the test on the Brocade 7800/FX8-24 only. By default, this test uses the External (SERDES) loopback (2). Valid values are as follows:

1

Port loopback (loopback plugs)

2 External (SERDES) loopback 7 Backend bypass and port loopback -path mode Specifies the loopback mode for the test on the Brocade FR4-18i only. By default, fcipPathTest uses the PHY and central ASIC loopback modes. You can specify one of the following alternate loopback modes: 1 SFP loopback 2 PHY loopback 3 FCIP FPGA GMAC loopback FCIP FPGA FC loopback 5 Central ASIC FC loopback 7 SFP and central ASIC FC loopback 8 PHY and central ASIC FC loopback 9 FCIP FPGA GMAC and central ASIC FC loopback -nframes count Specifies the number of frames to send. The test progresses until the specified number of frames is transmitted on each port. The default value is 100 (Brocade FR4-18i and Brocade 7800/FX8-24). -length data_length Specifies the data length of the frames used in the test (Brocade FR4-18i only). The default is 1,024; the maximum is 2,112 FC frames and 8,196 data packets. -compress mode Specifies the compression device for which to select or to bypass data compression for the test (Brocade FR4-18i only). By default, data compression is used. This setting is applicable only to path mode 1 and 2. When it detects failures, the test may report one or more of the following error messages: PATH_TEST_ERR PATH_TEST_CHIP_INIT_ERR PATH_TEST_IMAGE_ERR PATH_TEST_TIMEOUT_ERR PATH_TEST_HEARTBEAT_ERR

DIAGNOSTICS

PATH_TEST_INVALID_RESULT

PATH_TEST_GE_PORT_ENABLE_ERR PATH_TEST_GE_PORT_DISABLE_ERR

EXAMPLES To run the test on slot 2 with PHY loopback sending 10 frames:

```
switch:admin> fcippathtest --slot 2 -path 2 -nframes 10
Running fcippathtest ......
Test Complete: fcippathtest Pass 10 of 10
Duration 0 hr, 1 min & 50 sec (0:1:50:942).
  passed.
```

SEE ALSO fcipChipTest

fcoe

Manages and displays FCoE configuration.

SYNOPSIS fcoe --cfqshow [[slot/]port]

fcoe --portcfg [[s/ot/]port] ve_port | vf_port

fcoe --disable [slot/]port

fcoe --enable [slot/]port

fcoe --loginshow [[slot/]port]

fcoe --fcmapset -vlan vid fcmapid

fcoe --fcmapunset -vlan vid

fcoe --fipcfq -advintvl intvl

fcoe --fipcfgshow

fcoe --resetlogin [-teport [slot/]port | -device wwn]

fcoe --help

DESCRIPTION

Use this command to configure and display the status of FCoE ports, FCoE Initialization Protocol (FIP), and FCMAP settings.

Unlike regular FC ports, FCoE ports are embedded interfaces that are not directly associated with an external physical port on the switch. Although show commands such as switchShow display FCoE ports as "ports," configuration of these ports through the regular FC CLI is disabled. Only the FCoE CLI commands can be used.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands.

slot

Specifies the slot number on bladed systems, followed by a slash (/).

port

Specifies the port number. There are 24 configurable embedded FCoE ports on the Brocade 8000 switch, and the valid range for port is 8 to 31. On the Brocade FCoE 10-24 blade, there are 24 configurable FCoE ports numbered 0 to 23. Use

switchShow for a list of valid FCoE ports.

--help

Displays the command usage.

--cfgshow

Displays the configuration of a specified embedded FCoE port. If a port is not

specified, the command displays all port configurations.

--disable

Disables the specified FCoE port.

--enable

Enables the specified FCoE port.

--loginshow

Displays information about the devices logged in to the specified FCoE port.

--fcmapset

Configures the FCMAP values for Fabric Provided MAC Addresses (FPMA) for

the specified VLANs.

-vlan vid

Specifies the VLAN for which to set the FCMAP.

fcmapid

Specifies the FCMAP to be set.

--fcmapunset

Unsets the FCMAP for a specified VLAN. Devices previously logged in are

disconnected.

-vlan vid

Specifies the VLAN ID for which the FCMAP is unset.

--fipcfg

Configures FIP multicast advertisement intervals.

-advintvl intvl

Specifies the interval in seconds. The minimum interval value is 0 and the maximum value is 90. A value of 0 cancels the previous advertisement interval

value. A value of 1 to 90 is valid for changing the interval.

--fipcfgshow

Displays FIP configurations.

--resetlogin

Clears the logins that occurred through a front end port or from a device specified

by the Enode's VN_Port WWN.

-teport [slot/]port

Specifies the slot or port number.

-device wwn

Specifies the device WWN.

EXAMPLES To display the FCoE ports on the Brocade 8000:

fcoeLoginCfg

Manages or displays the FCoE login configuration.

SYNOPSIS

fcoelogincfg --show

[-switch swwn | -logingroup | Igname]

[-saved] | [-mergestatus]

fcoelogincfg --save

fcoelogincfg --transshow

fcoelogincfg --transabort

fcoelogincfg --purge -conflicting [-nonexisting]

fcoelogincfg --purge -nonexisting [-conflicting]

fcoelogincfg --enable

fcoelogincfg --disable

fcoelogincfg --help

DESCRIPTION

Use this command to save, abort, or display the current FCoE login configuration, including ongoing transactions and the effective (saved) configuration.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The FCoE Login management feature is not supported in Access Gateway mode.

OPERANDS

This command has the following operands.

--help

Displays the command usage.

--show

Displays the state of the FCoE login configuration including current transactions and effective (saved) configuration.

-switch swwn

Displays the login groups for the specified switch.

-logingroup Igname

Displays the login group configuration for the specified login group.

-saved

Displays only the effective configuration.

-mergestatus

Displays the status of the last configuration merge during the last fabric merge. This operand also displays conflicting login groups and login groups for nonexisting switches.

--save

Saves and applies FCoE login configuration changes as the effective

configuration fabric-wide.

--transshow

Displays the current configuration transaction in progress fabric-wide.

--transabort

Aborts the FCoE login configuration transaction currently in progress.

--purge

Purges the specified entries from the effective configuration. Specify one or both

of the following operands:

-conflicting

Purges all conflicting login groups and conflicting VN_Port mappings from the

effective configuration.

-nonexisting

Purges all login groups for nonexisting switches from the effective configuration.

--enable

Enables the FCoE login configuration management on the switch. This allows only

configured Enode VN_Ports to log in. Use the fcoeLoginGroup command to

configure allowed Enode VN Ports.

--disable

Disables the FCoE login configuration management on the switch. This allows

unrestricted login on Enode V_Ports.

EXAMPLES To configure a login group and save the configuration:

```
switch:admin> fcoelogingroup --create login_def_allowall
    -self -allowall
```

```
switch:admin> fcoelogincfg --save
```

To display the saved configuration:

```
switch:admin> fcoelogincfg --show
```

No ongoing transaction

Effective Configuration

Login Configuration

Switch WWN Login group

10:00:00:05:1e:76:5c:80 login_def_allowall(active)

To display the current FCoE login configuration for the switch only:

```
switch:admin> fcoelogincfg --show -switch \
10:00:00:05:1e:76:5c:80
```

No ongoing transaction

Effective Configuration

Logingroup name : login_def_allowall(active)

Switch wwn : 10:00:00:05:1e:76:5c:80

All devices are allowed

To perform a clean-up of the effective configuration:

```
switch:admin> fcoelogincfg --purge -conflicting \
    -nonexisting
switch:admin>
```

To disable the FCoE login configuration management on the switch:

```
switch:admin> fcoelogincfg --disable
switch:admin> fcoelogincfg --show
Login management is disabled.
Effective Configuration
******
Login management is disabled.
```

SEE ALSO fcoeLoginGroup

fcoeLoginGroup

Creates and manages FCoE login group configuration.

SYNOPSIS

fcoelogingroup --create Igname

-self | -switch swwn [-allowall | member[:member] ...]

fcoelogingroup --delete Igname

fcoelogingroup --add | Igname member[;member] ...

fcoelogingroup --remove Igname wwn

fcoelogingroup --rename Igname newIgname

fcoelogingroup --help

DESCRIPTION

Use this command to create or modify the FCoE login management configuration fabric-wide. You can create or delete a login group, add Virtual N_Port (VN_Port) WWNs to a login group, or remove VN_Port WWNs from a login group.

NOTES

The configuration changes effected by this command are kept in a transaction buffer until you save the new configuration with the fabric-wide **fcoelogincfg** --save command.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands.

--help

Displays the command usage.

--create

Creates a login group with the specified name and associates it with a specified

switch.

Igname

Specifies the name of the login group for this switch. The maximum length is a

64-byte string.

-self

Specifies the WWN of the current switch. When this operand is specified, the login

group is associated with the current switch.

-switch swwn

Specifies the WWN of the switch for which to create the login group.

-allowall

Allows all VN_Port devices to log in to the switch.

member

Identifies the WWN of the VN_Port. The WWN must be specified in hex format as xx.xx.xx.xx.xx.xx.xx.xx.xx. If more than one member is specified, members must be separated by a semicolon. Only specified members are allowed to log in to the

switch.

--delete

Deletes a login group.

Igname

Specifies the name of the login group.

--add

Adds VN_Port devices to the login group.

Igname

Specifies the name of the login group to which VN_Port devices are to be added.

member

Identifies the WWN of the VN_Port. The WWN must be specified in hex as xx.xx.xx.xx.xx.xx.xx.xx.xx. If more than one member is specified, members must be separated by a semicolon. Only specified members are allowed to log in to the

switch.

--remove

Removes VN_Port devices from the login group.

Igname

Specifies the name of the login group from which VN_Port devices are to be

removed.

wwn

Identifies the WWN of the VN_Port. The WWN must be specified in hex format as xx.xx.xx.xx.xx.xx.xx.xx. Only specified members are allowed to log in to the switch.

--rename

Renames the specified login group. The following operands are required:

Igname

Specifies the current name of the login group.

newlgname

Specifies the new name for the login group.

EXAMPLES To create a login group:

```
switch:admin> fcoelogingroup --create mylg \
-self"12:23:34:45:56:67:78:89"
```

To add a VN_Port device to the login group:

```
switch:admin> fcoelogingroup --add \
mylg "12:00:00:00:00:00:1e:34"
```

To remove a VN_Port device from the login group:

```
switch:admin> fcoelogingroup --remove \
   mylg "12:00:00:00:00:1e:34"
```

To delete a login group:

```
switch:admin>fcoelogingroup --delete mylg
```

fcPing

Sends a Fibre Channel Extended Link Service (ELS) Echo request to a pair of ports or to a single destination, or executes a SuperPing.

SYNOPSIS f

fcping

[--number frames]
[--length size]
[--interval wait]
[--pattern pattern]
[--bypasszone]
[--quiet]
[source] destination

fcping --allpaths
[-printisl]
[-maxtries M]
[-covcount N]
[-delay D]
[-framelength len]
destination

fcping --help

DESCRIPTION

Use this command to send a Fibre Channel ELS Echo request to a pair of ports (a source and a destination), to a single device, or to execute a SuperPing that exercises all interswitch links (ISLs) and internal links in different paths that route to the destination device.

- When you use fcPing with a source and a destination, the command performs a zoning check between the two ports. In addition, two Fibre Channel ELS requests are generated. The first ELS request is from the domain controller to the source port identifier. The second ELS request is from the domain controller to the destination port identifier. The ELS Echo request elicits an ELS Echo response from a port identifier in the fabric and is useful for validating link connectivity.
 - The source and destination port identifiers can be specified as a 24-bit Fibre Channel port identifier (PISD), a port World Wide Name, or a node World Wide Name. The two port identifiers are then used to determine if the identifiers are zoned together.
- When you use fcPing to probe a single destination, an ELS Echo is sent to the specified destination
 and a response obtained. The destination can be a switch WWN, a domain ID, or a switch domain
 controller ID. No zoning check is performed when a single device is probed.
- When you use fcPing with the --allpaths option, the command exercises a "SuperPing." A SuperPing exercises all ISLs and the internal links included in the paths that route to the destination. It collects statistical data of all the covered paths and their port and provides optional parameters to selectively display the data. SuperPing takes only one argument, that is, the destination port identifier. To execute a SuperPing for two destination, you must issue the fcping --allpaths command separately for each destination.

SuperPing facilitates troubleshooting of links that experience problems. When an echo frame is dropped, all the ISLs and internal links potentially traversed by this frame are marked as failures. If a fabric topology is considered fully redundant, that is, at each hop there are multiple paths to reach a destination, a high percentage of errors are recorded on the link that experiences errors.

Logical Fabrics: When executed in a Logical Fabric from a switch to a destination device connected through the base fabric, SuperPing exercises all paths in the base fabric along with the ISLs in the logical fabric. The path output indicates the LISLs and the base switch. Refer to the Examples section for an illustration.

NOTES

The ELS Echo may not be supported on all devices. In such cases, the response could be either an ELS reject or a request timeout.

By default, fcPing sends five ELS Echo requests to each port. When a device does not respond to the ELS Echo request, further debugging may be needed to determine, whether the device does not support ELS Echo, or whether the request is rejected for some other reason. Do not assume that the device is not connected.

The execution of SuperPing requires that all switches in the fabric run Fabric OS v6.4.0 or later. For switches running earlier versions of Fabric OS, the collected data is incomplete.

If a fabric reconfiguration occurs while SuperPing is in progress, the command reports an error message. Exit the command and rerun the test after the fabric becomes stable again.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

destination

Specifies the destination as follows.

- When using fcPing between a source and a destination, specify the destination as port WWN or a node WWN.
- When using fcPing to ping a single device, specify the destination as a PID, a switch WWN, a domain ID, or a switch domain controller ID.
- When using fcPing with the --allpaths option, specify the destination as a PID, a switch WWN, or a domain ID.

source

Specifies the source port ID, port WWN, or node WWN. This operand is optional; it is not valid with the SuperPing command (--allpaths).

The following operands are valid only when fcPing is executed without the --allpaths option (legacy mode):

--number frames

Specifies the number of ELS Echo requests to send. The default value is 5.

--length size

Specifies the frame size of the requests in bytes. The default value is 0. Without data, the Fibre Channel Echo request frame size is 12 bytes. The total byte count includes four bytes from the Echo request header and eight bytes from the timestamp. The maximum allowed value is 2,036 bytes. The length must be word-aligned.

--interval wait

Specifies the interval, in seconds, between successive ELS Echo requests. The default value is 0 seconds.

--pattern pattern

Specifies up to 16 "pad" bytes, which are used to fill out the request frame payload sent. This is useful for diagnosing data-dependent problems in the fabric link. The pattern bytes are specified as hexadecimal characters. For example, --pattern ff fills the request frame with instances of the number 1. If a non-byte-aligned pattern is specified, the upper nibble of the last pattern byte is filled with zeros. For example, --pattern 123 fills the payload with a pattern of 0x1203.

--bypasszone

Bypasses the zone check.

--quiet

Suppresses the diagnostic output. Only zoning information, if applicable, and the summary line are displayed.

The following operands are valid only when **fcPing** is executed to perform a SuperPing:

--allpaths [args] destination

Executes a SuperPing that covers all available paths to the specified destination. The number of actual paths covered depends on two other parameters that you can optionally specify. When you issue **fcping** --allpaths for a destination without any other options, SuperPing covers all ISLs in the routes between source to destination but does exercise all possible combinations of end-to-end paths. This operand is required when executing **fcPing** as SuperPing.

The following operands are optional and valid only with the **--allpaths** option:

-printisl

Displays statistical data for each ISL and internal port along the paths traversed by SuperPing. This information displays in addition to the path display.

-covcount N

Specifies the minimum number of times each ISL is exercised by the SuperPing command. The command sends N frames and checks if each ISL is exercised at least N times. When the condition is met, superPing exits and prints the statistics. The default value is 5.

-maxtries M

Specifies the maximum number of frames to be sent before SuperPing exits. If both **-maxtries** and **-covcount** are specified, SuperPing checks the ISL coverage and keeps resending framers until the minimum coverage condition to is met or until the maximum number of echo frames specified in **maxtries** has been sent. For example, assuming a coverage count of 100 and a **Maxtries** value of 300, SuperPing will send 100 frames at a time and checks if each ISL is covered at least 100 times. If not, SuperPing will keep sending 100 frames at a time to check for coverage up to 3 times for a maximum of 300 frames (3*100 = 300) on each egress port. If this value is set too low in relation to the specified coverage count, not all ISLs may be covered. The default value is 100.

-delay D

Includes a delay of D milliseconds between each echo frame sent.

-framelength len

Specifies the size of the data to send.

--help

Displays the command usage.

EXAMPLES

To display one device that accepts the request and another device that rejects the request:

switch:admin> fcping 10:00:00:00:c9:29:0e:c4 21:00:00:20:37:25:ad:05

```
Source: 10:00:00:00:c9:29:0e:c4

Destination: 21:00:00:20:37:25:ad:05

Zone Check: Not Zoned

SEE ALSO None

fcpLogClear

Clears the FCPD debug information log.

SYNOPSIS fcplogclear

DESCRIPTION Use this command to clear the debug information logged by the Fibre Channel Protocol daemon (FCPD).

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To clear the FCPD debug information log:

switch:admin> fcplogclear

SEE ALSO fcpLogDisable, fcpLogEnable, fcpLogShow

fcpLogDisable

Disables the FCPD debug information log.

SYNOPSIS fcplogdisable

DESCRIPTION Use this command to disable the logging of debug information by the Fibre Channel Protocol daemon

(FCPD).

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To disable the FCPD debug information log:

switch:admin> fcplogdisable

SEE ALSO fcpLogClear, fcpLogEnable, fcpLogShow

fcpLogEnable

Enables the FCPD debug information log.

SYNOPSIS fcplogenable

Use this command to enable Fibre Channel Protocol daemon (FCPD) logging. Debug information **DESCRIPTION**

logging is enabled by default.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

fcpProbeShow

Displays the Fibre Channel Protocol (FCP) probe information.

SYNOPSIS fcpprobeshow [slot/]port

DESCRIPTION

Use this command to display the Fibre Channel Protocol daemon (FCPD) device probing information for the devices attached to the specified F_Port or FL_Port. This information includes the number of successful logins and SCSI INQUIRY commands sent over this port and a list of the attached devices.

For switches running Fabric OS v7.0.0 or later, this command includes probing information for NPIV devices. In addition, this command displays the list of devices connected to a port and the number of successful PLOGI, PRLI, INQUIRies, and current probe state.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to display, followed by a slash (/).

port

Specify the port number to display, relative to its slot for bladed systems. Use switchShow to list valid ports. This operand is required.

EXAMPLES

To display the FCP probe information:

```
switch:admin> fcpprobeshow 31
```

```
port 0 is FV-Port and it is online.
nodes probed:
           3

SEE ALSO portLoginShow, portLogShow

fcpRIsShow

Displays the Fibre Channel Protocol (FCP) Read Link Status (RLS) information.

SYNOPSIS

fcprlsshow [slot/]port

DESCRIPTION

Use this command to display the FCP RLS information for an F_Port or FL_Port. This information describes the number of loss-of-signal, loss-of-sync, CRC errors, and other failure events detected on the specified port.

For this command to gather and display F_Port error statistics, you must enable the following two configuration parameters:

- Disable Device Probing = 0 (Enables device probing)
- Disable RLS Probing = off (Enables RLS probing)

Device probing and RLS probing are disabled by default. Use the **configure** command to enable these parameters.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to display, followed

by a slash (/).

port

Specifies the port number to display, relative to its slot for bladed systems. Use **switchShow** for a listing of valid ports. This operand is required.

EXAMPLES

To display the FCP RLS information:

switch:admin> fcprlsshow 2/5

link	fail	loss sync	loss sig	prtc err	bad word cro	err
0xda	0	5	0	0	525	0
0xdc	0	3	0	0	330	0

fcrBcastConfig

Displays or sets the broadcast frame forwarding option.

SYNOPSIS fcrbcastconfig --show

fcrbcastconfig --enable -f fabric id

fcrbcastconfig --disable -f fabric_id

fcrbcastconfig --help

DESCRIPTION

Use this command to enable or disable the broadcast frame option or to display the current configuration. If no operands are specified, this command displays the usage. By default, frame forward option is disabled. Use the **--show** option to display the current settings on the switch.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--show

Shows the current broadcast configuration as enabled or disabled. If broadcast frame forwarding is disabled for selected FIDs, only the enabled FIDs in the current configuration are displayed.

--enable

Enables the frame forwarding option for a specified fabric ID.

--disable

Disables the frame forwarding option for a specified fabric ID

-f fabric_id

Specifies the fabric ID to be disabled or enabled. Valid values are 1 to 128. This operand is required with the --enable and --disable options.

--help

Displays the command usage.

EXAMPLES

To display the current configuration:

```
fcr:admin> fcrbcastconfig --show
Broadcast configuration is disabled for all FID
```

To enable broadcast frame forwarding for FID 33, 28, and 2:

```
fcr:admin> fcrbcastconfig --enable -f 33
fcr:admin> fcrbcastconfig --enable -f 28
fcr:admin> fcrbcastconfig --enable -f 2
```

To display the new configuration:

```
fcr:admin> fcrbcastconfig --show
Broadcast configuration is enabled for FID:
2 33 128
```

To disable broadcast frame forwarding for FID 33:

```
fcr:admin> fcrbcastconfig --disable -f 33
```

To display the new configuration:

switch:admin> fcrbcastconfig --show
Broadcast configuration is enabled for FID:
2 128

SEE ALSO bcastShow, portRouteShow

fcrChipTest

Tests the functionality of FC Router FPGA.

SYNOPSIS

fcrchiptest

[--slot slot] [-unit number] [-testtype type]

DESCRIPTION

Use this command to test the FC Router Field-programmable gate array (FPGA). This test verifies that all SRAM and register data bits in each ASIC can be independently written and read successfully.

The method used is to write a walking 1 pattern to each location. This is accomplished by writing a pattern of 0x00000001 to register N, performing a direct memory access (DMA) read, and ensuring that the same pattern previously written is read back. Shift the pattern to the left by 1 bit (to 0x00000002). repeat the write, read, and compare the cycle. Shift again and repeat until the last writable bit in register N is reached (0x80000000 for a 32-bit register).

For example, a 6-bit register is effectively tested with the following patterns:

```
0x0001 0x0002 0x0004 0x0008
    0x0010 0x0020 0x0040 0x0080
    0x0100 0x0200 0x0400 0x0800
    0x1000 0x2000 0x4000 0x8000
```

Repeat the steps until all FPGA registers are tested.

The built-in self test (BIST) runs to verify the static random access memory (SRAM) of the FPGAs.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only on the Brocade FR4-18i.

OPERANDS

This command has the following operands:

--slot slot

Specifies the slot number on which the diagnostic operates. The default is 0.

-testtype type

Specifies the test type to run. By default, the command runs all tests. Valid tests

include the following:

0

All tests

1

DMA test

2

SRAM BIST test

-unit number

Specifies the FC Router FPGA to test. By default, all FC Router FPGA in the

specified slot are used. Valid number values include the following:

0

FC Router FPGA 0

FC Router FPGA 1

2

All FC Router FPGAs

DIAGNOSTICS When a

When a failure is detected, the test might report one or more of the following:

DMA_ALLOC_FAIL

DMA_READ_ABORT

DMA_READ_TIMEOUT

CHIP_INIT_TIMEOUT

BIST_TIMEOUT

DIOT EAU

BIST_FAIL

EXAMPLES To run all tests on slot 7 and FC Router FPGA 1:

```
switch:admin> fcrchiptest --slot 7 -unit 1 -testtype 0
Running fcrchiptest ......
Test Complete: fcrchiptest Pass 1 of 1
Duration 0 hr, 0 min & 4 sec (0:0:4:351).
  passed
```

SEE ALSO fcrPathTest, portLoopbackTest

fcrConfigure

Sets FC Router configuration parameters.

SYNOPSIS fcrconfigure

DESCRIPTION Use this command to configure FC Router parameters. This is an interactive command.

Before you can execute this command, you must disable FC routing by using the fosConfig command

and disable the switch with the switchDisable command.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command interactively prompts for the following parameter:

Backbone Fabric ID

A fabric ID uniquely identifies a fabric in FC Router configurations. The backbone fabric is the fabric attached to the U_Ports of the switch, for example, E_Ports or F_Ports. The backbone fabric ID must be unique across all fabrics connected to the FC Router. Use the switchShow command to display the current Backbone

Fabric ID.

EXAMPLES To configure FC Router parameters:

fcr:admin> fcrconfigure

FC Router parameter set. <cr>> to skip a parameter Please make sure new Backbone Fabric ID does \

not conflict with any configured EX-Port's Fabric ID

Backbone fabric ID: (1-128)[128]

SEE ALSO fosConfig, switchDisable, switchEnable, switchShow

fcrEdgeShow

Displays the FIDs of all configured EX_Ports.

SYNOPSIS

fcredgeshow

fcredgeshow [-fid FabricID]

fcredgeshow --help

DESCRIPTION

Use this command without operand to display information about all Fabric IDs (FIDs) that have been created on the chassis and are assigned to EX_Ports.

When a FID is specified, **fcredgeshow** displays information for all EX_Ports configured with the specified FID.

For each FID, the command output includes the following:

FID

Fabric ID of the EX_Port.

EX-port

EX_Port number of the switch.

E_Port

Port number for the remote E_Port.

PWWN

Neighbor switch port WWN.

SWWN

Neighbor switch WWN.

The command output depends on the EX_Port configuration:

- If the EX_Port is online, the command displays the FID, the EX_Port to which it is assigned, the E_Port, the port WWN and the switch WWN.
- If the EX_Port is offline, the command displays the FID, the EX_Port to which it is assigned, and an "OFFLINE" message.
- IF no EX_Ports are configured in the switch, the command displays "No EX-port Configured".
- If no EX_Ports are configured within the specified FID, the command displays the following message: "No EX-ports with FID FabricID."

OPERANDS

This command has the following operands:

-fid FabricID

Specifies the FID for which to display the configured EX_Ports.

--help

Displays the command usage.

EXAMPLES

To display the EX_Ports configured in the switch:

To display the EX_Ports configured with a specified FID:

```
switch:admin> fcredgeshow -fid 25
FID EX-port E-port Neighbor Switch (PWWN, SWWN )
25 11 244 20:f4:00:05:le:38:a4:cb 10:00:00:05:le:38:a4:cb
```

To display a FID for which no EX_Ports are configured:

```
switch:admin> fcredgeshow -fid 29
No EX-ports with FID 29
```

SEE ALSO fcrPhyDevShow, fcrProxyDevShow, fcrRouteShow, IsanZoneShow, switchShow, fcrFabricShow

fcrFabricShow

Displays the FC Routers on a backbone fabric.

SYNOPSIS fcrfabricshow

DESCRIPTION

Use this command to display information about FC Routers that exist in an FC Router backbone fabric. The existing syntax is maintained for IPv6 support. When IPv6 addresses are not configured, the output of **fcrFabricShow** displays the IPv4 format.

The message "No active FC Routers found" is displayed if no active FC Routers are present on the backbone fabric.

The following information is displayed for each FC Router found on the backbone fabric:

WWN

The world wide name of the FC Router.

Domain ID

The domain ID of the FC Router. This domain ID is relevant only on the backbone

fabric.

Info

The Ethernet IP address and switch name of the FC Router. When IPv6

addresses are configured, only the static IP address displays for each FC Router

found on the backbone fabric.

EX_Ports

A listing of active EX_Ports for the FC Router and information about these

EX_Ports. This information includes:

EX Port

The port number for the EX_Port. An asterisk (*) at the end of the line indicates

that the EX_Port is a Remote Router Port.

FID

The fabric ID of the EX_Port.

Neighbor Switch Info (WWN, enet IP, name)

The WWN, Ethernet IP address, and switch name of the switch attached to the

EX_Port.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the FC Routers in the backbone fabric:

```
switch:admin> fcrfabricshow
```

```
FC Router WWN: 10:00:00:05:1e:41:59:81, Dom ID: 2, Info: 10.33.36.8, "swd77"

```

SEE ALSO fcrPhyDevShow, fcrProxyDevShow, fcrRouteShow, IsanZoneShow, switchShow

fcrLsan

Configures and displays LSAN policies.

SYNOPSIS

fcrlsan

fcrlsan --add -enforce tag | -speed tag

fcrlsan --remove -enforce tag | -speed tag

fcrlsan --show -enforce | -speed | all

fcrlsan --help

DESCRIPTION

Use this command to add or remove LSAN tags, or to display existing tags in the configuration. LSAN tagging optimizes an FC Router's behavior based on a specified subset of LSANS. This feature improves scalability and performance related to LSAN zone size and the speed with which they are imported or exported.

This command supports two types of LSAN tags: enforced tags and speed tags.

- Enforced LSAN tags filter zones accepted by the FC Router from the edge fabric by matching the
 zones to the configured tags. Only matching zones are accepted into the local database for export
 and import. For example, if you configure an enforced LSAN tag "BRCD" on a router, only zones
 with names starting with "Isan_BRCD" are accepted. If multiple tags are configured, any matching
 zones are accepted. A maximum of eight LSAN enforce tags are configurable per FC Router switch.
- A speed tag is a flag to indicate to the FCR that the targets in the LSANs matching the tag need to
 be imported permanently when host and target are zoned together, even if the host is not present.
 This mechanism facilitates a speedy discovery process by reducing instances of failure related to
 timeouts. Once the devices that belong to the target edge fabric are defined as speed LSANS, the
 import or export can occur with a minimum amount of delay when hosts reboot or are added to the
 zone database.

The following restrictions apply when configuring LSAN tags:

- The FC router must run Fabric OS v6.2.0 or later.
- The switch must be disabled when you configure enforce tags. Speed tags can be configured while the switch is online.
- You must change the LSAN name in the edge fabric or the backbone fabric and propagate the LSAN to the FCR. Note that enforce tags are not supported in the backbone fabric.
- The speed tags must be set in all related FC Routers in order for import and export to proceed correctly. However, only LSANs on the target edge fabric must append the tag.

When executed without operands, fcrlSan displays the command usage.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--add

Adds the specified tag to the LSAN tag configuration.

--remove

Removes the specified tag from the LSAN tag configuration.

--show

Displays the specified tag from the LSAN tag configuration.

--help

Displays the command usage.

-enforce tag

Accepts only the LSANs from the edge fabric that matches the specified tag string into the local FCR database. A valid tag is a string of a maximum of eight

characters. The maximum configurable enforced tags is eight.

-speed tag

Allows the FCR to always import these target devices to the hosts specified in the LSANs that match the speed tag. Only one speed tag is allowed per FC router.

-all

When used with the --show option, this command displays all LSAN tags in the

FCR LSAN tag database.

EXAMPLES To add an LSAN enforcement tag named "brocade":

```
switch:admin> switchdisable
switch:admin> fcrlsan --add -enforce brocade
LSAN tag set successfully
```

To add a speed tag named "mcdt":

```
switch:admin> fcrlsan --add -speed mcdt
LSAN tag set successfully
```

To remove the LSAN enforcement tag "brocade":

```
switch:admin> fcrlsan --remove -enforce brocade
LSAN tag removed successfully
```

To remove the speed tag "mcdt":

```
switch:admin> fcrlsan --remove -speed mcdt
LSAN tag removed successfully
```

To display the information from the cache:

```
switch:admin> fcrlsan --show -enforce
Total LSAN tags : 2
ENFORCE : brocade
ENFORCE : cisco
switch:admin> fcrlsan --show -speed
Total LSAN tags : 1
SPEED: mcdt
switch:admin> fcrlsan --show -all
Total LSAN tags : 3
ENFORCE : brocade
ENFORCE : cisco
SPEED: mcdt
```

SEE ALSO fcrFabricShow, IsanZoneShow, fcrPhyDevShow, fcrProxyDevShow, fcrRouteShow, switchShow

fcrLsanCount

Displays or sets the maximum LSAN count.

SYNOPSIS fcrisancount [max_lsan_count]

DESCRIPTION

Use this command to set or display the maximum number of LSAN zones that can be configured on the edge fabric. By default, the maximum LSAN count is set to 3000, which is also the minimum. This command allows you to create up to 5000 LSANs on your edge fabric, if needed to support additional devices. The maximum number of supported LSAN devices is 10,000.

When executed without operand, this command displays the current LSAN zone limit.

This command assumes that all FCRs in the same LSAN fabric matrix or backbone have the same maximum LSAN count defined in order to protect the FCRs from running into indefinite state. Asymmetric LSAN configurations due to different maximum LSAN counts may lead to different devices being imported on different FCRs.

Because the maximum number of LSANs is configured per switch, if there is a different maximum LSAN count on the switches throughout the meta-SAN, the device import or export will not be identical on the FCRs. You should therefore enter the same maximum LSAN count for all the FCR switches in the same backbone that support this feature. Verify the configured maximum limit against the LSANs configured using the **fcrResourceShow** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

max_lsan_count

Specifies the maximum LSAN count.

EXAMPLES

To display the current LSAN limit:

switch:admin> fcrlsancount
LSAN Zone Limit: 3000

To increase the LSAN zone limit:

switch:admin> fcrlsancount 5000

LSAN Zone Limit: 5000

fcrlsanmatrix --help

DESCRIPTION

Use this command to create, modify, remove, and manage Logical SAN (LSAN) Zone bindings between edge fabrics or between FC routers. LSAN Zone bindings specify pairs of edge fabrics or FCRs that can access each other and share LSAN Zone and device database information.

This command follows a transaction model. Modifications to the LSAN fabric matrix or to the FC router matrix are saved nonpersistently in a cache until you save the changes persistently with the --apply option.

When used with the **-Isan** option, this command manages the LSAN matrix information. An LSAN fabric pair binds two edge fabrics specified by their Fabric IDs. Every paired edge fabric implies two-way communications. The paired edge fabrics have access only to the edge fabrics associated with them by this command. The edge fabrics that are not specified in the LSAN fabric matrix have access to the remaining unspecified edge fabrics. Using this information, the FCR switch maintains the remote LSAN Zone and the device state database only if it is associated with its local edge fabrics.

For example, if the edge fabrics with FIDs 1, 2, 3, 4, and 5 are online, all edge fabrics have two-way communication. This is the default behavior. If you pair the edge fabrics 1 and 2 with the --add -lsan command, the default access between the edge fabrics is changed as follows:

- Fabric 1 can access only fabric 2.
- Fabric 2 can access only fabric 1.
- The fabrics 3, 4, and 5 can access each other, but cannot access Fabric 1 or 2.

The LSAN matrix information is automatically distributed to all switches in the fabric. The FIDs entered are not required to be online when you set up the LSAN fabric matrix.

When used with the -fcr option, this command manages the FC router matrix. This database consists of FC router pairs that can talk to each other. All edge fabrics connected to a defined pair of FCRs are allowed to import devices to each other.

Once a fabric is removed from an FCR, the communication with other fabrics of the two FCRs is also removed. It is advisable to update the matrix to reflect the change. If FCR Binding is enabled in the edge fabrics, the edge fabrics can still communicate with the backbone fabric. The LSAN matrix provides a higher level of granularity than the FCR matrix. Therefore, communication between two fabrics could pass the FCR matrix, but fail due to restriction of the FID matrix.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

If no operands are specified, this command displays the persistent LSAN Zone matrix information. The following operands are optional:

--add -Isan FID FID | -fcr wwn wwn

Adds the pair of edge fabrics or FCR members that can access each other to the LSAN matrix cache. Edge fabrics are specified by their Fabric IDs. FCRs are specified by their world wide names (WWNs). If the FCR is online, the domain ID of the switch can be used in place of the WWN. If you specify **--add** with zero (0) value for *FID* or 00:00:00:00:00:00:00:00 for *wwn*, the command returns the cache to default mode.

--remove -Isan FID FID | -fcr wwn wwn

Removes the specified pair of FIDs or FCRs from the cache. When you remove a fabric or FCR pair from the LSAN matrix, the edge fabrics assume the default behavior.

--apply -lsan | -fcr | -all

Applies the information from the cache to persistent memory. This operation succeeds only if there is no effect on the existing import/export devices. Otherwise, this command generates an error message. See the Diagnostics section for more information.

--cancel -Isan | -fcr

Cancels changes made to the cache that were not applied. This command effectively reverts to the persistently stored information.

--display -lsan | -fcr | -all

Displays the information saved in the cache.

--fabricview -lsan | -fcr

Displays all static and default/dynamic fabric bindings in the backbone.

--verify -Isan | -fcr

Verifies if the LSAN Zone information previously entered and stored in the cache can be successfully applied. The data is considered acceptable if the apply operation does not cause any traffic disruption

--quickmode

Derives the LSAN Zone matrix from the imported or exported devices.

DIAGNOSTICS Error message (1)

LSAN Matrix in the cache conflicts with existing import/export devices and may disrupt traffic. Please refer to the man page for the corrective action.

Corrective actions:

- Any new router added to the backbone fabric automatically triggers a matrix merge. If a router does
 not support the matrix merge feature, the router cannot join the backbone fabric. Make sure that all
 legacy FCR switches in the backbone support the matrix merge feature, otherwise the feature is not
 supported.
- Use fcrIsanmatrix --fabricview -Isan | -fcr to confirm that all the switches in the backbone have the same LSAN and FCR Binding matrix. If not, there are two solutions. The first solution is to modify one FCR or both to make them the same and then activate the FCRs. The second solution is to zero out the database of one FCR to signal that this FCR accepts the database from the other FCR once the change is activated.

To zero out the database, execute the following commands:

- fcrlsanmatrix --add -lsan 0 0
- fcrlsanmatrix --apply -all
- In a dual backbone configuration, execute fcrlsanmatrix --fabricview on the FCR switches to confirm that the shared edge fabric FIDs have the same access in both backbones.
- Execute fcrIsanmatrix --display -Isan | -fcr and fcrproxydevshow -a. Check that the LSAN Binding matrix in the cache is not in conflict with the existing import/export devices that are displayed on the FCR switch. If there is a conflict, do one of the following:
 - Update the LSAN/FCR Binding matrix in the cache to allow access for the FIDs that have imported devices.
 - Remove the conflicting import/export devices by updating the LSAN zone in the edge fabrics.
 - Disable the conflicting devices.

Error message (2)

There may be other FCR switches in the backbone that do not support the LSAN Binding feature or do not have the same fcrlsanmatrix settings.

Please refer to the man page for the corrective action.

Corrective actions:

- Verify that all FCR switches in the backbone support the LSAN Binding features.
- Execute fcrlsanmatrix --fabricview to confirm that all the switches in the backbone have the same LSAN Binding matrix. If not, clear the LSAN Binding feature on all the switches and reapply the same LSAN Binding matrix on all the FCR switches in the backbone.
- In a dual backbone configuration, use fcrlsanmatrix --fabricview on the FCR switches to confirm that the shared edge fabric FIDs have the same access in both backbones.

Refer to the Fabric OS Message Reference manual for further diagnostic information.

EXAMPLES

To add the LSAN Zone Matrix data (For the following example, assume that the backbone has the following online edge fabrics (FIDs): 1, 2, 4, 5, 7, 8, and 10. Currently, FIDs 14 and 19 are not available.):

```
switch:admin> fcrlsanmatrix --add -lsan 4 5
switch:admin> fcrlsanmatrix --add -lsan 4 7
switch:admin> fcrlsanmatrix --add -lsan 10 14
switch:admin> fcrlsanmatrix --add -lsan 10 19
```

To remove an entry from the LSAN matrix:

```
switch:admin> fcrlsanmatrix --remove -lsan 10 14
```

To display the information from the cache:

switch:admin> fcrlsanmatrix --display -lsan

Fabric ID 1	Fabric ID 2
4	5
4	7
10	19

To apply the changes persistently:

```
switch:admin> fcrlsanmatrix --apply -lsan
```

To view the persistent changes:

```
switch:admin> fcrlsanmatrix -lsan

LSAN MATRIX is activated
Fabric ID 1 Fabric ID 2

4 5
7
10 19
```

To view the LSAN Zone static and default/dynamic binding in the backbone where online fabrics are: 1, 2, 4, 5, 7, 8, 10:

switch:admin> fcrlsanmatrix --fabricview -lsan
LSAN MATRIX is activated

Fabric ID 1	Fabric ID 2
4	5
4	7
10	19
Default LSAN Matrix:	
1 2 8	

To display all proxy devices for all FC Routers in the same backbone fabric whether or not they are relevant to this FC Router:

switch:admin> fcrproxydevshow -a

fcrPathTest

Tests the data path connection between the FC Router FPGA and the central ASIC.

SYNOPSIS

fcrpathtest

[--slot slot] [-unit number] [-path mode] [-nframes count]

DESCRIPTION

Use this command to verify the data path connecting the FC Router field-programmable gate array (FPGA) and the central ASIC by sending frames from the FC Router FPGA port N transmitter, and looping the frames back into the same port's receiver. The loopback is accomplished at the parallel loopback path. The path exercised in this test does not include the media or the fiber cable.

Only one frame is transmitted and received at any one time. An external cable is not required to run this test. The port LEDs flicker green rapidly while the test is running.

The test method is as follows:

- 1. Set all ports present for parallel loopback.
- 2. Create a frame F of maximum data size (2,112 bytes).
- 3. Transmit frame F by way of the FC Router FPGA port N.
- 4. Pick up the frame from the same port N.
- 5. Check if any of the following eight statistic error counters are nonzero: ENC_in, CRC_err, TruncFrm, FrmTooLong, BadEOF, Enc_out, BadOrdSet, DropRxUnavail.
- 6. Check if the transmit, receive, or Class 3 receiver counters are stuck at some value.
- 7. Check if the number of frames transmitted is not equal to the number of frames received.
- 8. Repeat steps 2 through 7 for all ports present until one of the following conditions is met:
 - a. The number of frames (or passCount) requested is reached.
 - b. All ports are marked bad.

At each pass, a different data type is used to create the frame from a palette of seven; if a pass of seven is requested, seven different frames are used in the test. If eight passes, the first seven frames are unique and the eighth is the same as the first pass.

The data palette of seven includes:

```
CSPAT: 0x7e, 0x7e, 0x7e, 0x7e, ...
BYTE_LFSR: 0x69, 0x01, 0x02, 0x05, ...
CHALF_SQ: 0x4a, 0x4a, 0x4a, 0x4a, ...
QUAD_NOT: 0x00, 0xff, 0x00, 0xff, ...
CQTR_SQ: 0x78, 0x78, 0x78, 0x78, ...
CRPAT: 0xbc, 0xbc, 0x23, 0x47, ...
RANDOM: 0x25, 0x7f, 0x6e, 0x9a, ...
```

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only on the Brocade FR4-18i blade.

The switch must be offline for this test to run.

OPERANDS

This command has the following operands:

--slot slot

Specifies the slot number on which the diagnostic operates. The default is 0 and

operates on fixed-port-count products.

-unit number

Specifies the FC Router FPGA to test. By default, all FC Router FPGAs in the

specified slot are tested. Valid *number* values include the following:

0

FC Router FPGA 0

1

FC Router FPGA 1

2

All FC Router FPGAs

-path mode

Specifies the loopback point for the test. By default, fcrPathTest uses the Central

ASIC loopback. Valid *mode* values include the following:

1

Central ASIC loopback

2

FC Router FPGA Serdes loopback

3

FC Router FPGA internal loopback

-nframes count

Specifies the number of frames to send. The test progresses until the specified

number of frames are transmitted on each port. The default value is 10.

DIAGNOSTICS

When a failure is detected, the test may report one or more of the following:

DIAG-DATA

The payload received by the specified port did not match the transmitted payload.

A cable, media, or ASIC failure is the probable cause. Check for a faulty SFP.

Replace the SFP if necessary.

DIAG-ERRSTAT

One of the ASIC internal counters detected a frame statistics error in the received

frame. A cable, media, or ASIC failure is the probable cause. Check for a faulty

SFP. Replace the SFP if necessary.

DIAG-INIT

The port failed to synchronize in the loopback mode requested. A cable, media, or

ASIC failure is the probable cause. Check for a faulty SFP. Replace the SFP if

necessary.

DIAG-PORTDIED

The specified port was in loopback mode and then lost sync. A cable, media, or

ASIC failure is the probable cause. Check for a faulty SFP. Replace the SFP if

necessary.

DIAG-STATS

The ASIC internal error counters detected an error in the received frame. This

error is similar to ERRSTATS, but includes verifying the Tx/Rx frame count statistics. The DIAG-STATS error can be caused by a faulty SFP or indicate deeper problems in the main board or ASIC. Check for a faulty SFP. Replace the

cable or SFP if necessary.

DIAG-TIMEOUT

The port failed to receive back a frame that was sent out. This can be caused by a faulty SFP or indicate deeper problems in the main board or ASIC. Check for a faulty SFP. Replace the SFP if necessary.

DIAG-XMIT

The specified port failed to transmit frames. This usually indicates an ASIC failure. Replace the blade or the switch.

EXAMPLES To test slot 2 with FC Router FPGA Serdes loopback sending 10frames:

```
switch:admin> fcrpathtest --slot 2 -path 2 -nframes 10
Running fcrpathtest ......
Test Complete: fcrpathtest Pass 10 of 10
Duration 0 hr, 0 min & 18 sec (0:0:18:942).
passed.
```

SEE ALSO fcrChipTest, portLoopbackTest

fcrPhyDevShow

Displays the FC Router physical device information.

SYNOPSIS fcrphydevshow [-a][-f FID][-w wwn][-c][-d]

DESCRIPTION

Use this command to display the physical (real) devices that are configured to be exported to other fabrics. A device is considered to be configured to be exported to another fabric if it is a member of an LSAN zone. The device is displayed only if it is discovered in the EX_Port-attached fabric and backbone fabric's name server (for instance, the device is online).

Physical device information is available only for physical devices that exist in fabrics attached to EX_Ports of FC Routers on the same backbone fabric as the current FC Router.

The default output displays only physical device information relevant to the current FC Router. Relevant physical devices include physical devices that are configured to be exported from fabrics attached to the current FC Router's EX Ports.

The physical devices are listed by fabric.

The -f and -w operands allow searching for physical devices based on fabric ID or port world wide name.

"No device found" is displayed if there is no physical device information available at the current FC Router.

Each line of the output displays:

Device Exists in Fabric

The fabric in which the physical device exists.

WWN

The world wide name of the device port.

Physical PID

The port ID of the physical device. This port ID is only relevant on the fabric specified by the "Device Exists in Fabric" column.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-a

Displays all physical devices for all FC Routers in the same backbone fabric whether or not they are relevant to the current FC Router.

-a -f FID

Displays the physical devices in the specified fabric for all FC Routers in the same backbone fabric whether or not they are relevant to the current FC Router.

-w wwn

Displays the physical devices with the specified port WWN.

-c

Clears login-related counters.

-d

Displays the following login-related counters. Counters are cleared upon reboot or failover.

login try

The number of times the device attempted to log in.

local failure

the number of times the device login failed because of missing LSAN zones within

the device fabric.

remote failure

fcr

the number of times the device login failed due to missing LSAN zones within the remote fabric.

EXAMPLES To display the physical devices relevant to an FC Router:

fcr:admin> fcr	phydevshow		
Device	,	WWN	Physical
Exists			PID
in Fabri	ic		
2	10:00:00:	00:c9:2b:6a:68	c70000
3	50:05:07:	65:05:84:09:0e	0100ef
3	50:05:07:	65:05:84:0b:83	0100e8
Total devices	displayed:	3	

SEE ALSO fcr Fabric Show, fcr Proxy Dev Show, fcr Route Show, Is an Zone Show, switch Show Is an Zone S

fcrProxyConfig

Displays or configures proxy devices presented by an FC Router.

SYNOPSIS fcrproxyconfig

[-s importedFID devWWN slot] [-r importedFID devWWN]

DESCRIPTION

Use this command to display or set the persistent configuration of proxy devices presented by the local FC Router.

When used without operand, this command displays the persistent proxy device configuration; otherwise, it sets the specified attributes to its new value.

The proxy device must be inactive prior to setting or clearing persistent attributes. Disabling EX_Ports (using the portDisable command) attached to the relevant edge fabric, removing the device from the appropriate LSAN zones, or disabling the physical device are valid methods of ensuring a proxy device is inactive.

Persistent proxy device configuration attributes apply to the local FC Router. Multiple FC Routers attached to the same edge fabric coordinate to present the same proxy devices. As a result, persistent proxy device configurations must be consistent across all FC Routers attached to the same edge fabric or unpredictable results may occur. If the proxy device configuration is not altered, no action is required. If the configuration is altered, then care must be taken to ensure consistency across all FC Routers attached to the same edge fabric.

When used without operands, this command displays the following information:

importedFID

The imported fabric ID of the proxy device.

devWWN

The port world wide name of the device.

Slot

The slot used for the device WWN. The device WWN-to-slot association is persistently stored. The slot format is XXYYH, where XX specifies the translate domain area_ID (valid values include F0H through FFH) and YY specifies the Port ID value or the low 8-bits of the proxy device address (valid values include 01H through 7FH). The address of the proxy device is derived from the PID format (for example, native, core, or extended edge) and the proxy device slot.

If no proxy device WWN is stored in any slot for all edge fabrics, the following message is displayed: "All slots empty."

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-s importedFID devWWN slot

Adds the specified *devWWN* (format: xx:xx:xx:xx:xx:xx:xx:xx) to the specified slot (format XXYYH, where XX is the translate domain area_ID [F0H through FFH] and YY is the port_ID [01H through 7FH]) for the edge fabric specified (1 through 128). The following messages may be displayed:

- "WWN does not exist in any proxy device slot." The WWN does not exist in any slot for the specified edge fabric.
- "Too many proxy slots configured. Remove some unused proxy device WWNs from their slots using the -r operand and try again." All slots are used for the specified edge fabric.
- "The specified slot already contains a WWN, overwrite? [y]" The specified slot already contains an entry. You are then prompted for confirmation.

-r importedFID devWWN

Removes the specified *devWWN* (format: XX:XX:XX:XX:XX:XX:XX) from its slot for the edge fabric specified by *importedFID* (1 through 128). If the WWN does not exist in any slot for the specified edge fabric, the following message is displayed: "WWN does not exist in any proxy device slot."

EXAMPLES

To display the persistent proxy device configuration:

switch:a	dmin> :	fcrproxyconfig	
Imported	FID	Device WWN	Slot
002	5	0:05:07:65:05:84:08:d7	f001
002	5	0:05:07:65:05:84:0a:7b	f002
002	2	2:00:00:20:37:c3:11:71	f001
002	2	2:00:00:20:37:c3:1a:8a	f002
003	1	0:00:00:00:c9:2b:6a:2c	f001

To persistently configure device WWN 00:11:22:33:44:55:66:77 to use slot f101h in fabric 5:

```
switch:admin> fcrproxyconfig -s 5 \ 00:11:22:33:44:55:66:77 f101
```

To remove device WWN 00:11:22:33:44:55:66:77 from its persistent slot in fabric 5:

```
switch:admin> fcrproxyconfig -r 5 \
    00:11:22:33:44:55:66:77
WWN deleted from proxy device slot
```

SEE ALSO

fcrPhyDevShow, fcrProxyDevShow, fcrXlateConfig, IsanZoneShow, switchShow

fcrProxyDevShow

Displays FC Router proxy device information.

SYNOPSIS fcrproxydevshow [-a][-f fabricid][-w wwn]

DESCRIPTION

Use this command to display the proxy devices presented by FC Router EX Ports and information about the proxy devices. A proxy device is a virtual device presented in to a fabric by an FC Router. A proxy device represents a real device on another fabric. When a proxy device is created in a fabric, the real Fibre Channel device is considered to be imported in to this fabric. The presence of a proxy device is required for inter-fabric device communication. The proxy device appears to the fabric as a real Fibre Channel device. It has a name server entry and is assigned a valid port ID.

Proxy device information is available only for proxy devices that are presented by FC Routers on the same backbone fabric as this FC Router.

The default output displays only proxy device information relevant to this FC Router. Relevant proxy devices include proxy devices created by this FC Router (devices imported by this FC Router).

The proxy devices are listed by fabric. Search parameters -f and -w allow searching for proxy devices based on fabric ID or port WWN.

"No proxy device found" is displayed if there is no proxy device information available on this FC Router.

This command displays the following information:

Proxy Created in Fabric

The fabric in which the proxy device has been created.

WWN

The WWN of the device port.

Proxy PID

The port ID of the proxy device. The port ID is only relevant on the fabric specified

by the "Proxy Created in Fabric" column.

Device Exists in Fabric

The fabric in which the physical device represented by this proxy device exists.

Physical PID

The port ID of the physical device. The port ID is relevant only on the fabric

specified by the "Device Exists in Fabric" column.

State

State includes:

Imported

Proxy device has been imported into the fabric.

Initializing

The proxy device is being initialized and will soon be imported into the fabric.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-a

Display all proxy devices for all FC Routers in the same backbone fabric whether or not they are relevant to this FC Router.

-a -f fabricid

Display the proxy devices in the specified fabric for all FC Routers in the same $\,$

backbone fabric whether or not they are relevant to this FC Router.

-f fabricid

Display the proxy devices in the specified fabric that are relevant to this FC

Router.

-w wwn

Displays proxy devices with the specified port WWN.

EXAMPLES To display the proxy devices relevant to this FC Router:

swi	itch:admin> fcrproxydevsh	w			
Pro	oxy WWN	Proxy	Device	Physic	al State
Cre	eated	PID	exists	PID	
in	Fabric		in Fabri	.C	
2	50:05:07:65:05:84:09:0e	01f001	3	0100ef	Imported
2	50:05:07:65:05:84:0b:83	01f000	3	0100e8	Imported
3	10:00:00:00:c9:2b:6a:68	02f000	2	c70000	Imported
	Total devices displayed:	3			

SEE ALSO fcrFabricShow, fcrRouteShow, IsanZoneShow, switchShow

fcrResourceShow

Displays FC Router physical resource usage.

SYNOPSIS fcrresourceshow

DESCRIPTION

Use this command to display the FC Router-available resources. The maximum number allowed versus the currently used is displayed for various resources. The command output includes:

LSAN Zones

The maximum versus the currently used LSAN zones.

LSAN Devices

The maximum versus the currently used LSAN device database entries. Each proxy or physical device constitutes an entry.

Proxy Device Slots

The maximum versus the currently used proxy device slots. A proxy device is presented to an edge fabric as being connected to a translate domain slot. A slot is the port number and AL_PA combination. The slot-to-device WWN association is persistently stored.

Phantom Node WWNs

The maximum versus the currently allocated phantom switch node WWNs. The phantom switch requires node WWNs for fabric-shortest-path-first (FSPF) and manageability purposes. Phantom node names are allocated from the pool sequentially and are not reused until the pool is exhausted and rolls over. The last allocated phantom node WWN is persistently stored. If the switch is disabled, the phantom node WWNs are not returned to the pool until the system reboots, because the phantom switch could still be accessible through other switches. Across a switch reboot, the allocation starts from the next usable WWN from the pool and not from the beginning.

Phantom Port WWNs

The maximum versus the currently used phantom domain port WWNs. Phantom domain ports require port WWNs for manageability purposes. Phantom domain ports include ports connecting front and translate domains (virtual ISLs), translate domain ports for proxy devices, and EX Ports. Phantom port names are allocated from the pool sequentially and are not resumed until the pool is exhausted and rolls over. The last allocated phantom port WWN is persistently stored. If the switch is disabled, phantom port WWNs are not returned to the pool until the system reboots, because the phantom switch might still be accessible through other switches. Across the switch reboot, the allocation starts from the next usable WWN base from the pool and not from the beginning.

Port Limits

Displays resources for each physical port (EX_Port), which include the following:

Max Proxy Devices

The maximum versus the currently used proxy device.

Max NR_Ports

The maximum versus the currently used NR_Port entries. Destination NR_Port entries are stored at every physical port for routing decision purposes.

NOTES Only configured EX/VEX_Ports are displayed

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display the resource usage for the local FC Router:

fcrRouterPortCost

Displays or sets an FC Router port cost.

SYNOPSIS

fcrrouterportcost [[slot/]port] [cost]

DESCRIPTION

Use this command to set or display the cost of the FC Router ports. You can set the cost of the link to one of two fixed values: 1000 or 10000. The option 0 sets the cost of the link to the default value based on link type (EX/VEX). The router module chooses the router port path based on the minimum cost per fabric ID (FID) connection. If multiple paths exist with the same minimum cost, the load is shared over these paths.

Every inter-fabric link (IFL) has a default cost. For an EX_Port IFL, the default cost is 1000. For a VEX Port, the default cost is 10000. If the cost is set to 0, the link cost defaults to 1000 for an EX Port and to 10000 for a VEX_Port.

when used without operands, this command displays the current link costs for all ports on the switch.

NOTES

Before setting the cost, ensure that admin is enabled for the EX_Port/VEX_Port with portCfgEXPort or portCfgVEXPort. The cost can be set only on a disabled port.

The bandwidth of an inter-fabric link (IFL) is unrelated to its default cost. In other words, 1 Gbps, 2 Gbps, 4 Gbps, and 8 Gbps EX Port IFLs have the same cost value of 1000 as their FC Router port.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port whose cost is to be displayed or changed, followed by a slash (/).

port

Specifies the number of the port whose cost is to be displayed or changed. This value is relative to the slot for bladed systems. Use switchShow for a list of valid ports. If a port is not specified, this command displays the costs of all ports.

cost

Specifies the new cost of the link connected to the specified port. This operand is optional; if omitted, this command displays the cost of the specified port. The cost of the link can be changed only when the specified port is disabled. Valid values for cost are 0, 1000 or 10000.

EXAMPLES

To display the cost of all EX_Ports:

Port	Cost
7/3	1000
7/4	1000
7/9	1000
7/10	1000
7/16	10000
10/0	10000

To display the cost on an EX_Port:

To set the cost of an EX_Port and display the result:

To set the default cost on the EX_Port:

SEE ALSO switchShow, fcrRouteShow, portCfgEXPort

fcrRouteShow

Displays FC Router route information.

SYNOPSIS fcrrouteshow

DESCRIPTION

Use this command to display routes through the FC Router backbone fabric to accessible destination fabrics. An FC Router backbone fabric is the fabric that contains the E_Ports of this platform and routes inter-fabric traffic between imported fabrics, creating a meta-SAN.

There are FC Router ports that reside on the backbone fabric. These ports are known as NR_Ports. NR_Ports send and receive inter-fabric traffic. For the AP7420, there is a one-to-one relationship between an NR_Port on a backbone fabric and an EX_Port. NR_Port technology enables EX_Ports to exchange traffic across an intermediate fabric. NR Ports are addressable entities on the backbone fabric and have port IDs relevant to the backbone fabric.

Because cascaded backbone/intermediate fabrics are currently not supported, an NR_Port provides a path to a single fabric with a single FC Router protocol cost. Multiple NR_Ports can provide paths to the same destination fabric.

"No routes found" is displayed if there is no route information available at this FC Router. There is no route information available if no EX_Ports are configured at this FC Router.

The output includes:

Destination Fabric ID

The destination fabric.

NR_Port PID

The port ID of the NR_Port. The port ID is relevant only on the backbone fabric. This NR_Port has a route to the destination fabric identified by the "Destination Fabric ID" column.

FCRP Cost

The FC Router protocol cost (for routing decisions) for this NR_Port. The FCRP cost is the same (1000) for all NR Ports.

WWN of the Principal Switch in the Dest. Fabric

The world wide name of the principal switch in the destination fabric.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the route information:

switch:admin> fcrrouteshow						
Destination	NR_Port	FCRP Cos	t WWN of Principal			
Fabric Id	PID	S	witch in the Dest. Fabric			
4	640000	1000	10:00:00:60:69:c0:05:d1			
4	640100	1000	10:00:00:60:69:c0:05:d1			
5	640200	1000	10:00:00:60:69:c0:20:ed			
5	640300	1000	10:00:00:60:69:c0:20:ed			

SEE ALSO

fcrFabricShow, fcrPhyDevShow, fcrProxyDevShow, IsanZoneShow, switchShow

fcrXlateConfig

Configures a translate (xlate) domain's domain ID and state of persistence for both the EX_Port-attached fabric and the backbone fabric.

SYNOPSIS fcrxlateconfig

fcrxlateconfig importedFID exportedFID preferredDomainID

fcrxlateconfig --remove | -r importedFID exportedFID

fcrxlateconfig --enable persistxd

fcrxlateconfig --disable persistxd

fcrxlateconfig --show stalexd importedFID

fcrxlateconfig --delete stalexd importedFID staleXlateDomainID

fcrxlateconfig --help

DESCRIPTION

Use this command to display a translate (xlate) domain ID or change the preferred domain ID and its state of persistence.

A translate domain is a phantom domain created by an FC Router. FC Routers emulate proxy devices representing real devices in remote fabrics. These proxy devices are emulated to be connected to translate domains. Translate domains are presented to a fabric as residing topologically behind front phantom domains (domains created by an EX_Port). In the case of backbone fabrics, translate domains are topologically behind an E_Port. In every EX_Port-attached edge fabric and backbone fabric, there can be a translate domain for every FC Router-accessible remote fabric.

During a fabric build, the translate domain requests a domain ID from the principal switch in the EX_Port-attached edge fabric. The domain ID requested is the preferred domain ID. You can set the preferred domain ID when the translate domain is not active and is persistently saved. The principal switch attempts to provide the translate domain with the requested domain ID, but it may not provide it if there are domain ID conflicts with other domains in the fabric. If the requested domain ID (such as the preferred domain ID) is unavailable, the domain ID assignment is completely at the discretion of the principal switch. The assignment domain ID is persistently stored and is used as the preferred domain ID in the future.

By default, FCR creates the translate domain for a remote fabric if a valid persistent translate domain ID is configured in the local fabric, even if no devices are imported or exported across the edge fabrics. Disabling the **persistxd** parameter prevents the xlate domain from being created. Enabling the **persistxd** parameter from a disabled state re-enables the FCR default behavior.

If the remote edge fabric becomes unreachable, the translate domains created in other edge fabrics for this remote edge fabric become stale. Use the **--show stalexd** option to identify translate domains that have become stale, and delete them in a nondisruptive manner with the **--delete stalexd** option.

When executed without operands, **fcrxlateconfig** displays for each translate domain the imported FID, the exported FID, the domain ID and the xlate WWN.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Information displayed is not related to the entire backbone. The FC Router displays only connections to an edge fabric for which there are translate domain IDs. Any changes you intend to make using this command should be issued on the switches to which the edge fabrics are directly attached. In a Virtual Fabric environment, this is the base switch.

OPERANDS

This command has the following operands:

fcrxlateconfig

Sets the preferred domain ID (1-239) to *preferredDomainID* for the translate phantom domain and saves the configuration persistently. The translate domain must be inactive to set the preferred domain ID. The following operands are required:

importedFID

Specifies the fabric ID (1 through 128) of the fabric that contains the translate domain.

exportedFID

Specifies the fabric ID (1 through 128) of the remote fabric represented by this translate domain.

preferredDomainID

Specifies the preferred domain ID (1 through 239) of the translate phantom domain.

--remove | -r

Removes the preferred domain ID of the translate phantom domain. The translate domain must be inactive to remove the preferred domain ID. The following operands are required:

importedFID

Specifies the fabric ID (1 through 128) of the fabric that contains the translate domain.

exportedFID

Specifies the fabric ID (1 through 128) of the remote fabric represented by this translate domain.

preferredDomainID

Specifies the preferred domain ID (1 through 239) of the translate phantom.

--enable persistxd

Enables translate domain persistence. When **persistxd** is enabled, the translate domain is created based on the persistent translate domain ID configuration. If a valid persistent translate domain ID is configured for a given *importedFID* and *exportedFID* pair, a translate domain for the *exportedFID* is created, even if no devices need to be imported or exported across the edge fabrics represented by *importedFID* and *exportedFID*. By default, **persistxd** is enabled.

--disable persistxd

Disables translate domain persistence. When **persistxd** is disabled, the translate domain is not created, even if a valid persistent translate domain ID is configured for the *importedFID* and *exportedFID* pair, so long as no devices are imported or exported across the edge fabrics represented by *importedFID* and *exportedFID*. Once devices need to be imported or exported across the edge fabrics, the translate domain is created.

--show stalexd [importedFID]

Displays stale translate domains associated with the specified Fabric ID (1-128). A translate domain becomes stale when the remote edge fabric for which this translate domain was created in the specified edge fabric becomes unreachable. When issued without specifying an imported FID, this command lists all stale translate domains in all edge fabrics connected to the FCR.

--delete stalexd importedFID staleXlateDomainID

Deletes the specified stale translate domain from the edge fabric specified by its fabric ID. This command must be executed in the FCR that owns the stale translate domain.

EXAMPLES

To display the translate domain configuration and the state of the **persistxd** parameter:

```
switch:admin> fcrxlateconfig
```

${\tt ImportedFid}$	ExportedFid	Domain	OwnerDid	XlateWWN
001	002	004	000001	N/A
001	005	003	N/A	N/A

Persist XD state: Enabled

To set the preferred domain ID of the translate domain created in fabric 2, which represents the remote fabric 3, to a value of 8:

```
switch:admin> fcrxlateconfig 2 3 8
xlate domain already configured, overwrite?(n) y
```

To clear the preferred domain ID of the translate domain created in fabric 2, which represents remote fabric 3:

```
switch:admin> fcrxlateconfig -r 2 3
xlate domain deleted
```

To enable translate domain persistence:

```
fcr:admin> fcrxlateconfig --enable persistxd
Persist XD is enabled
```

To disable translate domain persistence:

```
fcr:admin> fcrxlateconfig --disable persistxd
Persist XD is disabled
```

To identify and remove stale translate domains in a single backbone multiple FCR configuration:

To remove the stale translate domain (only the translate domain owned by the current owner can be removed; note that trailing zeros must be removed from the FID and Xlate domain ID.>):

```
fcr:admin> fcrxlateconfig --delete stalexd 12 2
Xlate domain 2 is deleted
```

SEE ALSO portCfgEXPort, portCfgVEXPort, portDisable, portEnable, portShow

fddCfg

Manages the fabric data distribution configuration parameters.

SYNOPSIS

fddcfg --showall

fddcfg --localaccept policy list

fddcfg --localreject policy_list

fddcfg --fabwideset policy list

DESCRIPTION

Use this command to manage the fabric data distribution configuration parameters. These parameters control the fabric-wide consistency policy.

Switches can be locally configured to allow or reject a security policy. Supported policies include the following:

SCC

Switch Connection Control policy

DCC

Device Connection Control policy

SCC

Switch Connection Control policy

PWD

Password policy

FCS

Fabric Configuration Server policy

PWD

Fabric Element Authentication policy

IPFILTER

IP Filter policy

Automatic distribution of a fabric-wide consistency policy is limited to SCC, DCC, and FCS policies. Use the --fabwideset parameter to enforce these policies fabric-wide in tolerant or strict mode, In strict mode, fabric-wide enforcement of FCS consistency policy is possible in mixed fabrics. However, switches that do not support the policies ignore them.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--showall

Displays the accept/reject configuration of all policy sets and the fabric-wide consistency policy on the switch.

--localaccept policy_list

Configures the switch to accept distributions of the specified policies. The policies in *policy list* must be separated by semicolons and enclosed in quotation marks: for example, "SCC;DCC;FCS".

--localreject policy_list

Configures the switch to reject distributions of the specified policies in *policy_list*. However, a database cannot be rejected if it is specified in the fabric-wide consistency policy. The policies in *policy_list* must be separated by semicolons and enclosed in quotation marks; for example, "SCC;DCC".

--fabwideset policy_list

Sets the fabric-wide consistency policy. A database that is set to reject distributions cannot be specified in the fabric-wide consistency policy. To set the fabric-wide consistency policy as strict, use the strictness indicator "S". To set the fabric-wide consistency policy as tolerant, omit the "S". A valid policy set should be of the form "SCC:S;DCC;FCS". To set the fabric-wide policy to NULL (default) or no fabric-wide consistency, use the policy Set "". Supported policies are Switch Connection Control (SCC), Device Connection Control (DCC), and Fabric Configuration Server (FCS). All members specified in a given policy set are automatically distributed to all participating switches in the fabric that support the policy. Refer to the DESCRIPTION section for specific exceptions. In the presence of a fabric-wide FCS consistency policy, this command can only be run from the primary FCS switch.

EXAMPLES To display the fabric-wide consistency policy and the accept/reject configuration for all databases:

To configure the switch to accept distribution of the SCC policy set and PWD database:

```
switch:admin> fddcfg --localaccept "SCC;PWD"
Local Switch Configured to accept policies.
```

To configure this switch to reject distribution of SCC and DCC policy sets:

```
switch:admin> fddcfg --localreject "SCC;DCC"
Local Switch Configured to reject policies.
```

To set the fabric-wide consistency policy to "strict" for SCC and "tolerant" for DCC and FCS:

```
switch:admin> fddcfg --fabwideset "SCC:S;DCC;FCS"
```

SEE ALSO distribute

fdmiCacheShow

Displays abbreviated remote FDMI device information, according to remote domain ID.

SYNOPSIS fdmicacheshow

DESCRIPTION

Use this command to display FDMI cache information for remote domains only.

The state of each remote domain, identified by its domain ID, is shown to be unknown, known, unsupported, or error.

The revision of the switch also displays, followed by the world wide name of the switch.

For HBAs, only the HBA identifiers and registered port lists are displayed. No detailed HBA attributes are displayed. For registered ports, only port identifier and corresponding HBA are shown; no detailed port attributes are displayed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

OPERANDS None

EXAMPLES

To display the FDMI cache:

```
switch:admin> fdmicacheshow
Switch entry for domain 3
 state: known
 version: v310
 wwn:
          10:00:00:60:69:90:03:c7
 HBAs:
   10:00:00:00:c9:25:9b:96
 Ports: 1
     10:00:00:00:c9:25:9b:96
Total count of devices on the switch is 1
```

SEE ALSO fdmiShow

336

fdmiShow

Displays detailed FDMI device information.

SYNOPSIS fdmishow

DESCRIPTION Use this command to display FDMI information for all HBAs and ports.

Detailed FDMI information is displayed for local HBAs and ports. This information includes the HBA with its corresponding ports, along with their respective attributes.

Only abbreviated FDMI information is shown for HBA and ports on remote switches.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display FDMI information on a local switch:

```
switch:admin> fdmishow
Local HBA database contains:
10:00:00:00:c9:25:9b:96
Ports: 1
  10:00:00:00:c9:25:9b:96
  Port attributes:

  Max CT Payload Length: 0x00061300
Local Port database contains:
 10:00:00:00:c9:25:9b:96
Remote HBA database contains no entry.
Remote Port database contains no entry.
```

SEE ALSO fdmiCacheShow

ficonCfg

Configures the specified FICON database.

SYNOPSIS ficoncfg --set database port

ficoncfg --reset database

ficoncfg --help

DESCRIPTION Use this command to configure a FICON database on a specified port. Refer to ficonShow for a

description of the database content.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

port

Specifies the port to be configured. You can specify the port by its port index

number or by a hexadecimal number. Use switchShow for a listing of valid port

index numbers.

--set

Sets the configuration entry.

--reset

Resets the configuration entry to its default value.

database

Specifies the name of the FICON database. The only database currently

supported is the following:

LIRR

Devices registered to receive link incident reports.

EXAMPLES To set the LIRR database on a port using a decimal index number:

```
switch:user> ficoncfg --set LIRR 27
```

To reset the LIRR

```
switch:user> ficoncfg --reset LIRR
```

To set the LIRR database using a hexadecimal port number:

```
switch:user> ficoncfg --set LIRR 0x1b
switch:user> ficoncfg --show LIRR
The Local LIRR database has 0 entries.
```

Current LIRR device port number: 27 (0x1b)

SEE ALSO ficonHelp, ficonShow

ficonClear

Clears the records from the specified FICON database.

SYNOPSIS ficonclear database

DESCRIPTION Use this command to remove records from the local FICON database. The command effect depends on

the specified database.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

database

Specifies the name of the FICON database. The databases include the following:

RLIR

Remove all entries from the link incidents database including implicit link incidents

(ILIR).

RNID

Remove all the "not current" entries from the device node identification database. The entries are for devices that were previously connected but are no longer online. Note that "current" entries are not removed from the RNID database.

EXAMPLES To clear the RLIR database:

switch:user> ficonclear RLIR
successfully clear local RLIR Database.

To clear the RNID database:

switch:user> ficonclear RNID
successfully clear not current
entries from local RNID Database.

SEE ALSO ficonHelp, ficonShow

ficonCupSet

Sets FICON-CUP parameters for a switch.

SYNOPSIS ficoncupset fmsmode enable | disable

ficoncupset modereg bitname 0 | 1

ficoncupset MIHPTO seconds

ficoncupset CRP PID CHID

DESCRIPTION

Use this command to set FICON-CUP (Control Unit Port) parameters for a switch. All parameters can be set while the switch is online. Changes made by this command take effect immediately. A reboot is not required.

Use **ficonCupShow** to display current settings.

NOTES

A FICON License is required to enable FMSMODE and to manage ports with FICON CUP. Without a license, FICON CUP traffic will not be allowed.

When FMSMODE is enabled, port names are truncated to 24 characters to be FICON compliant, and a 24-character limit is imposed on all newly created port names.

FICON Management Server (FMS) mode cannot be enabled if port ID (PID) Format 2 is used. Refer to the Fabric OS Administrator's Guide for information on PID formats.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

fmsmode

Configures the FICON Management Server (FMS) mode for the switch. Specify

one of the following modes:

enable

Enables the FICON Management Server mode. When you enable the switch, you

must wait until all ports have come online before enabling fmsmode.

disable

Disables the FICON Management Server mode.

modereg

Set a bit in the FICON-CUP mode register. The following operands are required:

bitname 0 | 1

Specifies a given bit value to be (1) set or not set (0). Valid values for bitname are

POSC

Programmed offline state control

UAM

User alert mode

ASM

Active=saved mode

DCAM

Director clock alert mode

ACP

Alternate control prohibited

HCP

Host control prohibited

MIHPTO

Sets the missing interrupt handler primary timeout (MIHPTO) value for the CUP. The following operand is required:

seconds

Specifies the timeout value in seconds. Provide a decimal value in the range between 15 and 600 seconds. The default timeout value is 180 seconds. If a value greater than 63 seconds is specified, the timeout value is rounded down to the closest value divisible by 10. For example, an MIHPTO timeout value of 86 defaults to 80.

CRP PID CHID

Sets the current reporting path (CRP). The reporting path is a CUP mechanism for sending FRU-failure reports to a FICON logical path via FICON protocol. The logical path between the PID and the CHID must exist and be in operational state for this command to succeed. Use ficonCupShow with the LP option to display the logical paths on the switch. The following operands are required:

PID

Specifies the Port identifier.

CHID

Specifies the Channel ID (CHID). The CHID is the Logical Partition (LPAR) identifier supplied as part of the FICON protocol header. The format of the CHID is a numerical identifier followed by a letter, for example, 1B.

EXAMPLES To enable FMS mode for the switch:

```
switch:admin> ficoncupset fmsmode enable
fmsmode for the switch is now Enabled
```

To set the ASM bit in the mode register for the switch:

```
switch:admin> ficoncupset modereg ASM 1
Active=Saved Mode bit is set to 1
```

To set the MIHPTO value to 60 seconds:

```
switch:admin> ficoncupset MIHPTO 60
MIHPTO has been changed to 60 seconds
```

To set the current reporting path:

```
switch:admin> ficoncupset CRP 082300 1A
```

To display the current reporting path:

```
switch:admin> ficoncupshow LP
FICON CUP Logical Paths for CUP 0x08FE00
```

	LP	Reporting	
PID	CHID	State	Path

SEE ALSO ficonCupShow

ficonCupShow

Displays FICON-CUP parameters for a switch.

SYNOPSIS ficoncupshow fmsmode

ficoncupshow modereq [bitname]

ficoncupshow MIHPTO

ficoncupshow LP

DESCRIPTION Use this command to display FICON-CUP (Control Unit Port) parameters for a switch.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

aetaiis.

OPERANDS This command has the following operands:

fmsmode

Display the FICON Management Server (FMS) mode for the switch.

modereg

Display the FICON-CUP mode register. If no operand is specified, all mode register bit settings are displayed. If a mode register bit name is specified, then only the value of that bit is displayed. A value of 1 indicates that a given mode

register bit is set, and 0 indicates that it is not set.

The following operand is optional:

bitname

Displays the specified mode register bit as either set (1) or not set (0). Valid values

for *bitname* include the following:

POSC

Programmed offline state control

UAM

User alert mode

ASM

Active=saved mode

DCAM

Director clock alert mode

ACP

Alternate control prohibited

HCP

Host control prohibited

MIHPTO

Displays the FICON-CUP missing interrupt handler primary timeout (MIHPTO)

value in seconds.

LΡ

Displays the logical paths on the switch. For each entry, the command displays the port identifier (PID), the LPAR identifier (CHID), reporting state (operational or

reset (=nonoperational)), and path (current or primary).

EXAMPLES

To display the FMS mode for the switch:

```
switch:user> ficoncupshow fmsmode
fmsmode for the switch: Enabled
```

To display the mode register for the switch:

```
switch:user> ficoncupshow modereg
POSC UAM ASM DCAM ACP HCP
  1 0 1 1 1 0
```

To display the ASM bit in the mode register for the switch:

```
switch:user> ficoncupshow modereg ASM
ASM
  1
```

To display the MIHPTO value for the CUP:

```
switch:user> ficoncupshow MIHPTO
MIHPTO for the CUP: 60 seconds
```

To display the logical paths for the switch:

switch:user> ficoncupshow LP

FICON CUP Logical Paths for CUP 0x08FE00

	LP	Reporting

ficonCupSet, ficonHelp

ficonHelp

Displays a list of FICON support commands.

SYNOPSIS ficonhelp

DESCRIPTION Use this command to display a list of FICON support commands with descriptions.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display a list of FICON commands:

switch:admin> ficonhelp

ficoncfg Manage FICON configuration

ficonclear Clears contents of the specified FICON

management database

ficoncupset Sets FICON-CUP parameters for a switch ficoncupshow Displays FICON-CUP parameters for a switch

ficonhelp Displays FICON commands

ficonshow Displays contents of the specified FICON

management

SEE ALSO None

ficonShow

Displays the contents of the specified FICON database.

SYNOPSIS ficonshow database [fabric]

DESCRIPTION

Use this command to display the contents of a FICON database. The ficonShow database operand is the name of the database to display. If the fabric operand is absent, the command displays the members of the named database that are local to the switch on which the command was issued. If the fabric operand is present, it must be entered exactly as shown, and this specifies that all members are displayed, both local and remote.

The following information may be displayed, depending on which database you enter and which operands you use with the command:

Domain

Displays the domain ID.

Fabric WWN

Displays the fabric WWN.

Flag

Indicates if the node is valid, not valid, or not current. Flag values are as follows:

0x00

Indicates the node ID of the storage port is valid.

0x10

Indicates the node ID of the channel port is valid.

0x20

Indicates the node ID of the storage port is not current.

0x30

Indicates the node ID of the channel port is not current.

0x40

Indicates the node ID of the storage port for the RNID switch for RLIR is not valid.

0x50

Indicates the node ID of the channel port is not valid.

Fmt

Displays the record-registration format.

FRU Failure Description

Indicates the FRU failure type as one of the following:

WWN card [unit number]

The WWN card

Power Supply [unit number]

The Power Supply card

Hardware Slot [unit number]

The Hardware Slot

Blower [unit number]

The Blower

FRU Part Number

Displays the FRU part number.

FRU Serial Number

Displays the FRU serial number.

ficonShow 2

Incident Count

Displays the incident count. This number increases by 1 for each incident within the individual switch.

Link Incident Description

Same as Link Incident Type.

Link Incident Type

Indicates the link incident type as one of the following:

- Bit-error-rate threshold exceeded
- Loss of signal or synchronization
- NOS recognized
- Primitive sequence timeout
- Invalid primitive sequence for port state

Listener PID

Same as PID.

Listener Port Type

Same as Port Type.

Listener Port WWN

Displays the channel HBA port world wide name.

Listener Type

Indicates the listener type as follows:

Conditional

This port receives a link incident record if no other recipients from the established

registration list have been chosen.

Unconditional

This port is always chosen as a recipient of a link incident record.

Manufacturer

Displays the manufacturer name or code.

Model Number

Displays the model number.

Node Parameters

Same as Parameters.

Parameters

Displays the node type for the switch in three bytes, 0xAABBCC:

Byte AA 0x20

FC-SB-2 and updates

Byte BB 0x0a

Switch

Byte CC 0x00

Port number. It is dynamically assigned whenever a link incident occurs.

Parm

Displays the incident node parameters type in three bytes, 0xAABBCC:

Byte AA

Possible values include the following:

0x00

Reserved.

0x20

FC-SB-2 and updates.

0x40 Other FC-4s including FCP and updates. 0x60 FC-SB-2 and updates and other FC-4s including FCP and updates. 0x80 FC-4 support not specified. 0xa0 Reserved. 0xc0 Reserved. 0xe0 Vendor-specific. Byte BB Possible values include the following: 0x00 Unspecified class. 0x01 Direct access storage device, if it is a storage port; otherwise, not channel-to-channel capable. 0x02 Magnetic tape, if it is a storage port; otherwise, a reserved field for a channel 0x03 Input unit record, if it is a storage port; otherwise, a reserved field for a channel port. 0x04 Output unit, if it is a storage port; otherwise, a reserved field for a channel port. 0x05 Reserved field for a channel port. 0x06 Controller, if it is a storage port; otherwise, a reserved field for a channel port. 0x07 Terminal - Full screen if it is a storage port; otherwise, a reserved field for a channel port. 0x08 Terminal - Line mode if it is a storage port; otherwise, an emulated control unit support only. 0x09 Reserved. 0x10 Switch, if it is a switch device; otherwise, reserved. 0x0b-0xff Reserved. Byte CC Possible values include the following: 0x00 If storage CU port has registered with the switch.

0xID

CHIPID if channel port has registered with the switch.

0xPN

If switch has registered with the channel, PN represents the FL port number.

Part Number

Displays the switch chassis part number.

PID

Displays the 24-bit Fibre Channel port address in 0xDDAAPP format. DD is

Domain ID. AA is Area ID. PP is AL_PA ID.

Plant of Manufacture

Displays the manufacturer plant name or code.

Port

Physical port number.

Port Status

Displays the status of the port as one of the following:

Link degraded but operational

Link not operational

Port Type

Displays the port type as one of the following:

U

Unknown

Ν

N_Port

NL

NL_Port

Protocol

Displays whether the traffic is using FICON or FCP.

Registered Node WWN

Displays the device's node world wide name associated with the device HBA.

Registered Port WWN

Displays the device's channel or storage CU port world wide name associated

with the device HBA.

Sequence Number

Displays the sequence number of the self-describing node.

Serial Number

Displays the switch serial number.

Switch node WWN

Displays the switch node world wide name.

Switch Port WWN

Displays the switch port world wide name.

Switch WWN

Displays the switch WWN.

Tag

Displays the physical identifier for the self-describing node interface.

TS Format

Displays the Time Server format.

Time Stamp

Displays the timestamp, expressed in date format.

Type

Same as Port Type.

Type Number

Displays the type number of the self-describing node. It also describes the

machine type.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

database

Specify the database to display. This operand is required. Valid values include the

following

RNID

Device node identification.

LIRR

Devices registered to receive link incident reports. Entries can have the following

flags:

-C*

A user-configured LIRR entry defined as current (set with the ficonCfg

command).

-C

A LIRR entry defined by the management server demon as current based on

order.

-S

A LIRR entry defined by the management server demon as secondary.

SwitchRNID

Switch node identification.

RLIR

Link incident reports.

ILIR

Implicit link incident reports.

fabric

Displays FICON database information for the entire fabric. This operand is optional; if omitted, only local members of the named database are displayed.

EXAMPLES

To display the local RNID database:

```
102b
     tag:
    {Fmt Type PID Registered Port WWN Registered Node WWN \
     0x18 N 502e00 50:05:07:64:01:40:0f:ca 50:05:07:64:00:c1:69:ca \
         flag Parm
         0x10 0x200105
    Type number:
                           002064
     Model number:
                           101
     Manufacturer:
                           IBM
     Plant of Manufacture: 02
     Sequence Number: 000000169CA
     tag:
                            052e
To display the local LIRR database:
   switch:admin> ficonshow LIRR
       The Local LIRR database has 0 entries.
   Current LIRR device port number: 27 (0x1b)
To display the local and remote LIRR database:
   switch:admin> ficonshow LIRR fabric
                    Listener Port WWN
    {Fmt Type PID
    0x18 N
              502d00 50:05:07:64:01:40:11:79 \
    0x18 N
               510d00 50:05:07:64:01:00:15:8c \
    0x18 N
              510f00 50:05:07:64:01:00:14:62 \
   Switch Port WWN
                           Listener Type

SEE ALSO ficonClear

fipsCfg

Configures FIPS (Federal Information Processing Standards) mode.

SYNOPSIS

```
fipscfq --enable fips | selftests | bootprom]
     [-nowarn]
```

fipscfg --disable selftests | bootprom] [-nowarn]

fipscfq --zeroize [-nowarn]

fipscfg --show | --showall

fipscfg --force fips

fipscfq --verify fips

DESCRIPTION

Use this command to configure FIPS mode on the switch. In this mode, only FIPS-compliant algorithms are allowed. As part of FIPS 140-2 level-2 compliance, passwords, shared secrets and the private keys used in SSL/TLS, system login, etc., need to be zeroized. Power-up self tests are executed when the switch is powered on to check for the consistency of the algorithms implemented on the switch.

This command prompts for confirmation before FIPS configuration changes take effect. Specifying no cancels the operation. The **-nowarn**option overrides the prompting.

NOTES

Certain services and functions, such as FTP, HTTP, remote procedure calls (RPC), root account, boot prom access, etc., must be blocked before the system can enter FIPS mode.

LDAP should not be configured while FIPS is enabled.

The system must be rebooted for FIPS mode changes to take effect.

Refer to the Fabric OS Administrator's Guide for information on configuring your system for FIPS 140-2 level-2 compliance.

FIPS mode cannot be modified through configDownload.

FIPS is not supported on all platforms. For FIPS-compliant hardware, refer to the Fabric OS Administrator's Guide.

In a Virtual Fabric environment, FIPS is treated as chassis-wide configuration and applies to all logical switches in the chassis. Chassis permissions are required to configure FIPS.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--help

Prints command usage.

--disable selftests [-nowarn]

Disables selftests mode.

--enable [fips | selftests] [-nowarn]

Enables FIPS or selftests mode. Selftests must be enabled before FIPS mode is enabled.

--zeroize [-nowarn]

Erases all passwords, shared secrets, private keys, etc. in the system.

--show | --showall

Displays the current FIPS configuration.

--force fips

This option enables FIPS mode even if prerequisites are not met, except under the following two conditions:

- In a dual-CP system if HA is not in sync between the two CPs.
- If selftests is in a disabled state.

--verify fips

Scans the prerequisites for enabling FIPS and print the failure/success cases.

--disable | --enable bootprom [-nowarn]

Disables or enables the Boot Programmable Read-Only Memory (Boot PROM) on the switch. Boot PROM access is blocked in FIPS mode. Disabling Boot PROM requires root permission. Enabling Boot PROM does not require root permission.

EXAMPLES

To display the current FIPS configuration:

```
switch:admin> fipscfg --show
FIPS mode is : Disabled
FIPS Selftests mode/status is : Disabled/None
```

To enable selftests:

To verify FIPS prerequisites:

```
switch:admin> fipscfg --verify fips
Standby firmware supports FIPS
SELF tests check has passed
Root account is enabled.
Radius check has passed
Authentication check has passed
SNMP is in read only mode.
Bootprom access is disabled.
Firmwaredownload signature verification is enabled.
cfgload.secure parameter value is 1.
```

To enable FIPS after prerequisites have been met:

```
switch:admin> fipscfg --enable fips
You are enabling FIPS.
Do you want to continue? (yes, y, no, n) [no] : yes
FIPS mode has been set to : Enabled
Please reboot the system
switch:admin> fipscfg --show
FIPS mode is : Enabled
```

To attempt enabling FIPS when prerequisites are not met:

```
switch:admin> fipscfg --enable fips
SelfTests mode is not enabled.
Root account is enabled.
Authentication uses MD5 hash algorithm.
Authentication uses DH group 0.
Telnet port number <23> for the policy <default_ipv4> \
is in permit state.
HTTP port number <80> for the policy <default_ipv4> \
is in permit state.
RPC port number <898> for the policy <default_ipv4> \
is in permit state.
Telnet port number <23> for the policy <default_ipv6>\
 is in permit state.
HTTP port number <80> for the policy <default_ipv6> \
is in permit state.
RPC port number <898> for the policy <default_ipv6> \
is in permit state.
SNMP is not in read only mode.
Bootprom access is enabled.
FIPS mode cannot be configured at this time
```

To back out of a zeroizing operation:

```
switch:admin> fipscfg --zeroize
You are Zeroizing FIPS configuration.
Do you want to continue? (yes, y, no, n) [no]: no
Operation cancelled.
switch:admin> fipscfg --zeroize
You are Zeroizing FIPS configuration.
Do you want to continue? (yes, y, no, n) [no]: yes
Executing 'secauthsecret --remove --all':
This command deletes database of DH-CHAP secret keys.
   If a fabric requires authentication, deleting this \
  database may cause switch to segment from the fabric.
Do want to remove secret key database? \
   (yes, y, no, n): [no]
Operation cancelled...
Executing 'pkiremove':
WARNING!!!
Removing pki objects will impair the security functionality
of this fibre channel switch. If you want secure mode enabled,
you will need to get the switch certificate again.
About to remove Pki objects.
ARE YOU SURE (yes, y, no, n): [no]
Operation cancelled.
Executing 'passwddefault':
Password policies are already set to default.
Executing 'seccertutil delkey':
Deleting the key pair will automatically do the following:
```

- 1. Delete all existing CSRs.
- 2. Delete all existing certificates.
- 3. Reset the certificate filename to none.
- 4. Disable secure protocols.

Continue (yes, y, no, n): [no]
Operation cancelled.
Zeroizing Radius configuration:
RADIUS configuration does not exist.
LDAP configuration does not exist.
Zeroizing IPSec static SA configuration.
Zeroizing SSH key.
Permission denied to perform this operation.
Failed to zeroize SSH public key.
switch:admin>

To disable bootprom:

switch:root> fipscfg --disable bootprom
You are disabling bootprom.
Do you want to continue? (yes, y, no, n) [no] : no
Operation cancelled.

SEE ALSO None

firmwareCommit

Commits switch firmware.

SYNOPSIS firmwarecommit

DESCRIPTION

Use this command to commit a firmware download to a CP. This command copies an updated firmware image to the secondary partition and commits both partitions of the CP to an updated version of the firmware. This must be done after each firmware download and after the switch has been rebooted and a sanity check is performed to make sure the new image is fine.

For switches that have nonvolatile memory set into two equal partitions, the primary partition is the where the system boots from; the secondary partition is where a copy of the firmware is stored, in case the primary partition is damaged.

To maintain the integrity of the firmware image in the nonvolatile memory, the **firmwareDownload** command updates the secondary partition only. When **firmwareDownload** completes successfully and the CP is rebooted, the system switches the primary partition (with the old firmware) to the secondary, and the secondary partition (with the new firmware) to the primary.

The default behavior of the **firmwareDownload** command is to automatically run the **firmwareCommit** command after the reboot. If you decide to disable the autocommit option when running **firmwareDownload**, you must execute one of the following two commands after the CP is rebooted:

- firmwareCommit copies the primary partition (with new firmware) to the secondary and commits the new firmware to both partitions of the CP.
- firmwareRestore copies the secondary partition (with the old firmware) to the primary and backs out
 of the new firmware download. The firmwareRestore command can be run only if autocommit was
 disabled during the firmware download. Autocommit can be disabled only when you run
 firmwareDownload in single mode.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To commit a new version of the firmware:

```
switch:admin> firmwarecommit
Validating primary partition...
Doing firmwarecommit now.
Please wait ...
Replicating kernel image
..........
FirmwareCommit completes successfully.
```

SEE ALSO

firmwareDownload, firmwareRestore

firmwareDownload

Downloads firmware from a remote host, a local directory, or a USB device.

SYNOPSIS

To invoke the command in interactive mode:

```
firmwaredownload
```

To download FOS firmware over a network:

To download SAS/SA firmware over a network (deprecated):

```
firmwaredownload -a sas | dmm | application
```

```
[-t slot[,slot]...]
[-p ftp | scp | sftp ] [-c ] [-r ]
host, user, pfile, passwd
```

To download SAS firmware over a network and remove the existing SA firmware at the same time (deprecated):

```
firmwaredownload -a sas [-t slot[,slot]...]
[-p ftp | scp | sftp ][-c][-e][-r]
host, user, pfile, passwd
```

To download FOS firmware from a USB device:

```
firmwaredownload [ -s [ -b | -n ] ] [ -U ]

[ -c ] [ -r ] pfile
```

To download SAS/SA firmware from a USB device (deprecated):

```
firmwaredownload -a sas | dmm | application
```

```
[-t slot[,slot]...]
[-U][-c][-r] pfile
```

To download SAS firmware from a USB device and remove the existing SA firmware at the same time (deprecated):

```
firmwaredownload -a sas [ -t slot[, slot]... ] [ -U ] [ -c ] [ -r ] [ -e ] pfile
```

DESCRIPTION

Use this command to download switch firmware from an FTP or SSH server or local NFS directory to nonvolatile storage. Switch firmware can also be downloaded from an external USB device on platforms that support USB.

The new firmware is downloaded as a bundle of packages. Package names are defined in a *.plist file along with other firmware information (time stamp, platform code, version, etc.). These packages are made available periodically to add features or to remedy defects. Contact customer support to obtain information about available firmware versions.

On enterprise-class platforms, this command, by default, downloads the firmware image to both control processors (CPs) in rollover mode to prevent disruption to application services. This operation depends on High Availability (HA) support. If HAis not available, use the **-s** option to upgrade the CPs one at a time.

All systems supported by this firmware have two partitions of nonvolatile storage (primary and secondary) to store two firmware images. This command always downloads the new image to the secondary partition and then swaps partitions so the secondary partition becomes the primary.

By default, **firmwareDownload** reboots the system and activates the new image. Finally, the command performs a **firmwareCommit** automatically to copy the new image to the other partition. In systems with blade processors (BPs), after the new CP firmware is downloaded to the system and activated, the BP firmware is downloaded to the BP processors if there is a mismatch between the BP and CP firmware.

By default, **firmwareDownload** performs a full install, autoreboot, and autocommit. These modes are selectable only in single CP (-s) mode, in which case autoreboot is OFF by default.

For each standalone switch in your fabric, complete all firmware download changes before issuing the **firmwareDownload** command on the next switch to ensure a nondisruptive download.

If **firmwareDownload** is interrupted due to an unexpected reboot as a result of a software error or power failure, the command automatically recovers the corrupted secondary partition. Wait for the recovery to complete before starting another firmware download.

NOTES

Firmware download and subsequent POST failure may occur on some platforms, if the firmware commit operation coincides with the execution of POST. The recommended work around is to disable POST (diagDisablePost) before you initiate a firmware download and re-enable POST (diagEnablePost) after the firmware commit operation has completed.

Firmware download procedures may vary depending on which Fabric OS version you are migrating from. See the *Fabric OS Administrator's Guide* for restrictions on changing Fabric OS versions.

On certain occasions, you may see messages in the console output of **firmwareDownload**. These are internal messages generated by the Linux utilities. You can safely ignore these messages. For relevant Brocade-generated firmware download messages, refer to the *Fabric OS Message Reference*(SULB module).

To correlate Brocade blade names with blade IDs, use the slotShow command.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operands are optional. When invoked without operands, the command goes into interactive mode.

-U

Downloads the firmware from an attached USB device. This option is valid only on platforms that support a USB port. Refer to your specific Hardware Reference Guide for details. The USB device must be enabled prior to firmware download with the **usbStorage** command. Firmware must be stored under the default firmware directory in the USB file system. On a dual-CP chassis, the USB device must be attached to the active CP. When downloading firmware from a USB device, the **-p** option is ignored.

-s

Enables single-CP mode. This mode supports selectively enabling or disabling a full install, autoreboot, and autocommit on bladed and nonbladed systems. On enterprise-class platforms, this mode supports upgrading a single CP. When downloading the main Fabric OS firmware, this option disables autoreboot, unless overridden by the **-b** option.

-b

Enables autoreboot mode. When single CP mode is enabled and this operand is not specified, **reboot** must be run manually to activate the downloaded image. If autoreboot mode is enabled, the switch reboots automatically after the firmware has been downloaded.

-n

Disables autocommit mode. When autocommit mode is disabled, the **firmwareCommit** command must be executed manually to propagate the downloaded image to both partitions of the storage device.

host

Specify a valid FTP or SSH server name or IP address. IPV4 and IPv6 addresses are supported. The firmware is downloaded from the specified host. If a host is not specified, the firmware is considered accessible on a local directory. To mention an FTP server by name, a DNS server must first be set up with the <code>dnsConfig</code> command. If DNS is enabled and a server name is specified, <code>firmwareDownload</code> automatically determines whether IPv4 or IPv6 should be used.

user

Specify a user name for FTP or SSH server access. This operand can be omitted, if the firmware is accessible on a local directory, a USB device, or by anonymous FTP server access. A user name other than "anonymous" is required for SSH server access.

pfile

Specify a fully qualified path for the firmware *pfile*. Absolute path names may be specified using forward slashes (/).

passwd

Specify a password. This operand can be omitted, if the firmware is accessible through a local directory or an attached USB device, or if no password is required by the FTP server. This operand is required when accessing an SSH server. In Fabric OS v7.0.0 or later, you can omit the password if the switch is configured as follows:

- The switch must be configured with public key authentication. Refer to the sshUtil help page for more information.
- You select a secure protocol (SCP or SFTP).
- The private key is installed on the switch, and the public key is exported to the remote host. Refer to the Fabric OS Administrator's Guide for configuration procedures.
- **-p** scp | ftp | sftp

Specify the file transfer protocol. Valid values are **ftp** (file transfer protocol), **sftp** (secure file transfer protocol), and **scp** (secure copy protocol). Values are not case-sensitive. If **-p** is not specified, **firmwareCommit** determines the protocol automatically by checking the config.security parameter.

-a fos | sas | application

Specify the type of firmware to be downloaded. Accepted values are **fos**, **sas**, or any valid application name. Values are not case-sensitive. This operand is no longer supported as of Fabric OS v7.0.0.

-t *slot*[,*slot*]...

Specify the target slots for the firmware download. Valid values are a list of slot numbers separated by commas.

-C

Disables version compatibility checking. By default, **firmwareDownload** checks if the firmware being downloaded is compatible with other running firmware images in the system. If the firmware version is not compatible, **firmwareDownload** fails. If this option is specified, version compatibility checking is disabled.

-е

Removes all of the installed SA images in the system during SAS **firmware download**. By default, downloading a SAS image does not remove the installed SA images. If this option is specified, the installed SA images are removed. This option is only valid with the **-a sas** option. This operand is no longer supported as of Fabric OS v7.0.0.

-0

Bypasses the checking of Coordinated HotCode Load (HCL). On single CP systems in InterOp fabrics, the HCL protocol is used to ensure data traffic is not disrupted during firmware upgrades. This option allows **firmwareDownload** to continue even if HCL is not supported in the fabric or the protocol fails. Using this option may cause traffic disruption for some switches in the fabric. This operand is no longer supported as of Fabric OS v7.0.0.

-r

Downloads the firmware to the secondary partition only.

DIAGNOSTICS

The command checks the network connection and other system parameters before initiating **firmwareDownload**. It may fail if at least one of the following conditions is encountered:

- The host is not reachable from the switch.
- The user does not have permission on the host.
- The password is not specified correctly.
- Indicated firmware does not exist on the host, or is not in the right format, or is corrupted.
- The FTP or SSH service is not running on the host.
- The platform is not supported by the firmware indicated.
- The USB device may not be plugged in correctly. On standalone switches, the device must be plugged into the switch USB port. On enterprise-class platforms, the USB device must be plugged into the Active CP
- The USB device is not enabled. Use the usbStorage command on the switch to enable the USB device. On enterprise-class platforms, the command must be run on the Active CP to enable the USB device.

For additional system messages, refer to the Fabric OS Message Reference.

EXAMPLES

To download the firmware to both CPs on a dual-CP chassis with an attached USB device (You would execute the same command on a single-CP switch with USB support. Output may vary depending on platform.):

```
switch:admin> firmwaredownload -U v7.0.0

Checking system settings for firmwaredownload...

Protocol selected: USB

Trying address-->AF_INET IP: 127.1.1.8, flags: 2

System settings check passed.

Checking version compatibility...

Version compatibility check passed.

This command will upgrade the firmware on both

CP blades. If you want to upgrade firmware on a single

CP only, please use -s option.

You may run firmwaredownloadstatus to get the status
```

```
of this command.

This command will cause a warm/non-disruptive boot on the active CP, but will require that existing telnet, secure telnet or SSH sessions sessions be restarted.
```

To download firmware interactively:

System settings check passed.

(Output truncated)

To download firmware without a password using public key authentication:

```
switch:admin> firmwaredownload
Server Name or IP Address: 10.38.17.17
User Name: admin
File Name: /users/home25/admin/dist
Network Protocol(1-auto-select, 2-FTP, 3-SCP, 4-SFTP) [1]: 3
Verifying if the public key authentication is available.
Please wait ...Success.

Do Auto-Commit after Reboot [Y]: y
Reboot system after download [N]: y
Server IP: 10.38.17.17, Protocol IPv4
Checking system settings for firmwaredownload...
```

SEE ALSO firmwareCommit, firmwareDownloadStatus, firmwareKeyShow, firmwareRestore, firmwareShow, reBoot, slotShow, version

firmwareDownloadStatus

Displays the status of a firmware download.

SYNOPSIS firmwaredownloadstatus

DESCRIPTION

Use this command to display an event log that records the progress and status of events during a firmware download. The event log is created by the firmware download process and is kept until you issue another **firmwareDownload** command. A timestamp is associated with each event. When downloading Fabric OS firmware, the event logs in the two control processors (CPs) are synchronized and you can run this command from either CP.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the status of a firmware download on a switch:

```
switch:admin> firmwaredownloadstatus
[1]: Tue Mar 29 21:43:14 2011
Firmware is being downloaded to the switch. This step may take up to 30 minutes.

[2]: Tue Mar 29 21:48:26 2011
Firmware has been downloaded to the secondary partition of the switch.

[3]: Tue Mar 29 22:06:57 2011
The firmware commit operation has started. This may take up to 10 minutes.

[4]: Tue Mar 29 22:10:19 2011
The commit operation has completed successfully.

[5]: Tue Mar 29 22:10:19 2011
Firmwaredownload command has completed successfully. Use firmwareshow to verify the firmware versions.
```

To display the status of a firmware download on a chassis:

```
switch:admin> firmwaredownloadstatus
[1]: Fri Mar 25 13:12:56 2011
Slot 7 (CP1, active): Firmware is being downloaded to the switch. This step
may take up to 30 minutes.

[2]: Fri Mar 25 13:33:23 2011
Slot 7 (CP1, active): Firmware has been downloaded to the secondary partition
of the switch.

[3]: Fri Mar 25 16:38:55 2011
Slot 7 (CP1, active): Firmwarerestore is entered. System will reboot and a
firmware commit operation will start upon boot up.

[4]: Fri Mar 25 16:49:12 2011
Slot 7 (CP1, standby): The firmware commit operation has started. This may
take up to 10 minutes.
```

```
[5]: Fri Mar 25 16:58:44 2011
Slot 7 (CP1, standby): Firmware commit operation has started to restore the secondary partition.
[6]: Fri Mar 25 16:58:45 2011
Slot 7 (CP1, standby): The firmware commit operation has started. This may take up to 10 minutes.
[7]: Fri Mar 25 17:05:34 2011
Slot 7 (CP1, standby): The commit operation has completed successfully.
```

SEE ALSO firmwareCommit, firmwareDownload, firmwareRestore, firmwareShow

firmwareKeyShow

Displays the public key used for signed firmware validation.

SYNOPSIS firmwarekeyshow

DESCRIPTION

This command displays the contents of the public key used for validating the integrity of firmware images when signed firmware validation is enabled.

NOTES

A firmware key should be installed on every switch as a part of the Fabric OS installation. The presence of a firmware key does not imply that the firmware signature is checked during **firmwareDownload**. Signed Firmware Download must be enabled before the public key can be used for signature validation.

Use the configure command to enable Signed Firmware Download.

If Signed Firmware Download is enabled, and if the validation succeeds, firmware download proceeds normally. If the firmware is not signed or if the signature validation fails, signed firmware download fails.

Refer to the Fabric OS Administrator's Guide for complete details on upgrading or downgrading firmware.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the public key used for signed firmware validation:

```
switch:admin> firmwarekeyshow
----BEGIN PUBLIC KEY----
MIGfMA0GCSqGSIb3DQEBAQUAA4GNADCBiQKBgQDjuQpMk4FrceFvVZ12iAakFNv9
k4ZGhFDMPGIHIems1Ywqdl55U7LTDIVwoViTLevtIDn012r1XlNQ+DORAzvJfkwD
XegkeTn/8wDgHBwotPz4WTd9UGJ9M0Vs52ro1TiukIpsh084LXKgxt+IgdseRCzY
8p8rQZWLpyputx6rgwIDAQAB
----END PUBLIC KEY----
```

SEE ALSO

firmwareDownload, configureChassis

firmwareRestore

Restores the former active firmware image.

SYNOPSIS firmwarerestore

DESCRIPTION

Use this command to restore the former active Fabric OS firmware image. This command can only be run if autocommit was disabled during the **firmwareDownload** process.

After a **firmwareDownload** and a **reboot** (with autocommit disabled), the downloaded firmware becomes active. If you do not want to commit the firmware and want to restore the former firmware, issue the **firmwareRestore** command. After running **firmwareRestore**, you can run **firmwareDownload** again.

This command reboots the system and makes the former firmware active. After the switch reboots, both primary and secondary partitions restore the previous firmware.

This command only takes action if the system is booted after a **firmwareDownload**; otherwise, the process terminates with an error.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To restore the former active firmware image:

```
switch:admin> firmwarerestore
Restore old image to be active ...
Restore both primary and secondary image after reboot.
The system is going down for reboot NOW !!
Broadcast message from root (ttyS0) Fri Oct 22 23:48:54 2010...
Doing firmwarecommit now.
Please wait ...
```

SEE ALSO firmwareCommit, firmwareDownload

firmwareShow

Displays the firmware version and download history.

SYNOPSIS fi

firmwareshow

firmwareshow --history

firmwareshow --help

DESCRIPTION

Use this command to display the firmware versions and the firmware download history. The command shows the firmware versions on both the primary and secondary partitions of the storage device. When this command is issued while a firmware download is in process, an appropriate warning message is displayed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--history

Displays the contents of the firmware download log. For each firmware download record, the command displays the date and time, the switch name, the slot number, port ID, and firmware version.

--help

Displays the command usage.

EXAMPLES

To display the firmware versions on a Brocade DCX 8510-8 while a firmware download is in progress:

swit	ch:adm	in> f :	irmwareshow			
Slot	Name	Appl	Primary/Secondary Ver	rsions	Status	
						-
6	CP0	FOS	v7.0.0		STANDBY	Z
			v7.0.0			
7	CP1	FOS	v7.0.0		ACTIVE	*
			v7.0.0			

WARNING: Firmwaredownload is in progress.

To display the firmware version on a standalone switch:

switch:a	dmin> firmwareshow
Appl	Primary/Secondary Versions
FOS	v7.0.0
	v7.0.0

To display the firmware download history:

```
switch:admin> firmwareshow --history
Firmware version history
```

SEE ALSO firmwareDownload, firmwareDownloadStatus

fmMonitor

Manages frame monitor configuration.

SYNOPSIS

fmmonitor --create frame type -pat bit pattern [-port port_list] [-highth value] [-action actions] [-timebase time base] [-nosave]

fmmonitor --delete frame_type

fmmonitor --show [frame_type] [-port port_list | -all] [-timeinterval interval]

fmmonitor --change frame_type [-pat bit_pattern] [-highth value] [-action actions][-timebase time_base]

fmmonitor --addmonitor frame type -port port list [-nosave]

fmmonitor --delmonitor frame_type [-port port_list] [-nosave]

fmmonitor --clear frame_type -port_port_list

fmmonitor --save frame type

fmmonitor --help

DESCRIPTION

Use this command to configure, install, and display frame monitors across port ranges on a switch. This command supports predefined and user-defined names for frame types defined by their offset, bit mask, and frame values. For each frame type you can configure a threshold and specify one or more alert mechanisms, such as RAS log, SNMP trap and email.

Frame monitors count the number of frames transmitted through a port that match specific values in the first 64 bytes of the frame. Because the entire Fibre Channel frame header and many upper protocol (for example, SCSI) headers fall within the first 64 bytes of a frame, frame monitors can detect different types of traffic transmitted through a port. Each frame monitor keeps a timestamp of its last refresh. It also keeps a generation count, which is incremented each time the monitor is cleared.

Frame monitors generate alerts whenever the frame count for a certain frame type crosses the threshold configured for that frame type. You can configure high thresholds for every frame type, specify actions to be taken when the threshold is exceeded, and configure how often the data are sampled. When you create a new frame type without specifying the events, a generic filter monitor configuration for generating events is applied.

The fmMonitor command supports basic Fabric Watch configurations for frame monitors. Use thConfig with the FILTER class for more advanced configurations.

When you create, add, or delete a monitor, the changes are saved persistently by default. Use the -nosave option with --create, --addmonitor, and --delmonitor to override the default behavior.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The number of monitors supported per port is platform-specific. Refer to the Fabric OS Administrator's Guide for more information.

This command requires an Advanced Performance Monitoring license. A Fabric Watch license is optional. Without a Fabric Watch license, you cannot use the alert mechanism, but you can still configure frame monitors and observe the counters.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, mirror ports, GbE ports, and FCoE ports.

OPERANDS

--create

Creates a user-defined frame type to be monitored. A frame type is defined by a unique name and bit pattern.

--change

Modifies an existing frame type configuration.

frame_type

Specifies a name for the frame type. The name is a user-defined string of up to 10 characters. Strings exceeding the character limit are truncated. The string must be included in double quotation marks. Spaces are not permitted. This operand is required with all configuration and display options.

Use the **--change** option to modify an existing frame type that you created earlier by changing, for example, the bit pattern, the ports where the frames should be monitored, or the alert mechanism. You can also use the **--change** option to modify one of the predefined frame types supported with this command. You can modify the ports where the frames should be monitored or change the default threshold and alert mechanism. You cannot change the bit pattern of a predefined frame type.

Predefined frame types include the following:

ABTS

Specifies a frame of type ABTS (Abort Sequence Basic Link Service command) with a bit pattern of "4,0xff,0x81:12,0xff,0x00: 20,0xff,0x00:"

BA_ACC

Specifies a frame of type BA_ACC (Abort Accept) with a bit pattern of "4,0xff, 0x84:12.0xff,0x00:"

ΙP

Specifies a frame of type IP with a bit pattern of "12,0xFF,0x05;".

SCSI

Specifies a frame of type SCSI with a bit pattern of "12,0xFF,0x08;".

SCSI READ

Specifies a frame of type SCSI Read with a bit pattern of "12,0xFF,0x08;4,0xFF,0x06; 40,0xFF,0x08,0x28;".

SCSI_WRITE

Specifies a frame of type SCSI Write with a bit pattern of "12,0xFF,0x08;4,0xFF,0x06; 40,0xFF,0x08,0x0A,0x2A;".

SCSI_RW

Specifies a frame of type SCSI Write with a bit pattern of "12,0xFF,0x08;4,0xFF,0x06; 40,0xFF,0x08,0x28,0x0A,0x2A;".

SCSI2 RESERVE

Specifies a frame of type SCSI-2 Reserve with a bit pattern of "12,0xFF,0x08;4,0xFF, 0x06;40,0xFF,0x16,0x56;".

SCSI3 RESERVE

Specifies a frame of type SCSI-3 Reserve with a bit pattern of "12,0xFF,0x08;4,0xFF,0x06; 40,0xFF,0x5F;41,0xFF,0x01;".

-pat bit_pattern

Specifies a unique combination of values in the first 64 bytes of a frame. The syntax for the bit patterns is as follows: "offset,bitmask, value;[offset,bitmask,value;] ...;" for example, "12,0xFF,0x08;4,0xFF,0x06;40,0xFF,0x08, 0x28;". This example monitors for SCSI read command traffic transmitted from a port by filtering on offset 12 with a value of 0x08 (SCSI-FCP), on offset 4 with value 0x06 (unsolicited command), and on offset 40 with values of 0x08 or 0x28 (read command). Each pattern must end with a semicolon (;) and the combined pattern must be enclosed in double quotation marks. This operand is required with the **--create** option. It is optional with the **--change** option.

The pattern components are as follows:

Offset

Specifies the offset within the frame. Offset 0 is the first byte of the start-of-frame (SOF) delimiter, and offset 4 is the first byte of the frame header. The offset must be in decimal format. Valid values for offset are 0, and 4 to 63. Offset 0 is a special case that can be used to monitor the first four bytes SOFx frames. The end-of--frame (EOF) delimiter cannot be monitored. A maximum of six offsets can be specified for each filter, and each offset can match up to four values. The count is incremented by one, if a frame has a matching value in all the offsets specified by the filter.

bitmask

Specifies the mask value to be applied to frame contents.

value

Specifies the values that need to be captured from the frame contents.

In SOFx frames the offset is specified as 0x0; The *value* is specified as one of the following. For example, the value of 0x6 matches frames of type SOFi3:

0 SOFf
1 SOFc1
2 SOFi1
3 SOFn1
4 SOFi2

i

SOFn2

6

SOFi3

7

SOFn3

-port port_list

Specifies one or more ports on which to install the monitor for the specified frame type. This operand is optional; if omitted, the monitor is installed on all eligible ports. A port list can consist of the following:

- One or more single ports, preceded by a slot number followed by a slash (/) on bladed systems. Multiple ports must be separated by a comma, for example, 8 or 5/8 or 3,5,8.
- One or more port ranges where the beginning and end port are separated by a dash, for example, 8-13 or 5/8-13, or 3/4-9. A port range cannot span multiple slots.

-highth value

Sets the high threshold value for the specified frame monitor. This operand is optional. High threshold values and defaults are platform-specific. Refer to the *Fabric Watch Administrator's Guide* for more information.

-timebase time_base

Specifies the time interval between two samples to be compared. Valid intervals include the following:

day

Samples are compared once a day.

hour

Samples are compared once every hour.

minute

Samples are compared once every minute.

-action value

Specifies the action triggered if the frame count for the specified frame type exceeds the configured high threshold. Valid actions include **snmp**, **raslog**, **portlog**, **email** or **none**. This operand is optional; if omitted, defaults are used (snmp, raslog). Note that **fmMonitor** only supports specification of high thresholds and the actions taken when the frame count exceeds the configured high threshold. Use the **thConfig** command with the filter class operand to configure and display other Fabric Watch thresholds, and the actions to be taken when the counters fall below or in-between configured Fabric Watch thresholds.

-nosave

Overrides the default behavior, which automatically saves the frame monitor and port configuration persistently when you create, modify, or delete a monitor. When you specify **-nosave**, the port configuration is not saved and will be erased upon reboot. However, the frame monitor configuration (type, bit pattern, thresholds etc.) will still be saved persistently. This operand is valid only with the **--create**, **--addmonitor**, and **--delmonitor** options. The CFG column in the show command display indicates "not saved" when **-nosave** is specified; otherwise it indicates "saved".

--save frame_type

Saves the set of ports on which the specified frame type is monitored to the persistent configuration. If a frame type is not specified, this command saves the port configurations of all existing frame types. This operation removes the configuration for ports not monitored.

--addmonitor frame_type -port_port_list

Installs an existing frame monitor on the specified ports.

--delmonitor frame_type -port port_list

Removes an existing frame monitor from the specified ports.

--delete frame_type

Deletes an existing frame type. This command removes the entire configuration, including configured threshold and associated actions. It also removes any frame monitors of the specified type from all ports. This operand is not valid with predefined frame types.

--clear frame_type -port port_list

Clears the ports on which the specified frame type is monitored from the persistent configuration.

--show

Displays the specified frame type configuration. When used without operand, the **--show** command displays the configured frame types along with their bit patterns. The following operands are optional:

frame_type

Displays the following information for the specified frame type: Port number, Frame type, frame count, configured high threshold, configured alerts, time base and configuration status (saved or N/A). The count field displays one of the following:

- A decimal number indicates the number of frames of the specified type.
- N/A indicates that a frame monitor configuration exists, but it is not assigned to any specific port.
- A dash ("-") indicates that a frame monitor is not installed on the port, but there is a configuration for frame monitor on these ports.

This operand is optional; if omitted, this command lists all configured frame types on the switch along with their bit patterns. The following operands are exclusive.

-port port_list

Specifies the ports for which to display the frame type configurations. Refer to the description above for valid values.

all

Displays information for all ports and frame types.

-timeinterval interval

Displayed the number of frames per second captured by the monitor during the specified time interval. Values are in seconds.

--help

Displays the command usage.

EXAMPLES

To create a custom frame type using default thresholds and report actions: The following custom frame monitor checks all incoming frames at offset 17, applies a mask of 0x0FF to the byte, and looks for a matching value of 0x07. It also monitors the incoming frames at offset 7, applies a mask of 0x0FF to the byte, and looks for matching values of 0x4F or 0x01. The counter is incremented when the monitor detects a frame where byte 17 is 0x07, and byte 7 is 0x4F or 0x01. The thresholds, alerting mechanism, action and threshold level for this custom frame type will be imported from a generic filter monitor configuration.:

```
switch:admin> fmmonitor --create MyFrameMonitor \
-pat "17,0x0FF,0x07;7,0x0FF,0x4F,0x01"
```

To add E-mail alerts to the previously created frame type:

```
switch:admin> fmmonitor --change MyFrameMonitor \
   -action email
```

To install a SCSI frame monitor on ports 3-12:

```
switch:admin> fmmonitor --addmonitor SCSI -port 3-12
```

To save the port configuration persistently:

```
switch:admin> fmmonitor --save SCSI
```

To delete the custom frame monitor "MyFrameMonitor" from all ports:

```
switch:admin> fmmonitor --delmonitor MyFrameMonitor
```

To delete the entire frame type configuration:

```
switch:admin> fmmonitor --delete MyFrameMonitor
```

To clear the counters for the SCSI2_READ monitor from ports 7-10:

```
switch:admin> fmmonitor --clear SCSI2_READ -port 7-10
```

To display the existing frame types and associated bit patterns on the switch:

```
switch:admin> fmmonitor --show
FRAME_TYPE BIT PATTERN
        scsi 12,0xFF,0x08;
    scsiread 12,0xFF,0x08;4,0xFF,0x06;\
              40,0xFF,0x08,0x28;
   scsiwrite 12,0xFF,0x08;4,0xFF,0x06;\
              40,0xFF,0x08,0x28,0x0A,0x2A;
      scsirw 12,0xFF,0x08;4,0xFF,0x06;\
              40,0xFF,0x08,0x28,0x0A,0x2A;
 scsi2reserve 12,0xFF,0x08;4,0xFF,0x06;\
              40,0xFF,0x16,0x56;
 scsi3reserve 12,0xFF,0x08;4,0xFF,0x06;\
              40,0xFF,0x5F;41,0xFF,0x01
          ip 12,0xFF,0x05;
        abts 4,0xFF,0x81;40,0xFF,0x81;\

       baacc 4,0xff,0x84;12,0xff,0x00;17,0xff,00;
```

To display configuration details for the predefine SCSI frame monitor (Use **thConfig** filter class to set and display other Fabric Watch thresholds for frame monitors):

```
switch:admin> fmmonitor --show scsi
```

Port	Frame	Type C	ount HIG	HThres	Actions	TIMEBA	SE CFG
			00000123		Raslog	None	saved
000003	scsi 00	000000	00000124	10	Raslog	None	saved
000004	scsi 00	000000	00000143	10	Raslog	None	saved

To display all configured frame types for all ports:

```
switch:admin> fmmonitor --show all
```

Port Frame Type	Count	HIGH	Actions	TIMEBAS	E CFG
		Thres			
000062 scsi	0000000000000123	10	Raslog	None	saved

SEE ALSO portThConfig, thConfig

fosConfig

Displays or modifies Fabric OS features.

SYNOPSIS

fosconfig --enable feature

fosconfig --disable feature

fosconfig --show

DESCRIPTION

Use this command to enable or disable a feature, or to display the current operating status of features on a switch. This command can be run while the switch is online.

The following features are supported (refer to the Notes for limitations):

- FC Routing service (see fcrConfigure)
- iSCSI service (not supported in Fabric OS v7.0.0 and later).
- iSNS client service (not supported in Fabric OS v7.0.0 and later).
- Virtual Fabrics (see IfCfg and IsCfg)
- Ethernet switching service

NOTES

The features described may not be supported on all platforms. If you attempt to enable a feature that is not supported on your platform, an error message stating "Command not supported on this platform" is displayed.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--enable feature

Enables a feature on the switch. Valid values for *feature* include the following:

fcr

Enables the FC Routing service on the switch. The FC Routing service is disabled by default. Use **fosConfig --show** to determine if FCR is enabled or disabled,

When enabling FCR, you may encounter one of the following system messages:

"FC Routing service is in the process of being disabled, please try again after a few minutes." This means that a command to disable the FC Routing service is still in progress. Wait a few minutes and try again.

"FC Routing service is already enabled." This means that the FC Routing service is already enabled.

iSCSI

Not supported in Fabric OS v7.0.0 and later.

iSNSC

Not supported in Fabric OS v7.0.0 and later.

νf

Enables Virtual Fabrics. By default, Virtual Fabrics are disabled. Before enabling the Virtual Fabrics, ensure that there are no Administrative Domains (ADs) in effect. Administrative Domains must be disabled before enabling Virtual Fabrics. This command prompts for confirmation, because the chassis reboots after this command is executed.

ethsw

Enables the Ethernet switch service on the switch. The Ethernet switch service is disabled by default. Enabling the Ethernet switch service does not disrupt the FC traffic.

--disable feature

Disables a feature on the switch. Valid values for *feature* include the following:

fcr

Disables the FC Routing service on the switch. All enabled EX_Ports and VEX_Ports on the switch must be offline for this command to succeed.

To use this command to disable the FC Routing service only instead of disabling the switch, issue this command, then change the BB fabric ID using fcrConfigure.

When disabling the FCR service, you may encounter the following system messages:

"Please disable all EX/VEX_Ports first before running this command." This means that there were EX Ports or VEX Ports online when this command was issued. Take these ports offline and try the command again.

"FC Routing service is already disabled" -This means that the FC Routing service is already disabled.

iSCSI

Not supported in Fabric OS v7.0.0 or later.

iSNSC

Not supported in Fabric OS v7.0.0 or later.

νf

Disables Virtual Fabrics on the switch. This command prompts for confirmation, because the chassis reboots after this command is executed.

ethsw

Disables the Ethernet switch service. Ethernet switching is disabled by default. This operation reboots the switch and is therefore disruptive.

--show

Displays the current operating status of features on the switch.

EXAMPLES

To display the operating status of the services on a Brocade 6510:

switch:admin> fosconfig --show

FC Routing service: disabled

iSCSI service: Service not supported on this Platform iSNS client service: Service not supported on this Platform

Virtual Fabric: enabled

Ethernet Switch Service: Service not supported on this Platform

To disable the FC Routing service:

```
switch:admin> fosconfig --disable fcr
FC Routing service is disabled
```

To enable the FC Routing service:

```
switch:admin> fosconfig --enable fcr
FC Routing service is enabled
```

To enable Virtual Fabrics:

```
switch:admin> fosconfig --enable vf
WARNING: This is a disruptive operation that \
   requires a reboot to take effect.
All EX ports will be disabled upon reboot.
Would you like to continue [Y/N]y
```

To disable Virtual Fabrics:

```
switch:admin> fosconfig --disable vf
WARNING: This is a disruptive operation that \
   requires a reboot to take effect.
Would you like to continue [Y/N]y
```

To enable the Ethernet Switching service:

```
switch:admin> fosconfig --enable ethsw
WARNING: This operation will enable the \
    Ethernet Switch Service on this switch.
Would you like to continue [Y/N]: y
Enabling the Ethernet Switch Service. Please wait ...
Create Ethernet switch instance 0
All service instances in sync.
The Ethernet Switch Service has been enabled.
Please enable all of the Blades with ID 74 now.
```

To disable the Ethernet Switching service:

```
switch:admin> fosconfig --disable ethsw
WARNING: This is a disruptive operation that \
    requires a reboot to take effect.
Would you like to continue [Y/N]: y
The Ethernet Switch Service has been disabled.
Your system is being rebooted now.
The system is coming up, please wait...
```

SEE ALSO fcrConfigure, switchShow

fosExec

Executes a command in a specified logical switch context.

SYNOPSIS

```
fosexec --fid FID -cmd "cmd [args]"
```

fosexec --fid all [-force] -cmd "cmd [args]"

DESCRIPTION

Use this command to execute any Fabric OS command on a specified logical switch context or on all logical switches. The target logical switch is identified by its fabric ID (FID). When used with the --fid all option, the specified command is executed in all logical switches.

The FIDs must be part of the FID permission list associated with the user account. If you execute fosexec --fid all and you do not have permission to one or more of the logical switches (FIDs), the command prompts for confirmation to continue with the execution of the command in the FIDs for which you do have permission. You can override the prompt for confirmation with the -force option. Refer to userConfig help for more information on logical switch access permissions.

Executing chassis-level commands through fosexec --fid all results in redundant output.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--fid FID

Specifies the Fabric ID of the logical switch for which the command is executed.

--fid all

Executes the specified command in all logical switch contexts configured on the

physical switch.

-force

Executes the specified command on all logical switches in your permission list

without prompting for confirmation.

-cmd "cmd [args]"

Specifies the command to be executed including command options if applicable.

The entire command string must be enclosed in double quotation marks.

EXAMPLES

To display switch information for a logical switch with FID 10:

```
switch:admin> fosexec --fid 10 -cmd "switchshow"
"switchshow" on FID 10
            switch_10
switchName:
switchType:
              66.1
switchState:
               Online
switchMode:
               Native
switchRole:
               Subordinate
switchDomain:
switchId:
               fffc01
               10:00:00:05:1e:41:5f:c2
switchWwn:
               ON (lsan_cfg)
zoning:
switchBeacon:
              OFF
FC Router:
               OFF
Allow XISL Use: ON
LS Attributes: [FID: 10, Base Switch: No, \
```

Det	tault	Swite	ch: No, 1	Address	s Mode	0]	
Index	Slot	Port	Address	Media	Speed	State	Proto
=====				======			
0	1	0	640000		N8	No_Module	FC
1	1	1	640100		N8	No_Module	FC
2	1	2	640200		N8	No_Module	FC

To enable port 5/0 on all logical switches:

```
switch:admin> fosexec --fid all -cmd "portenable 5/0"

"portenable" on FID 128:

"portenable" on FID 10:

A port or ports is/are not part of this switch.

"portenable" on FID 20:

A port or ports is/are not part of this switch.
```

To display the firmware version for all logical switches:

```
switch:user> fosexec --fid all -cmd "firmwareshow -v"
LF permission does not exist for one or more \
  logical switches.
Would you like to continue [Y/N]: y
_____
"firmwareshow" on FID 10:
Appl Primary/Secondary Versions
FOS
     v7.0.0
      v7.0.0
_____
"firmwareshow" on FID 20:
    Primary/Secondary Versions
FOS
     v7.0.0
      v7.0.0
```

To display the switch name for all logical switches without confirmation:

```
switch:user> fosexec --fid all -force -cmd "switchname"
"switchname" on FID 10:
switch_10
_____
"switchname" on FID 20:
switch_20
```

SEE ALSO setContext, userConfig

frameLog

Displays information about discarded frames.

SYNOPSIS framelog -- disable

framelog --enable

framelog --clear

framelog --show [-txport [slot/]port]
[-rxport [slot/]port]
[-sid source_PID][-did destination_PID]
[-sfid fabric_ID] [-dfid fabric_ID>]
[-mode summary | dump] [-n num_items]

DESCRIPTION

Use this command to disable or re-enable the frame log, and to display detailed information about the discarded frames logged by the frame log. The frame log stores information about frames discarded due to certain reasons. The only discard reason currently supported is timeout.

When frame drops occur on a switch, the frame log can help you identify to which flows the dropped frames belong and zero in on the affected applications by finding out the end-points of the dropped frame.

Use the **--show** option to display detailed information about the discarded frames that match the filter criteria provided by this command. The **--show** option supports two viewing modes: summary and dump mode. In summary mode, the command aggregates similar frames (those that have the same log timestamp, TX port, RX port, SID, DID, SFID and DFID) without displaying the raw frame contents. In dump mode, the command displays the raw frame contents, but the frames are not aggregated in the manner of the summary mode. In either mode, you can specify additional filters to customize the number and properties of the frames for closer examination.

When viewed in summary mode, the frame log displays the following information:

Log timestamp

The date and time when the frames described in this line of output were discarded. This value is accurate to within one second, that is, the displayed frames were not necessarily dropped at precisely the same time.

TX port

Egress port where the frames were bound to exit the chassis. A port displayed as

-1 (or -1/-1 on slot-based systems) indicates an internal port.

RX port

Ingress port where the frames entered the chassis. A port displayed as -1 (or -1/-1

on slot-based systems indicates an internal port.

SID

Source port ID in hexadecimal PID format.

DID

Destination port ID in hexadecimal PID format.

SFID

Source Fabric ID

DFID

Destination Fabric ID

Type

Reason for the frame discard. Frames can be discarded for a variety of reasons.

The only discard reason currently handled by the frame log is timeout.

Count

The number of discarded frames logged in the frame log that have the log timestamp, TX port, RX port, SID, DID, SFID and DFID values listed on this line of output. Note that this count may be less than the actual number of such frames discarded, because the frame log cannot log the details of all discarded frames.

When viewed in dump mode, the frame log displays the following information:

Log timestamp

The date and time when the frames described in this line of output were

discarded.

TX port

Egress port where the frames were bound to exit the chassis. A port displayed as

-1 (or -1/-1 on slot-based systems) indicates an internal port.

RX port

Ingress port where the frames were bound to enter the chassis. A port displayed

as -1 (or -1/-1 on slot-based systems indicates an internal port.

Type

Reason for the frame discard. Frames can be discarded for a variety of reasons.

The only discard reason currently handled by the frame log is timeout.

Frame contents

The first 64 bytes of the frame contents in hexadecimal format.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The Frame Log operation is chassis-wide.

OPERANDS

This command has the following operands:

--disable

Disables logging of discarded frames, which is enabled by default. This command clears the history of discarded frames and gathering of new information ceases. When frame logging is disabled, only the **--help** and **--enable** operations are permitted.

--enable

Enables logging of discarded frames after the feature was disabled.

--clear

Clears the stored history of discarded frames. This operation is permitted only

when the feature is enabled.

--show

Prints a listing of details about stored frames that match the specified filter criteria. This operation is permitted only when the feature is enabled. You can specify one or more of the following options to filter the output. When used without operands, the **--show** command displays the unfiltered output.

-txport [slot/]port

Displays only the frames that were bound to exit by the specified egress port.

-rxport [slot/]port

Displays only the frames that entered the chassis on the specified port.

-sid source_PID

Displays only the frames with the specified 24-bit source address in the FC header. The port ID (PID) must be written in hexadecimal and must be prefixed by 0x.

-did destination PID

Displays only the frames with the specified 24-bit destination address in the FC header. The port ID (PID) must be written in hexadecimal and must be prefixed by 0x.

-sfid fabric_ID

Displays only the frames with the specified fabric ID as the source fabric ID.

-sdfid fabric_ID

Displays only the frames with the specified fabric ID as the destination fabric ID.

-mode summary | dump

Specifies the command output mode. In dump mode, the command prints the 64 bytes of frame contents. In summary mode, the frame contents are not displayed. Summary mode is the default.

-n num_items

Displays the specified number of items. In summary mode, an item is a record of frames with the same values of log timestamp, TX port, RX port, SID, DID, SFID and DFID. Note that more frames may be represented in the lines of output than specified in the *num_items* value, because one line can aggregate multiple frames in summary mode. In dump mode, each item represents a single frame. The default value of *num_items* is 20. The maximum value in summary mode is 1200, and in dump mode it is 12,000.

EXAMPLES

To display eight lines of an unfiltered frame log view in summary mode:

switch:user> framelogshow -mode summary -n 8									
Mon Jan 31 23:54:59 UTC 2011									
Log	TX	RX							
timestamp	port	port	SID	DID	SFID	DFID	Type	Count	
==========	=====		=======						
Jan 31 23:49:37	2	2	0xfffffd	0 x f f f f f d	1	1	timeout	1	
Jan 31 23:49:37	2	1	0×051500	0x060100	1	1	timeout	4	
Jan 31 23:49:37	2	0	0×051700	0x060000	1	1	timeout	4	
Jan 31 23:49:36	2	1	0×051500	0x060100	1	1	timeout	3	
Jan 31 23:49:36	2	0	0x051700	0x060000	1	1	timeout	3	
Jan 31 23:49:35	2	1	0x051500	0x060100	1	1	timeout	2	

To display the frame contents in dump mode:

switch:user> framelog --show -mode dump -n 4

```
Jan 31 18:34:46 7/32 7/33 timeout
       00 03 a0 00 00 03 a1 00 00 28 00 00 00 00 00 00
       Jan 31 18:34:46 7/32 7/33 timeout

       Jan 31 18:34:46 7/32 7/33 timeout
       00 03 a0 00 00 03 a1 00 00 28 00 00 00 00 00 00
```

SEE ALSO None

fspfShow

Displays Fabric Shortest Path First (FSPF) protocol information.

SYNOPSIS

fspfshow

DESCRIPTION

Use this command to display FSPF protocol information and internal data structures of the FSPF module. The command displays the following fields:

version

Version of the FSPF protocol.

domainID

Domain number of the local switch.

switchOnline

State of the local switch.

domainValid

TRUE if the domain of the local switch is currently confirmed.

isl_ports

Bit map of all ISL ports. Bit positions correspond to the default areas of the ports. Bit 0 refers to default area of the switch, bit 1 refers to default area 1, and so forth.

trunk_ports

Bit map of all trunk slave ports.

f_ports

Bit map of all FX_Ports.

seg_ports

Bit map of all segmented ports.

active_ports

Bit map of all online ports.

minLSArrival

FSPF constant.

minLSInterval

FSPF constant.

LSoriginCount

Internal variable.

startTime

Start time of the FSPF task from boot time, in milliseconds.

fspfQ

FSPF input message queue.

fabP

Pointer to fabric data structure.

agingTID

Aging timer ID.

agingTo

Aging time out value in milliseconds.

IsrDlyTlD

Link State Record delay timer ID.

IsrDelayTo

Link State Record delay time out value in milliseconds.

IsrDelayCount

Counter of delayed Link State Records.

ddb_sem

FSPF semaphore ID.

event_sch

FSPF scheduled events bit map.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display FSPF protocol information:

switch:admin> fspfshow

fwAlarmsFilterSet

Enables or disables alarms for Fabric Watch.

SYNOPSIS fwalarmsfilterset [mode]

DESCRIPTION Use this command to configure alarm filtering for Fabric Watch. By turning off the alarms, all

nonenvironment class alarms are suppressed. By turning on the alarms, all class alarms are generated.

NOTES This command requires a Fabric Watch license.

> The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

mode

Specify 1 to enable the alarms, 0 to disable the alarms. If no operand is specified, the default value is 0 (alarms deactivated). This operand is optional; if omitted, this

command disables the alarms.

EXAMPLES To enable alarms in Fabric Watch:

> switch:admin> fwalarmsfilterset FW: Alarms are already disabled

switch:admin> fwalarmsfilterset 1 FW: Alarms are already enabled

SEE ALSO fwAlarmsFilterShow

fwAlarmsFilterShow

Displays alarm filtering for Fabric Watch.

SYNOPSIS fwalarmsfiltershow

DESCRIPTION Use this command to display whether alarm filtering is enabled or disabled.

NOTES This command requires a Fabric Watch license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the status of alarm filtering in Fabric Watch:

switch:user> fwalarmsfiltershow

FW: Alarms are enabled

switch:user> fwalarmsfiltershow

FW: Alarms are disabled

SEE ALSO fwAlarmsFilterSet

fwClassInit

Initializes all classes under Fabric Watch.

SYNOPSIS fwclassinit

DESCRIPTION Use this command to initialize all classes under Fabric Watch. The command should only be used after

installing a Fabric Watch license to start licensed Fabric Watch classes. Refer to the Fabric Watch

Administrator's Guide for a list of supported Fabric Watch classes.

NOTES This command requires a Fabric Watch license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To initialize all classes under Fabric Watch:

switch:admin> fwclassinit

fwClassInit: Fabric Watch is updating... fwClassInit: Fabric Watch has been updated.

SEE ALSO fwConfigReload, fwHelp, portFencing, portThConfig, thConfig, sysMonitor

fwConfigReload

Reloads the Fabric Watch configuration.

SYNOPSIS fwconfigreload

DESCRIPTION Use this command to reload the Fabric Watch configuration. This command should only be used after

downloading a new Fabric Watch configuration file from a host.

NOTES This command requires a Fabric Watch license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To reload the saved Fabric Watch configuration:

switch:admin> fwconfigreload

fwConfigReload: Fabric Watch configuration reloaded

SEE ALSO configDownload, configUpload, fwClassInit, fwHelp

fwFruCfg

Displays or modifies FRU state alert configuration.

SYNOPSIS

fwfrucfq [--show]

DESCRIPTION

Use this command to configure states and actions for field-replaceable units (FRUs) and small form-factor pluggables (SFPs). Based on these configuration settings, Fabric Watch generates actions when a FRU or SFP state changes. For SFPs, Fabric Watch monitors state changes in following events: SFP inserted, SPP removed, SFP faulty. When used without operand, this command interactively prompts for user input. To configure email alerts, use fwMailCfg. This command is not applicable to platforms that do not support FRUs or SFPs.

NOTES

This command requires a Fabric Watch license.

The OFF state (8) is only applicable to FANs on the Brocade DCX and DCX-4S chassis and on the Brocade 5300 switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

--show

Displays the current FRU configuration setting. This operand is optional; if omitted, the configuration prompt displays.

EXAMPLES

To change the FRU state alert configuration:

switch:admin> fwfrucfg

The current FRU configuration:

		Alarm	State	Alarm Action
	Slot		1	1
Power	Supply		1	1
	Fan		1	1
	WWN		1	1
	SFP		0	0

Note that the value 0 for a parameter means that it is NOT used in the calculation

```
Configurable Alarm States are:
Absent-1, Inserted-2, On-4, Off-8, Faulty-16
```

```
Configurable Alarm Actions are:
Errlog-1, E-mail-16
Slot Alarm State: (0..31) [1]
Slot Alarm Action: (0..17) [1]
Power Supply Alarm State: (0..31) [1]
Power Supply Alarm Action: (0..17) [1]
Fan Alarm State: (0..31) [1]
Fan Alarm Action: (0..17) [1]
```

```
WWN Alarm State: (0..31) [1]
WWN Alarm Action: (0..17) [1]
SFP Alarm State: (0..19) [0]
SFP Alarm Action: (0..17) [0]
Fru configuration left unchanged
```

SEE ALSO fwHelp, fwMailCfg, sfpShow

fwHelp

Displays Fabric Watch command information.

SYNOPSIS fwhelp

DESCRIPTION Use this command to display the commands that configure Fabric Watch.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

fwMailCfg

Displays and configures Fabric Watch email alerts.

SYNOPSIS fwmailcfg

DESCRIPTION

Use this command to display or modify the configuration and status of the Fabric Watch email alert on the switch.

Switch elements monitored by Fabric Watch are divided into classes, and e-mail alerts are based on the classes. Each class can configure up to five e-mail addresses as the alert message's receiver. Multiple e-mail addresses must be separated by a comma. The e-mail addresses must conform to standard syntax *string@domain.suffix*. Default domains are not automatically appended. Invalid e-mail addresses are rejected. "NONE" is the default address and a valid input parameter.

In Access Gateway mode, only the following classes are supported.

- Environment class
- SFP class
- Port class
- F/FL Port (Optical) class
- F/FL Port (Copper) class (embedded platforms only)
- Resource class

For an e-mail alert to function correctly, add the CP0 and CP1 IP addresses and host names to DNS and also set the domain name and name server. The **ipAddrShow** and **dnsConfig** commands can be used to set and verify this information.

NOTES

This command requires a Fabric Watch license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To configure email settings:

```

fwPortDetailShow

Displays the port information for specified user ports.

SYNOPSIS fwportdetailshow [--p port] | [--s portState]

DESCRIPTION

Use this command to print the overall status of a specified port. The output of this command is different for IPv4 and IPv6 addresses. The overall status is calculated based on the following contributors:

Port Errors

LFA

The number of link loss occurrences exceeding the limit for the time period.

LSY

The number of sync loss occurrences exceeding the limit for the time period.

LSI

The number of signal loss occurrences exceeding the limit for the time period.

PER

The number of protocol errors exceeding the limit for the time period

INW

The number of invalid words exceeding the limit for the time period

CRC

The number of invalid CRC errors exceeding the limit for the time period

PSC

The port hardware state changed too often.

BLP

Buffer limited port

SFP Errors

STM

The SFP temperature is out of range.

SRX

The SFP receive power is out of range.

STX

The SFP transmit power is out of range.

SCU

The SFP current is out of range.

SVO

The SFP voltage is out of range.

Overall status

Healthy

Every contributor is healthy.

Marginal

One or more contributors are in this status.

Faulty

Faulty hardware.

Offline

The port has no connectivity or is disabled.

If the overall status is not healthy, the contributing factors also are listed.

When used without operands, this command displays information for all ports.

NOTES This command requires a Fabric Watch license.

Port errors are not supported for virtual ports and SFP errors are not applicable for virtual ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

```
--p port
```

Displays a port detail report for the specified port.

--s portState

Displays a port detail report for the specified portState. Valid portState entries

include the following:

h

Report based on all healthy ports.

m

Report based on all marginal ports.

f

Report based on all faulty ports.

0

Report based on all offline ports.

EXAMPLES

To retrieve a port detail report for a switch configured with an IPv6 address:

```
switch:user> fwportdetailshow
Port Detail Report
  Report time: 09/11/2006 05:51:15 PM
Switch Name: switch
IP address: 1080::8:800:200C:417A
Port Exception report [by All]
       -----Port-Errors-----
Port# Type State Dur(H:M) LFA LSY LSI PER INW \
_____\
000
     U OFFLINE 080:24 -
     E HEALTHY 073:22 - - -
001
     L HEALTHY 080:24 - - - - - - U OFFLINE 080:24 - - - - -
002
003
     U OFFLINE 002:53
004
   ----SFP-Errors----
CRC PSC BLP STM SRX STX SCU SVO
(output truncated)
```

To retrieve a port detail report for all ports in healthy state:

```
switch:user> fwportdetailshow --s h
Port Detail Report
                   \
   Report time: 05/21/2007 11:22:58 PM
Switch Name: switch
IP address: 192.168.163.237
Port Exception report [by Healthy]
-----Port-Errors-----
Port# Type State Dur(H:M) LFA LSY LSI PER INW \
______
001 F HEALTHY 409:09 - - - - \
014 F HEALTHY 409:09 - - - - \
015 E HEALTHY 409:09 - - - - \
  ----SFP-Errors----
CRC PSC BLP STM SRX STX SCU SVO
```

SEE ALSO switchStatusShow

fwSamShow

Generates switch availability monitor (SAM) report.

SYNOPSIS

fwsamshow

DESCRIPTION

Use this command to display a switch availability monitor (SAM) report. This report displays uptime and downtime for each port and enables you to check if a particular port is failing more often than the others. The information displayed includes total uptime, total downtime, number of faulty occurrences, and total percent of downtime for each port.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command requires a Fabric Watch license.

OPERANDS

None

EXAMPLES

To generate a SAM report on an eighty-port switch:

switch:	user>	fwsamshow

portShow, switchShow

fwSet

Sets port persistence time.

SYNOPSIS fwset --port --persistence seconds

DESCRIPTION Use this command to set port persistence time, a parameters controlled by Fabric Watch. Port

> persistence time specifies the time in seconds during which a port must persistently be in a marginal state before being labeled as such. port persistence is a switch-wide parameter. Use portThconfig to

display port persistence time.

NOTES This command requires a Fabric Watch license.

> The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

--port --persistence seconds

Specifies the time, in seconds, during which a port must be persistently in a

marginal state before being recognized as such.

EXAMPLES To set the port persistence time to 18 seconds:

switch:user> fwset --port --persistence 18

SEE ALSO fwHelp, portThConfig

fwSetToCustom

Sets Fabric Watch thresholds and alarm levels to custom values.

SYNOPSIS fwsettocustom

DESCRIPTION

Use this command to set threshold and alarm levels to custom values for all Fabric Watch classes and areas.

Fabric Watch uses two types of settings: factory default settings and user-defined custom settings.

- Factory default settings are automatically enabled. These settings vary depending on hardware platform, and cannot be modified.
- For some Fabric Watch parameters, you can create custom configurations to suit your unique environment.

The **fwSetToCustom** command allows you to switch from default to custom settings. The command assumes that a set of user-defined thresholds have been configured prior to executing the **fwSetToCustom** command. If no user-defined settings exist, this command reapplies the default values.

Use the advanced configuration option provided with the **portThConfig**, **thConfig**, and **sysMonitor** commands to view and modify custom and default values for specified classes and areas in Fabric Watch. For specific configuration procedures, refer to the *Fabric Watch Administrator's Guide*.

NOTES

This command requires a Fabric Watch license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To apply configured custom settings to all Fabric Watch classes and areas:

```
switch:admin> fwsettocustom
Committing configuration...done.
```

To view the current Fabric Watch configuration for the environment class:

```
switch:admin> sysmonitor --show env

SEE ALSO fwSetToDefault, fwHelp, portThConfig, thConfig, sysMonitor

fwSetToDefault

Returns Fabric Watch thresholds and alarm levels to default values.

SYNOPSIS fwsettodefault

DESCRIPTION

Use this command to return Fabric Watch thresholds and alarm levels to defaults for all classes and areas in Fabric Watch.

Fabric Watch uses two types of settings: factory default settings and user-defined custom settings.

- Factory default settings are automatically enabled. These settings vary depending on hardware platform and cannot be modified.
- For some settings, you can create custom threshold configurations to suit your unique environment.

The **fwSetToDefault** command reapplies the Fabric Watch default configuration for all classes and areas. Use the advanced configuration option provided with the **portThConfig**, **thConfig**, and **sysMonitor** commands to view and modify custom and default values for specified classes and areas in Fabric Watch. For specific configuration procedures, refer to the *Fabric Watch Administrator's Guide*.

NOTES

This command requires a Fabric Watch license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To return alarm levels to default values:

```
switch:admin> fwsettodefault
Committing configuration...done.
```

To view the current Fabric Watch configuration for the environment class:

```

h

Displays shell history.

SYNOPSIS I

history

DESCRIPTION Use this command to view the shell history. The shell history mechanism is similar to the UNIX shell

history facility. The h command displays the 20 most recent commands typed into the shell; the oldest

commands are replaced as new ones are entered.

OPERANDS None

EXAMPLES To display previous shell commands:

switch:admin> h
1 version
2 switchshow
3 portdisable 2
4 portenable 2
5 switchshow

SEE ALSO None

haDisable

Disables the High Availability feature.

SYNOPSIS hadisable

DESCRIPTION Use this command to disable the High Availability (HA) feature on a switch. If the HA feature is already

disabled, this command does nothing.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To disable the High Availability feature:

switch:admin> hadisable

HA is disabled

SEE ALSO haEnable, haShow

haDump

Displays High Availability status information.

SYNOPSIS

hadump

DESCRIPTION

Use this command to display information about the status of the High Availability (HA) feature on a switch or a chassis. This command displays the following information:

- Time Stamp
- Local CP state (slot number and CP ID)
- Remote CP state (slot number and CP ID)
- Type of recovery (warm or cold)
- High Availability (enabled or disabled)
- Heartbeat (up or down)
- Health of standby CP
- HA synchronization status
- IP and Fibre Channel addresses configured for the switch or chassis.
- Additional internal HA state information, subject to change.

The health of the standby CP is defined as follows:

Healthy

The standby CP is running and the background health diagnostic has not detected any errors.

Failed

The standby CP is running, but the background health diagnostic has discovered a problem with the blade. Check the logs to determine an appropriate course of action. Failover is disabled until the standby CP is repaired. Information about the failing device in the standby CP is displayed.

Unknown

The standby CP health state is unknown because the standby CP does not exist, heartbeat is down, or Health Monitor detects a configuration file error.

The High Availability synchronization status is defined as follows:

HA State synchronized

The system is currently fully synchronized. If a failover becomes necessary, it is nondisruptive.

HA State not in sync

The system is unable to synchronize the two control processors (CPs) because the standby CP is faulty, an **haSyncStop** command was issued, or a system error occurred. If a failover becomes necessary at this time, active CP reboots and the failover is disruptive.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To view information about the High Availability feature status on a Brocade DCX 8510-8:

```
switch:admin> hadump
_____
TIME_STAMP: Mar 30 12:57:35.109173
_____
Local CP (Slot 7, CP1): Active, Warm Recovered
Remote CP (Slot 6, CP0): Standby, Healthy
HA enabled, Heartbeat Up, HA State synchronized
CHASSIS
Ethernet IP Address: 10.20.114.57
Ethernet Subnetmask: 255.255.240.0
CP0
Ethernet IP Address: 10.20.114.58
Ethernet Subnetmask: 255.255.240.0
Host Name: cp0
Gateway IP Address: 10.20.112.1
CP1
Ethernet IP Address: 10.20.114.59
Ethernet Subnetmask: 255.255.240.0
Host Name: cp1
Gateway IP Address: 10.20.112.1
Backplane IP address of CPO : 10.0.0.5
Backplane IP address of CP1: 10.0.0.6
IPv6 Autoconfiguration Enabled: Yes
Local IPv6 Addresses:

== Config ==
(Output truncated)
```

SEE ALSO haFailover, haShow

haEnable

Enables the High Availability feature.

SYNOPSIS

haenable

DESCRIPTION

Use this command to enable the High Availability (HA) feature on a switch. If the HA feature is already enabled, this command has no effect.

If the HA feature is disabled, this command enables it. The standby CP reboots as part of the process. The command displays a warning message and prompts for confirmation before rebooting the CP.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To enable the High Availability feature on a Brocade DCX 85120-8:

```
switch:admin> haenable Warning: This command will enable the HA. It will reboot the standby CP and require all telnet, secure telnet, and SSH sessions to the standby CP to be restarted Are you sure you want to go ahead [y/n]?y
```

To verify that High Availability is enabled:

```
switch:admin> hashow
  Local CP (Slot 7, CP1): Active, Warm Recovered
Remote CP (Slot 6, CP0): Standby, Healthy
HA enabled, Heartbeat Up, HA State synchronized
```

SEE ALSO

haDisable, reBoot

haFailover

Forces the failover mechanism so that the standby control processor (CP) becomes the active CP.

SYNOPSIS hafailover

DESCRIPTION

Use this command to force the failover mechanism to occur so that the standby CP becomes the active CP. In case the active and standby CPs are not synchronized or the system is not in redundant mode, the command aborts.

NOTES

When High Availability (HA) synchronization is enabled and the CPs are in sync, the port traffic light does not flash during the failover, even while traffic is continuing to flow.

This command is supported only on dual-CP systems.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To force the failover of the active CP to the standby CP in the switch:

switch:admin> hafailover Local CP (Slot 7, CP1): Active, Warm Recovered Remote CP (Slot 6, CP0): Standby, Healthy HA enabled, Heartbeat Up, HA State synchronized Warning: This command is being run on a redundant control processor(CP) system, and this operation will cause the active CP to reset. Therefore all existing telnet sessions are required to be restarted.

Are you sure you want to fail over to the standby CP [y/n]?

SEE ALSO

haDisable, haEnable, haShow

haShow

Displays control processor (CP) status.

SYNOPSIS

hashow

DESCRIPTION

Use this command to display the control processor status. The display includes the following information:

- Local CP state (slot number and CP ID), warm or cold, recovering or recovered.
- Remote CP state (slot number and CP ID).
- High Availability (enabled or disabled).
- Heartbeat (up or down).
- Health of standby CP
- HA synchronization status

The health of the standby CP is defined as follows:

Healthy

The standby CP is running and the background health diagnostic has not detected any errors.

Failed

The standby CP is running, but the background health diagnostic has discovered a problem with the blade. Check the logs to determine the appropriate action. Failover is disabled until the standby CP is repaired. Information about the failing device in the standby CP is displayed.

Unknown

The standby CP health state is unknown because of one of the following reasons: the standby CP does not exist, Heartbeat is down, or the Health Monitor has detected a configuration file error.

The High Availability synchronization status is defined as follows:

HA State synchronized

The system is currently fully synchronized. If a failover becomes necessary, it is nondisruptive.

HA State not in sync

The system is unable to synchronize the two CPs. This may be caused by one or more of the following conditions:

- The haFailover command was issued. In this case the "HA State not in sync" state is transitory.
- The standby CP is faulty.
- The haSyncStop command was issued.
- A system error occurred.

If a failover becomes necessary while the CPs are not in sync, the standby CP reboots, and the failover is disruptive.

NOTES TH

This command may not be supported on nonbladed systems.

Slot numbers for CP1 and CP0 vary depending on the hardware platform. On the Brocade DCX and DCX 8510-8, CP0 is in slot 6 and CP1 is in slot 7. On the Brocade DCX-4S, and DCX 8510-4, CP0 is in slot 4 and CP1 is in slot 5.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

22 haShow

OPERANDS None

EXAMPLES To display CP status on a Brocade DCX 8510-8 with a healthy standby CP:

switch:admin> hashow

Local CP (Slot 7, CP1) : Active, Warm Recovered Remote CP (Slot 6, CPO) : Standby, Healthy HA Enabled, Heartbeat Up, HA State Synchronized

SEE ALSO haDisable, haEnable, haFailover

haSyncStart

Enables High Availability state synchronization.

SYNOPSIS hasyncstart

DESCRIPTION Use this command to enable the High Availability (HA) state synchronization.

After issuing **haSyncStop**, the switch does not go back to sync start unless you perform one of the following actions: reboot the active CP, reboot the standby CP, insert a new standby CP (blade), or issue the **haSyncStart** command The time it takes for the HA sync to complete depends on the system

configuration. The HA sync timeout is set to 10 minutes.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

EXAMPLES To enable the HA state synchronization:

switch:admin> hasyncstart

SEE ALSO haFailover, haShow, haSyncStop

22

haSyncStop

Disables High Availability state synchronization.

SYNOPSIS hasyncstop

DESCRIPTION Use this command to temporarily disable High Availability (HA) synchronization.

After issuing **haSyncStop**, the switch does not go back to sync start unless you perform one of the following actions: reboot the active CP, reboot the standby CP, insert a new standby CP (blade), or issue the **haSyncStart** command The time it takes for the HA sync to complete depends on the system

configuration. The HA sync timeout is set to 10 minutes.

NOTES Disabling HA synchronization may cause failover to be disruptive.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To disable the HA state synchronizing process:

switch:admin> hasyncstop

SEE ALSO haFailover, haShow, haSyncStart

help

Displays command help information.

SYNOPSIS I

help [command]

help [-p | -page]

help --help

DESCRIPTION

Use this command without operands to display an alphabetical listing of commands for which help is available. When used without an operand, the command listing displays without page break.

Pipe the output through the Unix grep command to filter the output.

Use the **-page** operand to display the commands for which help is available one page at a time. Press **Enter** to go to the next page. When using help with the **-page** option, you can search for specific strings by entering a forward slash, followed by a text string, for example **/zone**.

The help listing includes only commands that are available to the current user; command availability may vary depending on the following conditions:

- Login user role
- License key
- Hardware platform

To access help information for a specific command, enter the command name as an operand.

Commands ending in "Help" display grouped commands for a particular subsystem; for example, the **diagHelp** command displays a list of diagnostic commands.

OPERANDS

This command has the following operands:

command

Specifies the name of the command for which to display help information. This

operand is optional.

p | -page

Displays help output with page breaks.

--help

Displays the command usage.

EXAMPLES

To display a listing of commands for which help is available (with page breaks):

switch:admin> help	-p
aaaconfig	Configure RADIUS for AAA services
ad	Specifies all administration domain
	(AD)-lev1 operations
ag	Configure the Access Gateway feature
agshow	Displays the Access Gateway information
	registered with the fabric
agtcfgdefault	Reset SNMP agent to factory default
aliadd	Add a member to a zone alias
alicreate	Create a zone alias
alidelete	Delete a zone alias
aliremove	Remove a member from a zone alias
alishow	Print zone alias information
aptpolicy	Get and set Advanced Performance

Tuning policy

auditcfg Modifies and displays audit log filter

configuration.

auditdump Display audit log

(output truncated)

To search for the string "zone" while paging is enabled (enter /zone after issuing the command):

switch:admin> help -p

aaaconfig Configure RADIUS for AAA services ad Specifies all administration domain

(AD)-level operations

Configure the Access Gateway feature ag agshow Displays the Access Gateway information

registere with the fabric

agtcfgdefault Reset SNMP agent to factory default

aliadd Add a member to a zone alias

alicreate Create a zone alias alidelete Delete a zone alias

Remove a member from a zone alias aliremove alishow Print zone alias information

Get and set Advanced Performance Tuning aptpolicy

policy

auditcfg Modifies and displays audit log filter

configuration.

auditdump Display audit log

authutil Get and set configuration

backplanetest Backplane connection test for multi-blade

systems.

backport Test for back-end ASIC pair to ASIC pair links.

bannerset Set security banner bannershow Display security banner

Display broadcast routing information bcastshow

Type <CR> or <SPACE BAR> to continue, <q> to stop

/zone

aliadd Add a member to a zone alias

alicreate Create a zone alias alidelete Delete a zone alias

aliremove Remove a member from a zone alias alishow Print zone alias information

aptpolicy Get and set Advanced Performance Tuning policy

auditcfg Modifies and displays audit log filter

configuration.

(output truncated)

To filter the output with the **grep** command:

switch:admin> help | grep errshow errshow Print error log Print port summary porterrshow switch:admin>

SEE ALSO diagHelp, fwHelp, licenseHelp, perfHelp, routeHelp, zoneHelp

historyLastShow

Displays the latest entry in the field replaceable unit (FRU) history log.

SYNOPSIS historylastshow

DESCRIPTION

Use this command to display the latest entry of the history log, which records insertion and removal events for field-replaceable units (FRUs), such as blades, power supplies, fans, and world wide name (WWN) cards. The type of FRU supported depends on the hardware platform.

Each history record contains three lines of information. The first line of each record contains the following fields:

Object type

On standalone platforms: FAN, POWER SUPPLY, WWN (WWN card), or UNKNOWN. On enterprise-class platforms: FAN, POWER SUPPLY, CORE BLADE (core switch blade), AP BLADE (application processor), SW BLADE (port blade), CP BLADE (control processor), WWN (WWN card), or UNKNOWN.

Object number

Slot number for blades. Unit number for all other object types.

Event type

Inserted, Removed, or Invalid.

Time of the event

Format: Day Month dd hh:mm:ss yyyy,

The second and third lines of a record contain the factory part number and factory serial number, if applicable.

Factory Part Number

xx-yyyyyyy-zz or Not available.

Factory Serial Number

xxxxxxxxxxx or Not available.

The size of the history log depends on the hardware platform. The Brocade DCX supports a maximum log size of 50 entries. Because the WWNs are completely separate FRUs in the DCX, they have redundant data in these units. All other platforms that contain FRUs support 28 history log entries.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the late FRU insertion or removal event:

```
switch:admin> historylastshow
```

```
POWER SUPPLY Unit 2 Inserted at Tue Aug 14 15:52:10 2001 Factory Part Number: 60-0001536-02 Factory Serial Number: 1013456800
```

Records: 11

SEE ALSO historyShow

historyMode

Displays the mode of the field replaceable unit (FRU) history log.

SYNOPSIS historymode

DESCRIPTION

Use this command to display the mode of the history buffer, which records the insertion and removal of FRUs on a switch or chassis.

This command supports two modes of handling new log entries once the history buffer has reached its maximum size:

Rotating mode

Any new entry exceeding the maximum buffer size overwrites the oldest entry in

the log. This is the default mode.

First-in mode

Any new entry exceeding the maximum buffer size is discarded. The original

entries in the buffer is preserved.

The history mode is a factory setting that cannot be modified. The size of the history buffer depends on the hardware platform. The Brocade DCX backbone supports a maximum log size of 50 entries. Because the WWNs are completely separate FRUs in the DCX, they have redundant data in these units. All other platforms containing FRUs support 28 history log entries.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the mode of the history log:

switch:admin> historymode

History Mode is: Rotating.

SEE ALSO historyLastShow, historyShow

historyShow

Displays the entire field replaceable unit (FRU) history log.

SYNOPSIS historyshow

DESCRIPTION

Use this command to display the entire history log, which records insertion and removal events for field-replaceable units (FRUs), such as blades, power supplies, fans, and world wide name (WWN) cards. The type of FRU supported depends on the hardware platform.

Each history record contains three lines of information. The first line of each record contains the following:

Object type

On standalone platforms: FAN, POWER SUPPLY, WWN (WWN card), or UNKNOWN.

On enterprise-class platforms: FAN, POWER SUPPLY, CORE BLADE (core switch blade), SW BLADE (port blade), AP BLADE (application processor), CP BLADE (control processor), WWN (WWN card), or UNKNOWN.

Object number

Slot number for blades. Unit number for all other object types.

Event type

Inserted, Removed, or Invalid

Time of the event

Format: Day Month dd hh:mm:ss yyyy

The second and third lines of a record contain the factory part number and factory serial number, if applicable:

Factory Part Number

xx-yyyyyy-zz or Not available

Factory Serial Number

xxxxxxxxxxx or Not available

The size of the history buffer depends on the HW platform. The Brocade DCX supports a maximum log size of 50 entries. Because the WWNs are completely separate FRUs in the DCX, they have redundant data in these units. All other platforms that contain FRUs support 28 history log entries.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the history log of FRUs and removal events on a standalone switch:

switch:admin> historyshow

FAN Unit 3 Removed at Tue Aug 14 10:05:37 1970

Factory Part Number: 20-123456-12 Factory Serial Number: 1013456800

POWER SUPPLY Unit 2 Inserted at Tue Aug 14 15:52:10 2001

Factory Part Number: 60-0001536-02 Factory Serial Number: 1013456800

Records: 11

SEE ALSO historyLastShow

Displays a process summary.

SYNOPSIS i [processID]

DESCRIPTION

Use this command to display information about a specified process or about all processes running on the local switch. One line is displayed per process. Fields displayed with this command include the

F

Process flags:

ALIGNWARN

001 print alignment warning messages

STARTING

002 being created

EXITING

004 getting shut down

PTRACED

010 set if ptrace (0) has been called

TRACESYS

020 tracing system calls

FORKNOEXEC

040 forked but did not exec

SUPERPRIV

100 used super-user privileges

DUMPCORE

200 dumped core

SIGNALED

400 killed by a signal

S

Process state codes:

D

Uninterruptible sleep (usually IO)

R

Runable (on run queue)

S

Sleeping

Т

Traced or stopped

Ζ

A defunct ("zombie") process

UID

The effective user ID number of the process

PID

The process ID of the process

PPID

The process ID of the parent process

С

Processor utilization for scheduling

PRI

Priority number of the process; higher numbers mean lower priority

NI

Nice value used in priority computation

ADDR

Memory address of the process

SZ

The total size of the process in virtual memory, in pages

WCHAN

The address of an event for which a process is sleeping (if blank, process is

running)

TTY

The controlling terminal of the process (? displayed for no controlling terminal)

TIME

The cumulative execution time for the process

CMD

The command name of the process.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

processID

Specifies the process name or process ID for the process to display.

EXAMPLES

To display information about process ID 433:

```
switch:admin> i 433
F S UID PID PPID C PRI NI ADDR SZ WCHAN TTY TIME CMD
000 S 0 433     1 0 69 0 - 1283 5c64 ? 00:00:02 fabricd
```

SEE ALSO diagHelp, routeHelp

iclCfg

Enables or disables Inter-chassis links (ICL).

SYNOPSIS

iclcfg --enable slot/icl_group

iclcfg --disable slot/icl_group

iclcfg --persistentenable slot/icl_group

iclcfq --persistentdisable slot/icl group

iclcfg --help

DESCRIPTION

Use this command to enable or disable an inter-chassis link (ICL) or to enable or disable an ICL persistently. The command enables or disables the ICL by enabling or disabling the ports associated with the link. Persistently disabled ports remain disabled across reboots and power cycles. This command is supported only on the Brocade DCX and the Brocade DCX-S4.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command must be executed on the active CP.

OPERANDS

This command has the following operands:

slot

Specifies the slot number of the ICL group to be enabled or disabled, followed by a slash (/). The slot on the DCX can be either 5 or 8. On the DCX-4S, valid slots are 3 and 6.

icl_group

Specifies the ICL port group to be disabled or enabled. An ICL group represents a range of ports. Specify 0 to enable or disable ports 0 to 15. Specify 1 to enable or disable ports 16 to 31.

--enable

Enables the ICL for the specified port group.

--disable

Disables the ICL for the specified port group.

--persistentenable

Persistently enables the ICL for the specified port group.

--persistentdisable

Persistently disables the ICL for the specified port group.

--help

Displays the command usage.

EXAMPLES

To disable the ICL for ports 16-31:

switch:user> iclcfg --disable 8/1

To enable the ICL for ports 16-31:

switch:user> iclcfg --enable 8/1

22 iclCfg

To disable the ICL for ports 16-31 persistently: switch:user> iclcfg --persistentdisable 8/1

To enable the ICL for ports 16-31 persistently:

switch:user> iclcfg --persistentdnable 8/1

SEE ALSO None

ifModeSet

Sets the link operating mode for a network interface.

SYNOPSIS ifmodeset ["interface"]

DESCRIPTION

Use this command to set the link operating mode for a network interface.

An operating mode is confirmed with a **y** or **yes** at the prompt. If the operating mode selected differs from the current mode, the change is saved and the command exits.

Changing the link mode is not supported for all network interfaces or for all Ethernet network interfaces. On the CP of a Brocade DCX or DCX-S4, this command supports **eth0** and **eth3** as interface parameters. On all other platforms, only **eth0** is supported.

When selecting autonegotiation, you can choose the specific link operating modes that are advertised to the link partner. At least one common link operating mode must be advertised by both sides of the link.

When forcing the link operating mode, both sides of the link must be forced to the same mode. The link does not work reliably if one side is set to autonegotiate and the other side is set to forced mode.

Exercise care when using this command. Forcing the link to an operating mode not supported by the network equipment to which it is attached might result in an inability to communicate with the system through its Ethernet interface. It is recommended that this command be used only from the serial console port. When used through an interface other than the serial console port, the command displays a warning message and prompts for verification before continuing. This warning is not displayed and you are not prompted when the command is used through the serial console port.

For dual-CP systems, the **ifModeSet** command affects only the CP you are currently logged in to. To set the link operating mode on the active CP, you must issue this command on the active CP; to set the link operating mode on the standby CP, you must issue this command on the standby CP. During failover, the link operating mode is retained separately for each CP, because the physical links might be set to operate in different modes.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

"interface"

Specify the name of the interface, optionally enclosed in double quotation marks. When issued on a Brocade DCX or a DCX-S4 CP, valid interfaces are eth0 and eth3. On all other platforms, only eth0 is supported.

EXAMPLES

To advertise all modes of operation, when not entering this command through the serial console port, follow this scenario for the **ifModeSet** command:

```
switch:admin> ifmodeset eth0

Exercise care when using this command. Forcing the link to an operating mode not supported by the network equipment to which it is attached may result in an inability to communicate with the system through its ethernet interface.

It is recommended that you only use this command from the serial console port.

Are you sure you really want to do this? (yes, y, no, n): [no] y Proceed with caution.

Auto-negotiate (yes, y, no, n): [no] y
```

```
Advertise 100 Mbps / Full Duplex (yes, y, no, n): [yes] y
Advertise 100 Mbps / Half Duplex (yes, y, no, n): [yes] y
Advertise 10 Mbps / Full Duplex (yes, y, no, n): [yes] y
Advertise 10 Mbps / Half Duplex (yes, y, no, n): [yes] y
Committing configuration...done.
```

To force the link for the eth0 interface from autonegotiation to 10 Mbps half-duplex operation, when entering this command through the serial console port:

```
switch:admin> ifmodeset eth0
Auto-negotiate (yes, y, no, n): [yes] n
Force 100 Mbps / Full Duplex (yes, y, no, n): [no] n
Force 100 Mbps / Half Duplex (yes, y, no, n): [no] n
Force 10 Mbps / Full Duplex (yes, y, no, n): [no] n
Force 10 Mbps / Half Duplex (yes, y, no, n): [no] y
Committing configuration...done.
```

SEE ALSO ifModeShow

ifModeShow

Displays the link operating mode and MAC address for a network interface.

SYNOPSIS

ifmodeshow interface

DESCRIPTION

Use this command to display the link operating mode and MAC address for a network interface.

On the CP of a Brocade DCX or DCX-S4, this command supports eth0 and eth3 as interface parameters. On all other platforms, only eth0 is supported.

The CP on a Brocade DCX or DCX-S4 has two external physical Ethernet management ports, eth1 and eth3. Both interfaces are bonded together to form a single logical interface, bond0.

The management port IP addresses are assigned to the logical interface, **bond0**. Link layer Ethernet operations are applied to the physical interfaces, eth0 and eth3.

Ethernet bonding provides link layer redundancy using the active-standby failover model. The two Ethernet ports must be part of the same subnet. By default, all traffic is transmitted over the active Ethernet port, eth0. The second Ethernet port, eth3, acts as a standby interface and no traffic is transmitted over it. When the active Ethernet port is disconnected, the alternate Ethernet port becomes active. When the system reboots, the Ethernet port eth0 is always made active if it is connected.

When executed with the **bond0** operand, **ifModeShow** displays the active Ethernet port

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

interface

Specifies the name of the interface, optionally enclosed in double quotation marks. Valid interfaces include the following:

eth0 | eth3

Displays the link operating mode of the specified interface. The value eth3 is valid

only on the CP of a Brocade DCX or DCX-4S.

bond0

Displays the active Ethernet port. This operand is valid only on the CP of a DCX or a DCX-S4.

EXAMPLES

To display the link operating mode for the **eth0** Ethernet interface:

```
switch:admin> ifmodeshow eth0
Link mode: negotiated 100baseTx-HD, link ok
MAC Address: 00:60:69:D0:24:40
```

To display the link operating mode for the eth3 Ethernet interface (in the example, the management port is disconnected):

```
switch:admin> ifmodeshow eth3
Link mode: no link
MAC Address: 00:05:1E:40:62:30
```

22 ifModeShow

To display the active interface:

ras010:root> ifmodeshow bond0 Currently Active Slave: eth0

SEE ALSO ifModeSet

interfaceShow

Displays FSPF interface information.

SYNOPSIS interfaceshow [slot/][port]

DESCRIPTION

Use this command to display the two data structures associated with FSPF interfaces (E_Ports) on the switch:

- The permanently allocated interface descriptor block (IDB).
- The neighbor data structure. This data structure is allocated when a switch port becomes an E_Port.
 The neighbor data structure contains all the information relating to the switch that is connected to an adjacent switch.

This command displays the content of both data structures, if they have been allocated.

The following fields are displayed:

idbP

Pointer to IDB.

nghbP

Pointer to neighbor data structure.

ifNo

Interface number.

masterPort

Port number of the trunk master port, if present, of the trunk group of which this

port is a part.

defaultCost

Default cost of sending a frame over the interswitch link (ISL) connection to this

interface.

cost

Cost of sending a frame over the ISL connected to this interface. A value of 1000 indicates a 1-Gbps link. A value of 500 indicates a 2-Gbps link. For links with a bandwidth greater than 2 Gbps, the cost is 500. For links with less than 1 Gbps,

the cost is 2000. Refer to linkCost for more information.

delay

Conventional delay incurred by a frame transmitted on this ISL. A fixed value

required by the FSPF protocol.

lastScn

Type of the last State Change Notification received on this interface.

lastScnTime

Time the last State Change Notification was received on this interface.

upCount

Number of times this interface came up, with respect to FSPF.

lastUpTime

Last time this interface came up.

downCount

Number of times this interface went down.

lastDownTime

Last time this interface went down.

downReason

Type of last State Change Notification that caused this interface to go down.

iState

Current state of this interface. The state can be UP or DOWN. An interface in DOWN state does not have an allocated neighbor data structure and cannot be

used to route traffic to other switches.

state

Current state of this interface. This E_Port is used to route traffic to other switches

only if the state is NB_ST_FULL.

lastTransition

Time the last state changed on this interface.

nghbCap

Neighbor capabilities. Should be 0.

nghbld

Domain ID of the neighbor (adjacent) switch.

idbNo

IDB number. Should be equal to port.

remPort

Port number on the remote switch connected to this port.

nflags

Internal FSPF flags.

initCount

Number of times this neighbor was initialized without the interface going down.

lastInit

Time of the last initializing state, NB_ST_INIT, on this interface.

firstHlo

Time of the first hello sent on this interface.

nbstFull

Time of the last finishing state, NB_ST_FULL, on this interface.

&dbRetransList

Pointer to the database retransmission list.

&IsrRetransList

Pointer to the link state records (LSR) retransmission list.

&lsrAckList

Pointer to the link state acknowledgements (LSA) retransmission list.

inactTID

Inactivity timer ID.

helloTID

Hello timer ID.

dbRtxTID

Database retransmission timer ID.

IsrRtxTID

LSR retransmission timer ID.

inactTo

Inactivity timeout value, in milliseconds. When this timeout expires, the adjacency with the neighbor switch is broken and new paths are computed to all possible

destination switches in the fabric.

helloTo

Hello timeout value, in milliseconds. When this timeout expires, a Hello frame is

sent to the neighbor switch through this port.

rXmitTo

Retransmission timeout value, in milliseconds. It is used to transmit topology

information to the neighbor switch. If no acknowledgement is received within this

value, the frame is retransmitted.

nCmdAcc

Total number of commands accepted from the neighbor switch. Number includes

Hellos, Link State Updates (LSUs), and LSAs.

nInvCmd

Number of invalid commands received from the neighbor switch. Usually

commands with an FSPF version number higher than the one running on the local

switch.

nHloIn

Number of Hello frames received from the neighbor switch.

nInvHlo

Number of invalid Hello frames (Hello frames with invalid parameters) received

from the neighbor switch.

nLsuln

Number of LSUs received from the neighbor switch.

nLsaln

Number of LSAs received from the neighbor switch.

attHloOut

Number of attempted transmissions of Hello frames to the neighbor switch.

nHloOut

Number of Hello frames transmitted to the neighbor switch.

attLsuOut

Number of attempted transmissions of LSUs to the neighbor switch.

nLsuOut

Number of LSUs transmitted to the neighbor switch.

attLsaOut

Number of attempted transmissions of LSAs to the neighbor switch.

nLsaOut

Number of LSAs transmitted to the neighbor switch.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to be displayed,

followed by a slash (/).

port

Specify the number of the port to be displayed, relative to its slot for bladed systems. Use **switchShow** for a list of valid ports. This operand is optional; if

omitted, the interface information for all ports is displayed.

When invoked without operands, this command displays the interface information for all ports on the switch (including non-E_Ports).

EXAMPLES

To display FSPF interface information:

idbP

switch:user> interfaceshow 1/4

= 0x1008b3d0

```

SEE ALSO nbrStateShow, portShow, switchShow

iodReset

Disables in-order delivery (IOD) on a switch.

SYNOPSIS iodreset

DESCRIPTION Use this command to disable in-order delivery enforcement on the local switch. IOD is disabled by

default, and can only be disabled after it has been enabled with the iodSet command. This command

disables the legacy IOD enforcement only.

Disabling IOD allows faster rerouting after a fabric topology change, but it may cause out-of-order

delivery of frames during fabric topology changes.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To disable IOD enforcement:

switch:admin> iodreset

IOD is not set

SEE ALSO iodSet, iodShow

iodSet

Enables in-order delivery (IOD).

SYNOPSIS iodset

iodset --help

DESCRIPTION

Use this command to enforce in-order delivery of frames during a fabric topology change.

In a stable fabric, frames are always delivered in order, even when the traffic between switches is shared among multiple paths. However, when topology changes occur in the fabric (for instance, a link goes down), traffic is rerouted around the failure and some frames might be delivered out of order. This command ensures that frames are not delivered out-of-order, even during fabric topology changes. It enforces a sufficient delay between the event that causes an existing path to be removed and the establishment of a new path, so that frames are delivered in order. However, this also means that frames are dropped during the delay, causing I/O failures.

When used without operands, **iodSet** enables in-order-delivery of frames on a switch (legacy IOD behavior). Frame loss is unavoidable when a port goes down.

IOD is disabled by default. Use **iodShow** to display current settings. Use **iodReSet** to restore the default setting.

NOTES

You can no longer use this command to manage Lossless DLS. Use **dlsSet** instead. The following command options are deprecated in Fabric OS v6.4.0 and later:

- iodset --enable -lossLessDls
- iodset --disable -lossLessDls
- iodset --show

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--help

Displays the command usage.

EXAMPLES

To display the default legacy IOD setting:

```
switch:admin> iodshow
IOD is not set
```

To enable IOD:

```
switch:admin> iodset
```

IOD is set

SEE ALSO

 $iod Show, \, iod Reset \,$

22 iodShow

iodShow

Displays the in-order delivery (IOD) setting.

SYNOPSIS iodshow

DESCRIPTION Use this command to display the IOD setting on the switch. By default, IOD is disabled.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the current setting of the IOD setting:

ipAddrSet

Sets the Ethernet and FC IP addresses.

```
ipaddrset [-ipv6 ] [--add x:x:x:x:x:x:x/n | --delete]

ipaddrset [-cp cp_number | -chassis]
        [-ipv6 ] [--add x:x:x:x:x:x/n | --delete]

ipaddrset [-slot slot] [-eth0 | -eth1] [--add x.x.x.x/n | --delete]

ipaddrset [-slot slot] -gate [--add x.x.x.x | --delete]

ipaddrset -ls FID --add IPv4_address/prefix

ipaddrset -ls FID --delete

ipaddrset -ipv6 [-auto | -noauto]
```

ipaddrset [-cp cp_number | -chassis]

DESCRIPTION

Use this command to configure the IP addresses on a switch, a control processor (CP), a blade processor (BP), or a standalone application processor (AP). On platforms that support Logical Fabrics, this command configures the IPv4 Fibre Channel addresses for the logical fabric IPFC network interface. The IPFC (IP over Fibre Channel) protocol allows switches to send IP traffic over Fibre Channel rather than through Ethernet connections.

This command supports an interactive legacy mode and a command line interface. Use the command line interface to configure IPv6 addresses, to enable or disable stateless IPv6 autoconfiguration, to assign a Fibre Channel IPv4 address and prefix to a logical switch IPFC network interface, and to configure a service port on the CP blade of a Brocade DCX. When run interactively in legacy mode, this command sets the Ethernet IPv4 address, subnet mask, and Gateway on a switch or a chassis.

Command usage depends on the type of IP address and on the platform on which the command is run. Some of the platform- and IP address-specific features of the command are outlined below. For complete details, refer to the *Fabric OS Administrator's Guide*.

Configuring IP Addresses using the command line interface

- The command accepts the -ipv6 command line syntax with the --add or --delete option on all platforms that support IPv6 addresses. The --add option configures a single static IPv6 address and prefix for the specified managed entity (chassis, CP, or AP). The --delete option deletes a static IPv6 address and prefix for the specified managed entity. On modular platforms, the command can be executed only on the active CP.
 - When using the command line syntax to add or delete IPv6 addresses, the managed entity is
 identified only on modular platforms. To set the CP IPv6 address, use the -cpoption; to set the
 IP address for the entire chassis, use the -chassis option.
 - When using the command line syntax to add or delete IPv6 addresses on standalone platforms, the implied entity is the single managed entity supported by the platform and must be left unspecified.
 - Additionally, the -eth0, -eth1, and -gate command line options are available with the --add or --delete option on platforms with blade processors to set the BP Ethernet or Gateway addresses. On a chassis with a blade processor the values for the blade in can be set from the command line using the -slot option. The -slot option is not accepted in standalone application processors with a hidden blade, such as the AP7600.

- Use the **-auto** and **-noauto** options to enable or disable stateless IPv6 autoconfiguration.
- Use the **-Is** option with appropriate arguments to set or delete the IPv4 Fibre Channel address and prefix for the IPFC interface of a logical switch. In a Virtual Fabric environment, each logical fabric is represented by a separate IPFC network interface. Each of these network interfaces can be assigned a unique IPv4 FC address and prefix. The logical switches that make up a logical fabric are identified by the fabric ID (FID) that is assigned to each of the logical switch instances.

When setting the IPFC interface of a switch that is not in Virtual Fabric mode, use the -Is option with FID 128. FID 128 identifies the switch when Virtual Fabrics are disabled.

Setting IP addresses interactively (IPv4 Ethernet address only):

- To set the CP Ethernet IPv4 address, use the -cp option; to set the Ethernet IP address for the entire chassis, use the **-chassis** option. When setting the chassis IP address, the command prompts for the Ethernet IP address and Ethernet subnet mask. When setting the CP Ethernet IP address, the command prompts for the host name, Ethernet IP address, Ethernet subnet mask, and Gateway IP address. Valid switch and CP numbers depend on the platform on which the command is run. The command must be executed on the active CP.
- On most standalone platforms (with the exception of the AP7600), ipAddrSet runs interactively if invoked without operands. The command prompts for the Ethernet IP address, Ethernet subnet mask, and Gateway IP address. In addition, the command prompts for a specification of whether the Dynamic Host Control Protocol (DHCP) should be used to acquire the Ethernet IP address, Ethernet subnet mask and Gateway IP address. Valid entries are "On" to enable DHCP and "Off" to disable it. When DHCP is enabled, any user-configured Ethernet IP address, Ethernet subnet mask or Gateway IP address is ignored.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

When used in command line mode, the following operands are supported:

-lpv6

Specifies IP address type as static IPv6 including prefix as needed.

--add x:x:x:x:x:x/n

Sets the specified IPv6 address.

--delete [x:x:x:x:x:x/n]

Deletes the specified IPv6 address. If no address is specified, any existing IPv6 addresses and prefixes are deleted from the specified or implied entity.

-cp cp_number

Specifies the CP on a chassis. Valid values are 0 or 1.

-chassis

Specifies the IPv6 address and prefix of a chassis.

On platforms with blade processors, the following additional command line options are supported with the --add or --delete options:

-eth0 | -eth1

Specifies the local IPv4 address of the blade processor. A prefix is required.

-gate

Specifies the IPv4 address of the blade processor (BP) Gateway (no prefix).

-slot number

On a chassis with a blade processor (BP), specifies the slot number. On standalone platforms with a hidden BP, such as the AP76500, this parameter is not accepted.

-ipv6 [-auto | -noauto]

Enables or disables stateless IPv6 autoconfiguration on a switch or chassis. When autoconfiguration is enabled, the host automatically performs configuration of IPv6 addresses and periodic nondisruptive reconfiguration. By default, autoconfiguration is disabled.

-Is FID

Specifies the logical fabric ID for which to configure an IPFC network interface. The FID is a decimal number. A switch that is not in Virtual Fabric mode uses the -ls parameter with *FID* 128 (the effective, single Logical Fabric number on such switches) to set the IPv4 FC address. Note that setting the IP address for the logical switch is only for the IPFC interface, not for the Ethernet interface.

--add

Assigns a specified IPv4 FC address and prefix to the logical switch instance represented by the specified FID. This command replaces any existing FC IPv4 address.

IPv4_address/prefix

Specifies the IPv4 address and prefix for the IPFC network interface. The IP Address is represented by a dotted decimal number, followed by a slash and a prefix. This operand is required with the **--add** option.

--delete

Deletes the IPv4 FC address and prefix from a logical switch.

-ls IFID

Specifies the fabric ID that identifies the logical switch for which to delete the FC IPv4 address and prefix. This operand is required when deleting an FC IPv4 address from a logical switch. On a switch that is not in Virtual Fabric mode, use the **-Is** parameter with *FID* 128 (the effective, single Logical Fabric number on such switches) to delete the IPv4 FC address.

When used interactively to configure IPv4 addresses on a modular platform, ipAddrSet prompts for the following parameters:

-cp cp_number

Specifies the managed entity as a CP. Valid values include the following:

0

Sets the Ethernet IP address, Ethernet subnet mask, gateway IP address and host name of CP0.

1

Sets the Ethernet IP address, Ethernet subnet mask, gateway IP address and host name of CP1.

-chassis

Specifies the managed entity as the chassis.

EXAMPLES

To configure an IPv6 address and prefix on a standalone platform:

```
switch:admin> ipaddrset -ipv6 --add \
fec0:60:69bc:60:260:69ff:fed0:107/64
```

To configure an IPv6 address and prefix on a single CP of a chassis:

```
switch:admin> ipaddrset -cp 0 -ipv6 --add \
     1080::8:800:200C:417A/64
```

To delete any existing IPv6 address and prefix on CP0 on an enterprise-class platform:

```
switch:admin> ipaddrset cp 0 -ipv6 --delete
```

To configure an IPv4 FC address for the IPFC interface associated with a logical switch with fabric ID

```
switch:admin> ipaddrset -ls 123 --add 11.1.2.4/24
IP address is being changed...Done.
```

To verify the IPv4 FC address for the logical switch:

```
switch:admin> ipaddrshow
Ethernet IP Address: 10.32.220.10
Ethernet Subnetmask: 255.255.240.0
Ethernet IP Address: 10.32.220.11
Ethernet Subnetmask: 255.255.240.0
Host Name: cp0
Gateway IP Address: 10.32.208.1
Ethernet IP Address: 10.32.220.12
Ethernet Subnetmask: 255.255.240.0
Host Name: cpl
Gateway IP Address: 10.32.208.1
IPFC address for logical fabric ID 128: 1.2.3.4/24
Backplane IP address of CPO : 10.0.0.5
Backplane IP address of CP1 : 10.0.0.6
```

To delete the IPv4 address for the IPFC interface associated with a logical switch with Virtual Fabric ID

```
switch:admin> ipaddrset -ls 67 --delete
IP address is being changed...Done.
```

To configure an IPv4 FC address for the IPFC interface associated with a switch that is not in Virtual Fabric mode:

```
switch:admin> ipaddrset -ls 128 --add 10.32.72.70/24
IP address is being changed...Done.
```

To verify the changes:

```
switch:admin> ipaddrshow
SWITCH
Ethernet IP Address: 10.32.72.9
Ethernet Subnetmask: 255.255.240.0
Gateway IP Address: 10.32.64.1
DHCP: Off
IPFC address for virtual fabric ID 128: 10.32.72.70/24
```

To set the IPv4 address details for a switch chassis in interactive mode:

```
switch:admin> ipaddrset -chassis
Ethernet IP Address [192.168.166.148]:
Ethernet Subnetmask [255.255.255.0]:
Committing configuration...Done.
```

To enable DHCP on a standalone, non-AP platform:

switch:admin> ipaddrset
Ethernet IP Address [192.168.74.102]:
Ethernet Subnetmask [255.255.255.0]:
Gateway IP Address [192.168.74.1]:
DHCP [Off]: on

SEE ALSO ipAddrShow

ipAddrShow

Displays IP address information for a switch or control processor (CP).

SYNOPSIS ipaddrshow

ipaddrshow [-cp cp_number] | -chassis

ipaddrshow -slot slot [-eth0 | -eth1 | -gate

DESCRIPTION

Use this command to display the IP addresses configured in the system.

The -cp option displays the IP address for a specified CP on modular platforms, or use the command without arguments to display the IP address on a standalone switch, or the IP addresses for both CPs on a chassis.

On a standalone switch, the command displays the following information:

- Ethernet IP Address
- Ethernet Subnet mask
- The Gateway IP Address
- Dynamic Host Control Protocol (DHCP): on or Off
- Pv6 Autoconfiguration Enabled: Yes or No
- Local IPv6 Addresses

On modular platforms, the command displays the following information:

For the chassis:

- Ethernet IP Address
- Ethernet Subnet mask

For each CP:

- Ethernet IP Address
- Ethernet Subnet mask
- Host Name
- Gateway IP Address

If the IPFC network interface is configured for logical switches:

IPFC address for Virtual Fabric ID

For each CP:

- Backplane IP address
- IPv6 Autoconfiguration Enabled: Yes or No. If enabled, the command displays:
 - All local IPv6 Addresses
 - □ Gateway IP addresses for both CPs

Local IPv6 addresses display the following identifiers:

- IP Address type:
 - static A statically configured IPv6 address.
 - **stateless** Acquired through stateless autoconfiguration.
- IP Address state:
 - tentative
 - preferred
 - deprecated

Refer to the RFC 2462 specification for more information.

On modular platforms with intelligent blades, the addresses configured for each slot can be shown with the **-slot** option. On standalone platforms, all command options are ignored.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-cp cp_number

On dual-CP systems, specifies the CP card number to be displayed (0 or 1).

-chassis

On dual-CP systems, displays the IP addresses for the chassis.

-slot slot

Specifies the slot for a blade.

-eth0 | -eth1 | -gate

For a specified slot, shows only the selected Ethernet interface or the gateway . This operand is optional with the **-slot** option.

EXAMPLES

To display the IP addresses on a standalone switch:

```
switch:admin> ipaddrshow
SWITCH
```

Ethernet IP Address: 192.168.163.238
Ethernet Subnetmask: 255.255.255.0

Gateway IP Address: 192.168.163.1

DHCP: Off
IPv6 Autoconfiguration Enabled: No
Local IPv6 Addresses:
static 1080::8:800:200c:417a/64

To display all IP addresses on a Brocade DCX backbone:

switch:admin> ipaddrshow

```
Chassis
Ethernet IP Address: 10.33.60.85
Ethernet Subnetmask: 255.255.240.0
CP0
Ethernet IP Address: 10.33.60.86
Ethernet Subnetmask: 255.255.240.0
Host Name: cp0
Gateway IP Address: 10.33.48.1
CP1
Ethernet IP Address: 10.33.60.87
Ethernet Subnetmask: 255.255.240.0
Host Name: cp1
Gateway IP Address: 10.33.48.1
Backplane IP address of CPO : 10.0.0.5
Backplane IP address of CP1 : 10.0.0.6
IPv6 Autoconfiguration Enabled: Yes
Local IPv6 Addresses:
```

```
chassis 0 stateless fd00:60:69bc:63:205:1eff:fe39:e45a/64 preferred
chassis 0 stateless fec0:60:69bc:63:205:1eff:fe39:e45a/64 preferred
cp 0 stateless fd00:60:69bc:63:205:1eff:fe40:6230/64 preferred
cp 0 stateless fec0:60:69bc:63:205:1eff:fe40:6230/64 preferred
cp 1 stateless fd00:60:69bc:63:205:1eff:fe39:ff2a/64 preferred
cp 1 stateless fec0:60:69bc:63:205:1eff:fe39:ff2a/64 preferred
IPv6 Gateways:
cp 0 fe80:60:69bc:63::3
cp 0 fe80:60:69bc:63::1
cp 0 fe80:60:69bc:63::2
cp 1 fe80:60:69bc:63::1
cp 1 fe80:60:69bc:63::2
cp 1 fe80:60:69bc:63::3
```

To display the IP addresses for a chassis:

```
switch:admin> ipaddrshow -chassis
CHASSIS
Ethernet IP Address: 10.32.220.10
Ethernet Subnetmask: 255.255.240.0
IPv6 Autoconfiguration Enabled: Yes
Local IPv6 Addresses:
chassis 0 stateless fd00:60:69bc:63:205:1eff:fe39:e45a/64 preferred
chassis 0 stateless fec0:60:69bc:63:205:1eff:fe39:e45a/64 preferred
IPv6 Gateways:
```

To display only the IP addresses for CP 1:

```
switch:admin> ipaddrshow
Ethernet IP Address: 10.33.60.87
Ethernet Subnetmask: 255.255.240.0
Host Name: cp1
Gateway IP Address: 10.33.48.1
```

ipFilter

Manages the IP filter policies.

SYNOPSIS

ipfilter --create policyname -type ipv4 | ipv6

ipfilter --clone policyname -from src_policyname

ipfilter --show [-a] [policyname]

ipfilter --save [policyname]

ipfilter --activate policyname

ipfilter --delete policyname

ipfilter --addrule policyname -rule rule_number[-sip source_IP]
 -dp destination_port -proto protocol -act permit | deny
 [-type INPUT | FWD] [-dip destination_IP]

ipfilter --delrule policyname -rule rule number

ipfilter --transabort

ipfilter --clrcounters

ipfilter -- showcounters

DESCRIPTION

Use this command to manage IP filter policies. The **ipFilter** command and command options are noninteractive, except when prompting for a confirmation.

The IP filter policy sets up a packet filtering firewall to provide access control on the management IP interface. The IPv4 and IPv6 policies are either in the defined configuration or in the active configuration.

Excluding the default policies, there can be a maximum of six policies in the defined configuration and one policy per IPv4 and IPv6 type in the active configuration.

The active policy must be the default policy or one of the policies in the defined configuration. Only the active policies are enforced. All of the **ipFilter** options except **--show** and **--transabort**, create a transaction owned by the management session initiating the commands.

An open transaction prevents other transactions from being created on different management sessions. The **--create**, **--clone**, **--delete**, **--addrule**, and **--delrule** operands modify policies in memory buffer, while operands, **--save** and **--activate** commit policies to the persistent configuration. The operands, **--save** and **--activate**, implicitly end the transaction if all policy changes are committed. The operand **--transabort** explicitly ends an open transaction and aborts policy changes in memory buffer. Closing the management session that owns the transaction also aborts policy changes and closes the transaction.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

In a Virtual Fabric environment, IP Filter policies are treated as chassis-wide configurations and apply to all logical switches in the chassis. Chassis permissions are required to manage IP Filter policies.

OPERANDS

This command has the following operands:

policyname

Specifies an IP filter policy name. The policy name is a unique string composed of a maximum of 20 alphanumeric or underscore characters. The default_ipv4 and default_ipv6 names are reserved for default IP filter policies. The policy name is case-insensitive and is always stored as lower case. The policy type identifies the policy as an IPv4 or IPv6 filter. You can create a maximum of eight IP filter policies.

--create policyname -type ipv4 | ipv6

Creates an IP filter policy with the specified name and type. The policy created is stored in a temporary buffer and is lost if the policy is not saved to the persistent configuration.

--clone policyname -from src_policyname

Creates a replica of an existing IP filter policy. The cloned policy is stored in a temporary buffer and has the same rules as the original policy.

--show [-a] [policyname]

Displays the IP filter policy content for the specified policy name or all IP filter policies if policyname is not specified. For each IP filter policy, the policy name, type, persistent state, and policy rules are displayed. The policy rules are listed by the rule number in ascending order. The -a option displays the traffic type and the configured destination IP.

Command output displays without pagination. Use command | more to display the output with page breaks. If a temporary buffer exists for an IP filter policy, the --show operand displays the content in the temporary buffer, with the persistent state set to modified defined or modified active.

--save [policyname]

Saves one or all IP filter policies persistently as the defined configuration. This operand is optional. If a policy name is specified, only the specified IP filter policy in the temporary buffer is saved; otherwise, all IP filter policies in the temporary buffer is saved. Only the CLI session that owns the updated temporary buffer can run this command. Modification to an active policy cannot be saved without being applied. Therefore, the --save option is blocked for the active policies; instead use the --activate option.

--activate policyname

Activates the specified IP filter policy. IP filter policies are not enforced until they are activated. Only one IP filter policy per IPv4 and IPv6 type can be active. If there is a temporary buffer for the policy, the policy is saved to the defined configuration and activated at the same time. If there is no temporary buffer for the policy, the policy existing in the defined configuration becomes active. The policy to be activated replaces the existing active policy of the same type. Activating the default IP filter policies returns the IP management interface to its default state. An IP filter policy without any rule cannot be activated. This operand prompts for confirmation before proceeding.

--delete policyname

Deletes the specified IP filter policy. Deleting an IP filter policy removes it from the temporary buffer. To permanently delete the policy from the persistent database, issue the ipfilter --save command. An active IP filter policy cannot be deleted.

--addrule policyname

Adds a new rule to the specified IP filter policy. The change made to the specified IP filter policy is not saved to the persistent configuration until saved or activated.

The following arguments are supported with the **--addrule** option:

-sip source_IP

Specifies the source IP address. For filters of type IPv4, the address must be a 32-bit address in dot notation, or a CIDR-style IPv4 prefix. For filters of type IPv6, the address must be a 12- bit IPv6 address in any format specified by RFC3513, or a CIDR-style IPv6 prefix. The source IP option is not supported for FORWARD traffic

-dp destination_port

Specifies the destination port number, a range of port numbers, or a service name. Note that blocking or permitting of ports 1024 and above is not allowed. These ports are used by various applications and services on the switch.

-proto protocol

Specifies the protocol type, for example, *tcp* or *udp*.

-act permit | deny

Specifies the permit or deny action associated with this rule. Blocking or permitting port 1024 and above is not allowed. Ports numbered 1024 and higher are used by applications for services such as FTP and blocking these ports may cause these applications to behave in unexpected ways.

rule_number

Adds a new rule at the specified rule index number. The rule number must be between 1 and the current maximum rule number plus one.

-type INPUT | FWD

Specifies the type of traffic that is allowed for the specified IP address. Forwarding rules manage the bidirectional traffic between the external Ethernet interface (eth0/bond0) and the inband management interface (inbd+). INPUT traffic is the default type of traffic for IP filter rules.

-dip destination_IP

Specifies the destination IP address. For filters of type IPV4, the address must be a 32-bit address in dot notation, or a CIDR-style IPv4 prefix. For filters of type IPv6, the address must be in a 128-bit IPv6 address in any format specified by RFC3513, or a CIDR-style IPv6 prefix. The destination IP option is not be supported for INPUT traffic type.

--delrule policyname -rule rule_number

Deletes a rule from the specified IP filter policy. Deleting a rule in the specified IP filter policy causes the rules following the deleted rule to shift up in rule order. The change to the specified IP filter policy is not saved to the persistent configuration until it is saved or activated.

--transabort

A transaction is associated with a CLI or manageability session, which is opened implicitly when you execute the **--create**, **--addrule** and **--delrule** subcommands. The **--transabort** command explicitly ends the transaction owned by the current CLI or manageability session. If a transaction is not ended, other CLI or manageability sessions are blocked on the subcommands that would open a new transaction.

--circounters

Clears the IP filter counters.

--showcounters

Displays the IP filter counters.

EXAMPLES

To create an IP filter for a policy with an IPv6 address:

switch:admin> ipfilter --create ex1 -type ipv6

To add a new rule to the policy and specify the source IP address, destination port, and protocol, and to permit the rule:

```
switch:admin> ipfilter --addrule ex1 \
    -sip fec0:60:69bc:60:260:69ff:fe80:d4a -dp 23 \
    -proto tcp -act permit
```

To display all existing IP filter policies:

switch:admin> ipfilter --show

Name:	default_ipv4,	Type: ipv4,	State: acti	ve
Rule	Source IP	Protocol	Dest Port	Action

To activate the IP Filter policy "ex1":

```
switch:admin> ipfilter --activate ex1
```

To display al I IP Filter policies, including the activated policy:

```
switch:admin> ipfilter --show
```

                                                   permit
```

To create an IPv4-type IP filter policy:

```
switch:admin> ipfilter --create ex2 -type ipv4
```

To add a rule to the created policy "ex2":

```
switch:admin> ipfilter --addrule ex2 -sip 10.32.69.99 \
    -dp 23 -proto tcp -act permit
```

To display the IP filter policies, including the new policy:

```
switch:admin> ipfilter --show
```

```

ipSecConfig

Configures Internet Protocol security (IPSec) policies for Ethernet management interfaces.

SYNOPSIS

ipsecconfig --enable [default] --disable

ipsecconfig --add | --modify type [subtype] [arguments]

ipsecconfig --delete [type] arguments

ipsecconfig --flush manual-sa

ipsecconfig --show type [subtype] arguments

ipsecconfig --help [command_type subtype]

DESCRIPTION

Use this command to configure the Internet Protocol Security (IPSec) feature for traffic flows on switch Ethernet management interfaces, or to display the current configuration.

Internet Protocol security (IPSec) is a framework of open standards that provides private, secure communication over Internet Protocol (IP) networks through the use of cryptographic security services.

IPSec uses different protocols to ensure the authentication, integrity, and confidentiality of the communication.

- Encapsulating Security Payload (ESP) provides confidentiality, data integrity and data source authentication of IP packets, and protection against replay attacks.
- Authentication Header (AH) provides data integrity, data source authentication, and protection against replay attacks, but unlike ESP, AH does not provide confidentiality.

IPSec can protect either the entire IP datagram or only the upper-layer protocols. The appropriate modes are called tunnel mode and transport mode.

- In tunnel mode the IP datagram is fully encapsulated by a new IP datagram using the IPSec protocol.
- In transport mode only the payload of the IP datagram is handled by the IPSec protocol; it inserts the IPSec header between the IP header and the upper-layer protocol header.

The IPSec key management supports Internet Key Exchange (IKE) or Manual key/SA entry.

- In IKE the IPSec protocol negotiates shared security parameters and keys. Security Associations (SAs) used in IKE use automatically generated keys for authentication negotiation between peers.
- Manual key/SA entry requires the keys to be generated and managed manually, and it is therefore suited for small static environments. For the selected authentication or encryption algorithms, the correct keys must be generated. The key length is determined by the algorithm selected. Refer to the Fabric OS Administrator's Guide for more information.

The following IPSec configuration tasks can be performed with this command:

- Enable or disable the IPSec policies.
- Configure IP address for both IPv4 and IPv6 format.
- Configure three types of policies and their respective components:
 - IPSec policy including selector, transform, SA-proposal, and SA.
 - IKE policy (automatic key management).
 - Manual SA (manual SA management).
- Modify existing IPSec and IKE policies.
- Delete existing policies and SAs from the configuration database.

- Flush existing SAs from the kernel SA database (SADB).
- Display policy parameters.

Representation of IP addresses

When configuring IPSec policies, IP addresses and ports must be specified in the following format:

IP address

IPv4 addresses are expressed in dotted decimal notation consisting of numeric characters (0-9) and periods (.), for example, 203.178.141.194.

IPv6 address consist of hexadecimal digits (09afAF), colons (:) and a percent sign (%) if necessary, for example, 2001:200:0:8002:203:47ff:fea5:3085

network prefix

A network prefix is represented by a number followed by a slash (/), for example, 1/0.

NOTES

IPSec configuration changes take effect upon execution and are persistent across reboot.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command does not provide IPSec protection for traffic flows on external management interfaces of intelligent blades in a chassis, nor does it support protection of traffic flows on FCIP interfaces.

This command does not support manipulating preshared keys corresponding to the identity of the IKE peer or group of peers. Use **secCertUtil** to import, delete, or display the preshared keys in the local switch database.

The MD5 hash algorithm is blocked when FIPS mode is enabled.

Refer to the Examples section for specific use cases and associated command sequences. Refer to the Fabric OS Administrator's Guide for configuration procedures.

This command accepts abbreviated operands. The abbreviated string must contain the minimum number of characters necessary to uniquely identify the operand within the set of available operands.

OPERANDS

This command has the following operands:

--enable

Enables IPSec on the switch. Existing IPSec configurations are enabled by this command. IPSec is disabled by default. It must be enabled before you can configure the policies and parameters. The following operand is optional:

default

Clears the existing policies (automatic key management and manual keyed entries) and resets the configuration databases to default values.

--disable

Disables IPSec on the switch. All active TCP sessions are terminated when you disable iPsec.

--add | --modify

Adds or modifies an IPSec or IKE policy in an existing enabled configuration. Not all parameters can be modified. Parameters that cannot be modified are indicated below. When modifying a policy the names and identifiers need to refer to valid existing entities. The syntax is as follows:

--add | --modify type [subtype] [arguments]

type

Specifies the policy to be created. Supported policies include the following:

policy ips

Creates or modifies an IPSec policy. This policy determines the security services afforded to a packet and the treatment of a packet in the network. An IPSec policy allows classifying IP packets into different traffic flows and specifies the actions or transformations performed on IP packets on each of the traffic flows. The main components of an IPSec policy are: IP packet filter/selector (IP address, protocol, and port information) and transform set.

subtype

A *subtype* is required when configuring an IPSec policy. The subtype specifies the components to be configured. The following are required subtypes for the IPSec policy:

selector

Creates a selector that is applied to the IP data traffic. A selector consists of a set of parameters that identify the IP traffic that needs IPSec protection. To configure the selector, the following parameters must be specified:

-tag name

Specifies a name for the selector. This is a user-generated name. The name must be between 1 and 32 characters in length, and may include alphanumeric characters, dashes (-), and underscores (_).

-direction in | out

Specifies traffic flow direction as inbound or outbound.

-local IP_address[prefixlength]

Specifies the source IPv4 or IPv6 address.

-remote IP_address[/prefixlength]

Specifies the peer IPv4 or IPv6 address

-transform name

Specifies the transform to be included in the selector. You must create the transform before you can use in the selector. Use **ipsecConfig --show** policy ips transform to display existing transforms.

-protocol_protocol_name

Specifies the upper layer protocols to be selected for IPSec protection. Valid protocols include **tcp**, **udp**, **icmp** or **any**. When any is specified all existing protocols are selected for protection. This operand is optional.

transform

Creates the IPSec transform set. The transform set is a combination of IPSec protocols and cryptographic algorithms that are applied on the packet after it is matched to a selector. The transform set specifies the IPSec protocol, the IPSec mode, and the action to be performed on the IP packet. It also specifies the key management policy that is needed for the IPSec connection and the encryption and authentication algorithms to be used in security associations when IKE is used as key management protocol. The following operands are required:

-tag name

Specifies a name for the transform. This is a user-generated name. The name must be between 1 and 32 characters in length, and may include alphanumeric characters, dashes (-), and underscores (_).

-mode tunnel | transport

Specifies the IPSec transform mode. In tunnel mode, the IP datagram is fully encapsulated by a new IP datagram using the IPSec protocol. In transport mode, only the payload of the IP datagram is handled by the IPSec protocol inserting the IPSec header between the IP header and the upper-layer protocol header.

-sa-proposal name

Specifies the SA proposal to be included in the transform. You must create the SA proposal first before you can include it in the transform. Use **ipsecConfig --show policy ips sa-proposal -a** for a listing of existing SA proposals.

-action discard | bypass | protect

Specifies the protective action the transform should take regarding the traffic flows.

-ike name

Specifies the IKE policy to be included in the transform. This operand is optional. Use **ipsecConfig --show policy ike -a** for a listing of existing IKE policies.

-local IP_address[/prefixlength]

Specifies the source IPv4 or IPv6 address. This operand is optional. If a local source IP address is defined, a remote peer IP address must also be defined.

-remote IP_address[/prefixlength]

Specifies the peer IPv4 or IPv6 address. This operand is optional. If a remote peer IP address is defined, a local source IP address must also be defined.

sa-proposal

Defines the security associations (SA) proposal, including name, SAs to be included and lifetime of the proposal. The following operands are supported:

-tag name

Specifies a name for the SA proposal. This is a user-generated name. The name must be between 1 and 32 characters in length, and may include alphanumeric characters, dashes (-), and underscores (_).

-sa name[,name]

Specifies the SAs to include in the SA proposal. The bundle consists of one or two SA names, separated by commas. For SA bundles, [AH, ESP] is the supported combination. The SAs must be created prior to being included in the SA proposal. This operand is required.

-Ittime number

Specifies the SA proposal's lifetime in seconds. This operand is optional. If a lifetime is not specified, the SA does not expire. If lifetime is specified both in seconds and in bytes, the SA expires when the first expiration criterion is met.

-Itbyte number

Specifies the SA proposal's lifetime in bytes. The SA expiries after the specified number of bytes have been transmitted. This operand is optional.

sa

Defines the Security Association. An SA specifies the IPSec protocol (AH or ESP), the algorithms used for encryption and authentication, and the expiration definitions used in security associations of the traffic. IKE uses these values in negotiations to create IPSec SAs.

You cannot modify an SA once it is created. Use **ipsecConfig --flush manual-sa** to remove all SA entries from the kernel SA database (SADB) and start over.

-tag name

Specifies a name for the SA. This is a user-generated name. The name must be between 1 and 32 characters in length, and may include alphanumeric characters, dashes (-), and underscores (_). This operand is required.

-protocol ah | esp

Specifies the IPSec protocol. Encapsulating Security Payload (ESP) provides confidentiality, data integrity and data source authentication of IP packets, and protection against replay attacks. Authentication Header (AH) provides data integrity, data source authentication, and protection against replay attacks but, unlike ESP, does not provide confidentiality. This operand is required.

-auth algorithm

Specifies the authentication algorithm. This operand is required. Valid algorithms include the following:

hmac md5

MD5 authentication algorithm

hmac sha1

SHA1 authentication algorithm

-enc algorithm

Specifies the encryption algorithm. This operand is required. Valid algorithms include the following:

3des cbc

3DES encryption algorithm

blowfish_cbc

Blowfish encryption algorithm

null_enc

Null encryption algorithm

aes256_cb

AES-256 algorithm

-spi number

Specifies the security parameter index (SPI) for the SA. This is a user-defined index. Valid SPI numbers consist of numeric characters (0-9). This operand is optional.

policy ike

Creates or modifies an IKE policy configuration. No *subtype* is required with this command. The command defines the following IKE policy parameters: IKE version, IP address of the remote entity, IP address of the local entity, encryption algorithm, hash algorithm, PRF algorithm, DH group, authentication method, path and filename of the preshared key. The syntax is as follows: **ipsecConfig --add | --modify ike** *arguments*.

arguments

Valid arguments for **policy ike** include the following:

-tag name

Specifies a name for the IKE policy. This is a user-generated name. The name must be between 1 and 32 characters in length, and may include alphanumeric characters, dashes (-), and underscores (_). This operand is required.

remote IP_address[/prefixlength]

Specifies the peer IPv4 or IPv6 address and prefix.

-id identifier

Specifies the local identifier. The switch is identified by its IPv4 or IPv6

address.

-remoteid identifier

Specifies the peer identifier. The remote peer is identified by its IPv4 or IPv6

address.

-enc algorithm

Specifies the encryption algorithm. Valid encryption algorithms include the

following:

3des_cbc

DES algorithm

blowfish_cbc

Blowfish algorithm

aes128_cbc

AES 128-bit algorithm

aes256_cbc

AES 256-bit algorithm

null_enc

Null encryption algorithm (cleartext)

-hash algorithm

Specifies the hash algorithm. Valid hash algorithms include the following:

hmac_md5

MD5 algorithm

hmac_sha1

SH1 algorithm

-prf algorithm

Specifies the PFR algorithm. Valid PRF algorithms include the following:

hmac_md5

MD5 algorithm

hmac_sha1

SH1 algorithm

-auth psk | dss | rsasig

Specifies the authentication method as one of the following:

psk

Authenticate using preshared keys.

dss

Authenticate using digital signature standard.

rsasig

Authenticate using an RSA signature.

-dh number

Specifies the DH group number as one of the following:

1

Specifies DH group modp768.

2

Specifies DH group modp1024.

14

Specifies DH group modp2048.

The following operands are optional (use **secCertUtil** to import the key files to the local and remote systems)

-psk file

Specifies the preshared key filename.

-pubkey file

Specifies the public key filename (in X.509 PEM format).

-privkey file

Specifies the private key filename (in X.509 PEM format).

-peerpubkey file

Specifies the peer public key filename (in X.509 PEM format).

-Ittime number

Specifies the key lifetime in seconds. If a lifetime is not specified, the keys do not expire. If a lifetime is specified both in seconds and in bytes, the keys expire when the first expiration criterion is met.

-Itbyte number

Specifies the key lifetime in bytes. The keys expire after the specified number of bytes have been transmitted.

-pfs on | off

Enables or disables Perfect Forward Secrecy (PFS). PFS is disabled by default. When PFS is disabled, IKE uses the initial master key it generates in Phase1 to generate the keys for SA connections in Phase2. When PFS is enabled, a new key is generated for keying the SAs. Enabling PFS may provide enhanced protection against keys compromise.

-version 1 | 2

Specifies the IKE version. This operand is optional. If not specified, IKEv2 is used (2). If 1 is specified, IKEv1 is selected. Use **-v** 2 to revert to version 2 after version 1 was set.

manual-sa

Creates manually keyed SADB entries. When using this option, you must generate the keys manually, The lifetime of an SA entry created using this command is infinite. You cannot modify manually keyed SA entries. Use <code>ipsecConfig --flush</code>, or <code>ipsecConfig --delete</code> and recreate the entries. The syntax for creating an SADB entry is as follows:

ipsecconfig --add manual-sa arguments.

arguments

Valid arguments for **manual-sa** include the following:

-sp number

Specifies the security parameter index (SPI) for the SA. This is a user-defined index. Valid SPI numbers consist of numeric characters (0-9).

-local ipaddress

Specifies the local IPv4 or IPv6 address.

-remote ipaddress

Specifies the remote IPv4 or IPv6 address.

-protocol_name

Specifies the upper layer protocols to be selected for protection. Valid protocols include **tcp**, **udp**, **icmp** or **any**. When any is specified all existing protocols are selected for protection.

-ipsec ah | esp

Specifies the IPSec protocol. Encapsulating Security Payload (ESP) provides confidentiality, data integrity and data source authentication of IP packets, and protection against replay attacks. Authentication Header (AH) provides data integrity, data source authentication, and protection against replay attacks but, unlike ESP, does not provide confidentiality.

-action discard | bypass | protect

Specifies the IPSec protection type regarding the traffic flows.

-direction in | out

Specifies traffic flow direction as inbound or outbound.

-mode tunnel | transport

Specifies the IPSec mode. In tunnel mode, the IP datagram is fully encapsulated by a new IP datagram using the IPSec protocol. In transport mode, only the payload of the IP datagram is handled by the IPSec protocol; it inserts the IPSec header between the IP header and the upper-layer protocol header.

-enc algorithm

Specifies the encryption algorithm. Valid encryption algorithms include the following:

3des_cbc

3DES algorithm

null_enc

Null encryption algorithm (cleartext)

-auth algorithm

Specifies the authentication algorithm. Valid authentication algorithms include the following:

hmac_md5

MD5 algorithm

hmac_sha1

SH1 algorithm

-enc-key number

Specifies the encryption key. This is a user-generated key based on the length of the key. Use the LINUX random key generator or any other comparable third party utility to generate the manual SA keys. Refer to the *Fabric OS Administrator's Guide* for details.

- A 192-bit value for the 3des_cbc encryption algorithm, for example, 0x96358c90783bbfa3d7b196ceabe0536b
- A zero-bit value for the **null_enc** encryption algorithm.

-auth-key number

Specifies the authentication key. This is a user-generated key based on the length of the key. Valid keys include the following:

- A 128-bit value for the hmac_md5 authentication algorithm.
- A 160-bit value for the hmac_sha1 authentication algorithm.

The following operands are optional:

tunnel-local ipaddress

Specifies the local tunnel IPv4 or IPv6 address.

tunnel-remote ipaddress

Specifies the peer tunnel IPv4 or IPv6 address.

--delete

Deletes a specified policy or all policies of a certain *type*from the configuration database. You can delete IPSec policies, IKE policies, and SADB entries. When deleting IPSec policies, you have the option to delete specific components only, such as the transform or the selector, and recreate these components without having to recreate the entire policy. The syntax for deleting a policy is as follows:

ipsecconfig --delete type [subtype] arguments

type

Specifies the policy to be deleted. Valid policy types include the following:

policy ips

Deletes a specified IPSec policy or all IPSec policies.

subtype

Optionally specify a component (*subtype*) to delete the component only:

selector

Deletes the selector for a specified IPSec policy, or all selectors of all

configured IPSec policies.

transform

Deletes the transform for a specified IPSec policy, or all transforms of all

configured IPSec policies.

sa-proposal

Deletes the SA proposal for a specified IPSec policy, or all SA proposals of all

configured IPSec policies.

sa

Deletes the SAs for a specified IPSec policy, or all SAs of all configured

IPSec policies.

policy ike

Deletes a specified IKE policy or all configured IKE policies.

sa

Deletes a specified SADB entry or all manual SADB entries.

manual-sa

Deletes the SA policy entries used in manually keyed SA entries from the

configuration database.

arguments

Specifies the selection as one of the following:

-a

Deletes all configuration information for the specified *type* and *subtype*.

-tag name

Deletes all configuration information for the specified policy type

--flush manual-sa

Flushes all SA entries (including manually keyed and automatically keyed SAs) from the kernel SADB. All active TCP sessions that are using IPSec protection are terminated when this command is executed. This command, unlike delete, does not remove the policies from the configuration database. Flushing any other policy

parameters is not supported.

--show

Displays current IPSec or IKE configuration. The syntax for the display option is as follows:

--show type [subtype] arguments

type

Specifies the policy to be displayed. Valid values for type include the following:

policy ips

Displays the IPSec policy configuration. A policy *subtype* must be specified when displaying the IPSec policy configuration. Valid subtypes include the following:

selector

Displays IPSec selector parameters including IPSec policy name, IP address of the local entity, IP address of the remote entity, direction of traffic flow (inbound or outbound), upper layer protocol used, and IPSec transform index.

transform

Displays IPSec transform parameters including IPSec policy name, key management protocol (version) or manual SA, processing option for selected IP traffic, IPSec mode (tunnel or transport), IP address of the local entity, IP address of the remote entity, and SA proposal.

sa-proposal

Displays the parameters of the SA proposal, including proposal name, lifetime (in seconds and in byte units, or infinite), and associated SA definitions.

sa

Displays security association (SA) parameters for the specified IPSec policies including policy names, IPSec protocol used (AH or ESP), encryption and authentication algorithms.

policy ike

Displays the IKE policy configuration. No *subtype* is required with this command. The command displays the following IKE policy parameters: IKE version, IP address of the remote entity, IP address of the local entity, encryption algorithm, hash algorithm, PRF algorithm, DH group, authentication method, path and filename of the preshared key.

manual-sa

Displays the Security Associations in the local SADB. No *subtype* is required with this command.

arguments

Specifies the display selection as one of the following:

-a

Displays all configuration information for the specified type and subtype.

-tag name

Displays configuration information for the specified IPSec policy only.

--help

Displays the command usage. Optionally use **--help** with a specified command, type, and subtype to display the syntax for specific commands. Do not include a double dash when specifying the command.

EXAMPLES Example 1

The following example illustrates how to secure traffic between two systems using AH protection with MD5 and configure IKE with preshared keys. The two systems are a switch, BROCADE300 (IPv4 address 10.33.74.13), and an external UNIX server (10.33.69.132).

1. On the system console, log in to the switch as Admin and enable IPSec.

switch:admin> ipsecconfig --enable

2. Create an IPSec SA policy named AH01, which uses AH protection with MD5.

```
switch:admin> ipsecconfig --add policy ips sa \
     -t AH01 -p ah -auth hmac_md5
```

3. Create an IPSec proposal IPSEC-AH to use AH01 as SA.

```
switch:admin> ipsecconfig --add policy ips sa-proposal \
     -t IPSEC-AH -sa AH01
```

4. Configure the SA proposal's lifetime in time units.

```
switch:admin> ipsecconfig --add policy ips sa-proposal \
     -t IPSEC-AH -lttime 280000 -sa AH01
```

- 5. Import the preshared key file (e.g., ipseckey.psk) using the seCcertUtil import command.
- 6. Configure an IKE policy for the remote peer.

```
switch:admin> ipsecconfig --add policy ike -t IKE01 \
     -remote 10.33.69.132 -id 10.33.74.13 \
     -remoteid 10.33.69.132 -enc 3des cbc \
     -hash hmac md5 -prf hmac md5 -auth psk \
     -dh modp1024 -psk ipseckey.psk
```

7. Create an IPSec transform named TRANSFORM01 to use transport mode to protect traffic identified for IPSec protection and use IKE01 as the key management policy.

```
switch:admin> ipsecconfig --add policy ips transform \
     -t TRANSFORM01 -mode transport \
     -sa-proposal IPSEC-AH -action protect -ike IKE01
```

8. Create traffic selectors to select the outbound and inbound traffic that needs to be protected.

```
switch:admin> ipsecconfig --add policy ips selector
     -t SELECTOR-OUT -d out -1 10.33.74.13 -r 10.33.69.132 \
     -transform TRANSFORM01
switch:admin> ipsecconfig --add policy ips selector \
   -t SELECTOR-IN -d in -l 10.33.69.132 -r 10.33.74.13 \
-transform TRANSFORM01
```

- 9. Verify the IPSec SAs created using IKE for above traffic flow using ipsecConfig --show manual-sa -a. Refer to the "IPSec display commands" section for an example.
- 10. Perform the equivalent steps on the remote peer to complete the IPSec configuration. Refer to your server administration guide for instructions.

Example 2

The following example illustrates how to secure traffic between two systems using ESP protection with 3DES_CBC encryption and SHA1 authentication, and how to configure IKE with RSA Certificates signed by the certification authority (CA). The two systems are A SWITCH, BROCADE300 (IPv6 address fe80::220:1aff:fe34:2e82), and an external UNIX host (IPv6 address fe80::205:1fff:fe51:f09e).

1. On the system console, log in to the switch as Admin and enable IPSec.

```
switch:admin> ipsecconfig --enable
```

2. Create an IPSec SA policy named ESP01, which uses ESP protection with 3DES and SHA1.

```
switch:admin> ipsecconfig --add policy ips sa -t ESP01 \
     -p esp -enc 3des_cbc -auth hmac_sha1
```

3. Create an IPSec proposal IPSEC-ESP to use ESP01 as the SA.

```
switch:admin> ipsecconfig --add policy ips sa-proposal \
   -t IPSEC-ESP -sa ESP01
```

4. Configure the SA proposal lifetime in seconds.

```
switch:admin> ipsecconfig --add policy ips sa-proposal \
   -t IPSEC-ESP -lttime 280000 -sa ESP01
```

5. Import the public key for the BROCADE300 (Brocade300.pem), the private key for BROCADE300 (Brocade300-key.pem), and the public key of the external host (remote-peer.pem) in X.509 PEM format from the remote certificate server (10.6.103.139).

```
switch:admin> seccertutil import -ipaddr 10.103.6.139 \
    -remotedir /root/certs -certname Brocade300.pem

switch:admin> seccertutil import -ipaddr 10.103.6.139 \
    -remotedir /root/certs -certname Brocade300-key.pem

switch:admin> seccertutil import -ipaddr 10.103.6.139 \
    -remotedir /root/certs -certname remote-peer.pem
```

Import the CA certificate that was used to sign the public certificates of BROCADE300 and the remote peer as IPSECCA.pem.

```
switch:admin> seccertutil import -ipaddr 10.103.6.139 \
    -remotedir /root/certs -certname IPSECCA.pem
```

7. Configure an IKE policy for the remote peer UNIX host.

```
switch:admin> ipsecconfig --add policy ike -t IKE01 -remote \
    fe80::205:1fff:fe51:f09e -id fe80::220:laff:fe34:2e82 \
    -remoteid fe80::205:1fff:fe51:f09e \
    -enc 3des_cbc -hash hmac_md5 -prf hmac_md5 -auth rsasig \
    -dh modp1024 -pubkey "Brocade300.pem" \
    -privkey "Brocade300-key.pem" -peerpubkey "remote-peer.pem"
```

8. Create an IPSec transform TRANSFORM01 to use transport mode to protect traffic identified for IPSec protection and use IKE01 as the key management policy.

```
switch:admin> ipsecconfig --add policy ips transform \
   -t TRANSFORM01 -mode transport -sa-proposal IPSEC-ESP \
   -action protect -ike IKE01
```

9. Create traffic selectors to select outbound and inbound TCP traffic that needs to be protected.

```
switch:admin> ipsecconfig --add policy ips selector \
    -t SELECTOR-OUT -d out -l fe80::220:laff:fe34:2e82 \
    -r fe80::205:lfff:fe51:f09e \
    -protocol "tcp" -transform TRANSFORM01

switch:admin> ipsecconfig --add policy ips selector \
    -t SELECTOR-IN -d in -l fe80::205:lfff:fe51:f09e -r \
    fe80::220:laff:fe34:2e82 -protocol "tcp" -t transform TRANSFORM01
```

- Verify the IPSec SAs using ipSecConfig --show manual-sa -a. Refer to the "IPSec display commands" section for an example.
- 11. Perform the equivalent steps on the remote peer to complete the IPSec configuration. Refer to your server administration guide for instructions.

Example 3

The following example illustrates how to secure traffic between two systems using AH with SHA1 and ESP protection with 3DES and configure IKE with preshared keys. The two systems are a switch, a Brocade 300 (IP address 10.33.74.13), and an external UNIX host (IPv4 address 10.33.69.132).

1. On the system console, log in to the switch as Admin and enable IPSec.

```
switch:admin> ipsecconfig --enable
```

2. Create an IPSec SA policy named AH01, which uses AH protection with SHA1.

```
switch:admin> ipsecconfig --add policy ips sa \
     -t AH01 -p ah -auth hmac_sha1
```

Create an IPSec SA policy named ESP01, which uses ESP protection with 3DES.

```
switch:admin> ipsecconfig --add policy ips sa \
     -t ESP01 -p esp -enc 3des_cbc
```

4. Create an IPSec proposal IPSEC-AHESP to use an AH01 and ESP01 bundle.

```
switch:admin> ipsecconfig --add policy ips sa-proposal \
     -t IPSEC-AHESP -sa AH01,ESP01
```

- 5. Import the preshared key file (e.g., ipseckey.psk) using the **secCertUtil import** command.
- 6. Create an IKE policy for the remote peer.

```
switch:admin> ipsecconfig --add policy ike -t IKE01 \
     -remote 10.33.69.132 -id 10.33.74.13 \
     -remoteid 10.33.69.132 -enc 3des_cbc \
     -hash hmac_md5 -prf hmac_md5 \
     -auth psk -dh modp1024 -psk ipseckey.psk
```

7. Create an IPSec transform TRANSFORM01 configured with transport mode to protect traffic identified for IPSec protection and use IKE01 as a key management policy.

```
switch:admin> ipsecconfig --add policy ips transform \
     -t TRANSFORM01 -mode transport -sa-proposal IPSEC \
     -AHESP -action protect -ike IKE01
```

8. Create traffic selectors to protect outbound and inbound traffic.

```
switch:admin> ipsecconfig --add policy ips selector
     -t SELECTOR-OUT -d out -1 10.33.74.13 -r 10.33.69.132 \
     -transform TRANSFORM01
switch:admin> ipsecconfig --add policy ips selector \
     -t SELECTOR-IN -d in -1 10.33.69.132 -r 10.33.74.13 \
     -transform TRANSFORM01
```

- 9. Verify the IPSec SAs using **ipSecConfig --show manual-sa -a**. Refer to the "IPSec display commands" section for an example.
- 10. Perform the equivalent steps on the remote peer to complete the IPSec configuration. Refer to your server administration guide for instructions.

Example 4

The following example illustrates how to secure traffic between two systems using protection with MD5 and Manually keyed SAs. The two systems are a switch, the BROCADE300 (IPv4 address 10.33.74.13), and an external UNIX host (IPv4 address 10.33.69.132).

1. On the system console, log in to the switch as Admin and enable IPSec.

```
switch:admin> ipsecconfig --enable
```

2. Create an IPSec Manual SA that uses AH protection with MD5 for outbound traffic:

```
switch:admin> ipsecconfig --add manual-sa -spi 0x300 \
   -1 10.33.74.13 -r 10.33.69.132 -p any -d out -m transport \
   -ipsec ah -ac protect -auth hmac_md5 \
   -auth-key "TAHITEST89ABCDEF"
```

Create an SA for inbound traffic.

```
switch:admin> ipsecconfig --add manual-sa -spi 0x200 \
   -1 10.33.69.132 -r 10.33.74.13 -p any -d in \
   -m transport -ipsec ah -ac protect -auth hmac_md5 \
   -auth-key "TAHITEST89ABCDEF"
```

- 4. Verify the SAs using **ipsecConfig --show manual-sa -a**. Refer to the IPSec display commands section for an example.
- Perform the equivalent steps on the remote peer to complete the IPSec configuration. Refer to your server administration guide for instructions.

IPSec display commands

To display the IPSec IKE Policy:

```
switch:admin> ipsecconfig --show policy ike -a
IKE-01  version:ikev2 remote:10.33.69.132
  local-id:10.33.74.13  remote-id:10.33.69.132
  encryption algorithm: 3des_cbc
  hash algorithm: hmac_md5
  prf algorithm: hmac_md5
  dh group: 2 1
  auth method:rsasig
  public-key:"/etc/fabos/certs/sw0/thawkcert.pem"
  private-key:"/etc/fabos/certs/sw0/thawkkey.pem"
  peer-public-key:"/etc/fabos/certs/sw0/spiritcert.pem
```

To display the outbound and inbound SAs in the kernel SA database:

```
switch:admin> ipsecconfig --show manual-sa -a
10.33.69.132[0] 10.33.74.13[0]
 ah mode=transport spi=34560190(0x020f58be) reqid=0(0x00000000)

isIShow

Displays interswitch link (ISL) information.

SYNOPSIS

isIshow

DESCRIPTION

Use this command to display the current connections and status of the interswitch link (ISL) for each port on a switch. The command output includes the following information:

- Node world wide name (WWN)
- Domain ID
- Switch name
- ISL connection speed, if applicable
- Bandwidth
- Trunking enabled, if applicable
- QoS enabled, if applicable
- Encryption enabled, if applicable
- Compression enabled, if applicable

When issued on a switch that is part of a logical fabric configuration, the islShow command displays logical interswitch links (LISLs) along with regular ISLs. However, speed (sp) displays N/A for logical ports. The bandwidth (bw) displayed is the sum of the bandwidth of all extended ISLs (XISLs) that form the LISL. A shared ISL (XISL) connects the base switches and is shared by different logical fabrics. It allows devices to communicate with each other within the logical fabric.

Connection speed is not applicable to LE_Ports or VE_Ports. For these port types, speed displays as "sp:----".

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To execute **islshow** in a base fabric:

```
switch:user> islshow
1: 2->300 10:00:00:05:1e:43:00:00 100 DCX \
    sp: 8.000G bw: 32.000G TRUNK QOS
  8-> 3 10:00:00:05:1e:41:8a:d5 30 B5300\
    sp: 4.000G bw: 16.000G TRUNK QOS
3: 19-> 10 10:00:00:05:1e:41:43:ac 50 B300 sp:\
    8.000G bw: 64.000G TRUNK
```

To execute **islshow** in a logical fabric:

```
switch:user> islshow
1: 33-> 29 10:00:00:60:69:80:4f:84
                                    3 B3200 \
   sp: 2.000G bw: 4.000G TRUNK
2: 39-> 7 10:00:00:60:69:45:68:04
                                    4 B3850 \
   sp: 2.000G bw: 8.000G TRUNK
3: 41-> (incompatible)
4: 47-> (incompatible)
5: 95-> 0 10:00:00:05:1e:01:0b:4a 15 B5100 \
   sp: 2.000G bw: 2.000G TRUNK
```

```
6:162->160 10:00:00:60:69:e2:09:fa 5 B2400 \
sp:----- bw: 0.001G
7:384-> 16 10:00:00:05:1e:37:02:73 39 DCX \
sp:----- bw: 10.000G
8:385-> 16 10:00:00:05:1e:37:02:73 43 B53000 \
sp:----- bw: 11.000G
```

To display interswitch links with encryption or compression enabled:

itemList

Lists parameter syntax information.

SYNOPSIS

```
item_list = element | element white item_list
element = item | item - item
item = num | slot [white]/ [white] num
slot = num
num = hex | int
int = int digit | digit
hex = 0x hex digit | hex hex digit
```

digit = 0|1|2|3|4|5|6|7|8|9

hex digit = digit |A|B|C|D|E|F|a|b|c|d|e|f

white = *["\\t\\f\\r ,"]

DESCRIPTION

All kernel diagnostics have at least one item list parameter to specify which ports to test. The normal default value for this parameter is to select everything.

This is not a command; rather, it is a common parameter to many commands.

If you want to restrict the items to be tested to a smaller set, the parameter value is an item list with the following characteristics:

- It is a comma-separated list of items.
- Each item in the list can be a single element or a range of elements separated by a dash character or a combination of both. For example, "0,3,4-6,1", "0,1,3,4,5,6", and "0 3 4 6 1" each select items 0, 1, 3, 4, 5, 6, and 7.
- Spaces and tab stops are skipped.
- Each item might be proceeded by an optional slot number followed by a slash ("/").

Besides the syntax rules, there are also some grammatical restrictions on the slot numbers:

- Once specified, a slot selection applies to all items to the right of the slot selections until the next slot selection or the end of the item list. For example, "1/0 - 15" and "1/0 - 1/15" are equivalent.
- If no slot number is specified, user port lists are specified by area number. For instance,"0, 16, 32" and"1/0, 2/0, 3/0" specify the same ports on a 16-port/blade system. On that same system,"1/0, 16, 32" is not a valid list: even though it is legal syntax, the ports do not exist.
- If no slot number is specified, all lists except user port lists use the default slot 0.
- No list type except for user port lists may specify multiple conflicting slot numbers. For instance, "1/0, 2/0, 3/0" is a valid user port list but is not valid for any other type of list.

In the case of conflicting settings within a single item list, an error is generated, as described earlier. In the case of multiple item list parameters, the last one on the command line overrides previous settings.

The exact type of list varies, depending on the test and the parameter; however, the most common are blade ports and user ports. A list of blade ports is most commonly used by ASIC-level tests such as **turboRamTest** and represents which ports on the current blade (specified with **--slot** *number*) are tested. A list of user ports is used by higher-level tests to specify which user-accessible external ports

within the current switch (selected during Telnet login) are tested. When specified in an item list, user ports might be specified by either the area portion of the ports Fibre Channel address or with *slotl port* notation. For nonblade systems, the port number on the silkscreen is the area number, so the two notations are identical.

For item list parameters, the parameter type is PT_LIST and the list type is one of the following:

Type	Grouping	Description
BPORTS	Blade	Blade ports, internal and external ports.
UPORTS	Switch	User ports, ports with external connections.
QUADS	Blade	Quadrants, group of (normally 4) ports.
CHIPS	Blade	Chips, Asics within a blade.
MINIS	Blade	Mini switches.
SLOTS	Chassis	Slots.
INDEX	N/A	Anything.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

killTelnet

Terminates an open Telnet session.

SYNOPSIS

killtelnet

DESCRIPTION

Use this command to terminate an open Telnet session. The command lists all current Telnet and serial port login sessions and information such as session number, login name, idle time, IP address of the connection, and timestamp of when the login session was opened. The command prompts you to specify the number of the session you want to terminate. The list of open sessions displayed with killTelnet includes your current session; be sure not kill your own Telnet session.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

EXAMPLES

To terminate an open Telnet connection:

switch:admin> killtelnet Collecting login information....Done List of telnet sessions (3 found)

IdapCfg

Maps LDAP AD server roles to default switch roles.

SYNOPSIS

Idapcfg --maprole Idaprole switchrole

Idapcfg --unmaprole Idaprole

Idapcfg --show

Idapcfq --help

DESCRIPTION

Use this command to map a Lightweight Directory Access Protocol (LDAP) Active Directory (AD) server role to one of the default roles available on a switch. This command also provides an option to remove an existing mapping.

This command creates an alias for a customer-defined group which allows a user belonging to that group to login to the switch with the permissions associated with the mapped switch role.

This command supports one-to-one role mapping only. For example, you might map the "SAN administrator" role on the AD server to the "admin" role on the switch, or the "SAN maintenance" role to the switch "operator" role. But the command fails if you attempt to map an already mapped AD server role.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command takes as input an action and its associated arguments. When no operand is specified, the command prints the usage.

This command has the following operands:

--maprole

Maps an LDAP role to a specified switch role. The following operands are required:

Idaprole

Specifies the LDAP role to be mapped to a switch role. The role must be a valid AD server role.

switchrole

Specifies the switch role to which the LDAP role is mapped. Valid switch roles include the following:

- admin
- user
- switchadmin
- zoneadmin
- fabricadmin
- basicswitchadmin
- operator
- securityadmin

--unmaprole

Removes the mapping between an LDAP role and a switch role. Use the --show

option for a listing of existing mappings. The following operand is required:

Idaprole

Specifies the LDAP AD sever role to be removed from the mapping.

--show

Displays a table of existing mappings between LDAP roles and their

corresponding switch role.

--help

Displays the command usage.

EXAMPLES

To display current LDAP and switch role map:

switch:admin>	ldapcfg	show	
LDAP Role		Switch Role	
ldapadmin		admin	
ldapuser		user	
SANfabadmin		fabricadmin	
SANzoneadmin		zoneadmin	
SANoperator		operator	
${\tt LDAPSANsecadm}$		securityadmin	
SANuser		user	
SAN01secadmin		securityadmin	
LD_02zoneadmin	ı	zoneadmin	

To map an LDAP AD server role to the switch role of "operator":

```
switch:admin> ldapcfg --maprole SANoperator operator
LDAP role SANoperator has been successfully mapped.
switch:admin> ldapcfg --unmaprole SANoperator
LDAP role SANoperator has been successfully unmapped.
```

SEE ALSO aaaConfig, userConfig

IfCfg

Configures and displays logical fabrics.

SYNOPSIS

Ifcfg [--show | --showall] -cfg

Ifcfg [--show | --showall] -lisl [-v]

Ifcfg [--show -xisl [s/ot/]port | --showall -xisl

Ifcfg --lislenable

Ifcfg --help

DESCRIPTION

Use this command to display logical fabric configuration information, to determine the status of logical interswitch links (LISLs), to enable LISLs between logical switches, and to display information about the XISLs and LISLs associated with each XISL.

A logical switch is a partition created on a physical switch that shares the physical resources of the base fabric while functioning as an independent entity in a "virtual" logical fabric. The logical fabric sits on top of a base physical fabric and ties otherwise disconnected logical switches together to share the same connectivity and physical resources. At the same time, the logical fabric provides protocol and management isolation, and each logical fabric is independently scalable.

The display options provided with this command show the logical fabric configuration for a given logical switch context or for a chassis context. Each logical switch displays only the user ports that are configured to be part of that switch instance. The switch context is defined by the fabric ID. The default context is the base logical switch that you are placed in upon login. The default logical switch context is defined by the fabric ID 128. To change the context, use the **setContext** command.

When issued with the **-cfg** option, this command displays the following information:

Chassis

Numeric identifier for the chassis.

Chassis WWN

Chassis world wide name.

Base switch Domain

The domain ID of the base switch.

For each logical switch, the following information is displayed:

Logical Switch

Numeric identifier for the logical switch within the chassis.

Base switch

Yes or No. This field indicates whether or not this logical switch is the base switch.

Fabric Id

The logical switch fabric ID (FID).

State

The state of the logical switch: Online or Offline.

Switch WWN

The logical switch world wide name.

When issued with the **-lisl** option, the command displays the following information:

FID

Fabric ID of the logical switch.

Port

Number of the logical LISL port.

remote-domain

Domain ID of the base switch in the remote chassis.

Name

Switch name.

State

Port state: Online or Offline.

Associated physical ports

Physical ports associated with the LISL ports.

When IfCfg is issued within a logical switch context, only the configuration regarding that switch and the fabrics reachable from that switch is displayed. When the command is issued in a chassis context the information for all chassis in the base fabric reachable from the current chassis is displayed. Executing chassis-level commands requires chassis permissions. Refer to the userConfig command for information on setting chassis user permissions.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only on hardware platforms that are Virtual Fabric-aware and run Fabric OS v6.2.0 or later. Refer to the Fabric OS Administrator's Guide for specific hardware support.

You cannot use the portEnable command on logical ports. Use Ifcfg with the --lislenable option to re-enable disabled LISL ports on a logical switch.

OPERANDS

This command has the following operands:

--show -cfg

Displays information for the fabric ID set by the context in all chassis reachable

from the base fabric.

--showall -cfg

Displays information for all fabrics in all chassis reachable from the chassis context in which the command is executed. This option requires chassis

permissions.

--show -list

Displays status information about the LISLs in the logical switch set by the

context.

--showall -lisl

Displays status information of all LISLs in the chassis. This option requires chassis permissions.

-v

Displays, in addition to the LISLs, the physical ports on the base switch that are associated with the LISL ports. This operand is optional with the **-lisl** option.

--show -xisl [slot/]port

Displays the XISL and the LISLs associated with it for the specified XISL port. For each LISL port, the output displays the FID, LISL State (online/offline) and the local and remote logical switch WWNs. This command must be executed from the base switch.

--showall -list

Displays the XISL connections between two base switches for all XISL ports. This command must be executed from the base switch.

--lislenable

Re-enables all LISLs in the fabric that were disabled because of some conflict or error condition in the fabric. This command provides the option of manually reestablishing the LISLs after the error condition has been resolved.

--help

Displays the command usage.

EXAMPLES To display logical fabric information for FID 2 in all chassis reachable from the base fabric.

switch:admin> lfcfg --show -cfg

To display information for all fabrics in all chassis reachable from the base fabric:

```
switch:admin> lfcfg --showall -cfg
----- Chassis: 1 -----
Chassis WWN: 10:00:00:05:1e:39:82:64
Number of Partitions: 2
Base switch domain: 1
  Logical switch: 2 Base switch: YES
  State: Online(1)
                   Switch WWN: 10:00:00:05:1e:39:81:67
  Logical Switch: 1 Base switch: NO
                                        Fabric Id: 1
  State: Online(1)
                   Switch WWN: 10:00:00:05:1e:39:81:66
----- Chassis: 2 ------
Chassis WWN: 10:00:00:05:1e:0b:a4:5e

SEE ALSO None

licenseAdd

Adds a license key to a switch.

SYNOPSIS I

licenseadd license

DESCRIPTION

Use this command to add a license key to a switch.

Some features of the switch and the fabric to which it is connected are optional, licensed products. Without a valid license installed for such products, their services are not available.

A license key is a string of any length consisting of upper- and lowercase letters and numbers. License keys are case-sensitive. The license must be entered exactly as issued. The system may accept an incorrectly entered license, but the licensed products will not function. After entering the license, use the **licenseShow** command to validate the product associated with the license. If no licensed products are shown, the license is invalid.

After you enter a license, the licensed product is generally available immediately without requiring further action. The following exceptions apply:

- Some licenses may require you to refresh the ports before to activate the license. Depending on your system, use the portDisable/portEnable, switchDisable/switchEnable or chassisDisable/chassisEnable commands to refresh the ports.
- Some licenses may require that you reboot the switch to activate the license. The licenseAdd command will prompt you to reboot the switch.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

license

Specifies the license key to be installed. This operand is required.

EXAMPLES

To add a license key to the switch:

switch:admin> licenseadd DXXtN3LmRSMWCSW3XmfSBPfrWKLZ3HMTN73rP9GANJMA
adding license-key [DXXtN3LmRSMWCSW3XmfSBPfrWKLZ3HMTN73rP9GANJMA]

SEE ALSO licenseAdd, licenseIdShow, licensePort, licenseRemove, licenseSlotCfg, licenseShow

licenseldShow

Displays the system license ID.

SYNOPSIS licenseidshow

DESCRIPTION Use this command to display the license ID of the system.

Some features of the switch and the fabric are optional, licensed products. Without a license installed for such products, the services provided by these features are not available.

This command displays the system license ID used for generating and validating licenses on the system. The license ID format consists of eight pairs of hexadecimal values, separated by colons. Each hexadecimal value is between 00 (0) and FF (255).

NOTES

While the format of this identifier might be similar or even identical to other identifiers in the system, no inferences should be made about the relationships between them as they are subject to change independently of one another.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display the license ID:

switch:admin> licenseidshow

licensePort

Manages Dynamic Ports On Demand (DPOD) licenses.

SYNOPSIS licenseport --release port

licenseport --reserve port

licenseport --show

licenseport --method dynamic | static

DESCRIPTION

Use this command to manage and display Dynamic Ports on Demand (DPOD) license assignments.

Dynamic Ports On Demand (DPOD) is an optional feature available on all embedded platforms. DPOD takes the expansion capability of static Ports On Demand (POD) and adds the flexibility of activating any available port as long as a valid license is available. In Static mode, POD allows only specific fixed ports to be activated or licensed. With DPOD, any physical port can be made active as long as the total number of licenses is not exceeded.

The Dynamic POD feature assigns ports to the POD license in the order in which they come online until they equal the number of online licensed ports. This command provides the mechanism to make adjustments to the dynamic assignments by reserving assignments for specific ports in the event that there are more online ports than the purchased POD licenses can support.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is valid only on embedded platforms. On unsupported platforms, this command returns a "not supported" message.

OPERANDS

This command has the following operands:

port

Specifies the number of the port to which to assign or from which to remove a POD license. A port must be specified when releasing or reserving a port.

--release

Releases a license assignment from the specified port when the switch is using the Dynamic POD method. The port must be offline for this command to succeed.

--reserve

Reserves a license assignment for the specified port when the switch is using the Dynamic POD method. The port must be offline for this command to succeed.

--show

Displays the POD license assignments.

--method

Selects the POD method as one of the following:

dynamic

Selects the dynamic POD method.

static

Selects the static POD method.

EXAMPLES To activate Dynamic Ports On Demand:

```
switch:admin> licenseport --method dynamic
The POD method has been changed to dynamic.
Please reboot the switch now for this change to take effect.
```

To release a port from a Dynamic POD license assignment and to display the assignments:

```
switch:admin> licenseport --release 22
switch:admin> licenseport --show
24 ports are available in this switch
 1 POD license is installed
    Dynamic POD method is in use
 24 port assignments are provisioned for use in this switch:
 12 port assignments are provisioned by the base switch license
 12 port assignments are provisioned by the first POD license
 * O more assignments are added if the second POD license
     is installed
 23 ports are assigned to installed licenses:
 12 ports are assigned to the base switch license
 11 ports are assigned to the first POD license
 Ports assigned to the base switch license:
  1, 2, 3, 5, 6, 7, 8, 10, 11, 14, 15, 19
 Ports assigned to the first POD license:
  0, 4, 9, 12, 13, 16, 17, 18, 20, 21, 23
 Ports assigned to the second POD license:
  None
 Ports not assigned to a license:
 1 license reservation is still available for use by unassigned ports.
```

To reserve a Dynamic POD license assignment for a port and to display the assignments:

```
switch:admin> licenseport --reserve 5
switch:admin> switch:admin> licenseport --show
 24 ports are available in this switch
 1 POD license is installed
   Dynamic POD method is in use
 24 port assignments are provisioned for use in this switch:
   12 port assignments are provisioned by the base switch license
  12 port assignments are provisioned by the first POD license
  * 0 more assignments are added if the second POD license \setminus
    is installed
 24 ports are assigned to installed licenses:
   12 ports are assigned to the base switch license
   12 ports are assigned to the first POD license
 Ports assigned to the base switch license:
   1, 2, 3, 5, 6, 7, 8, 10, 11, 14, 15, 19
 Ports assigned to the first POD license:
   0, 4, 9, 12, 13, 16, 17, 18, 20, 21, 22*, 23
 Ports assigned to the second POD license:
 Ports not assigned to a license:
   None
 O license reservations are still available for use by unassigned ports
 1 license assignment is held by an offline port (indicated by *)
```

To disable Dynamic Ports On Demand:

switch:admin> licenseport --method static The POD method has been changed to static. Please reboot the switch now for this change to take effect.

SEE ALSO licenseAdd, licenseHelp, licenseRemove, licenseShow, licenseShow

licenseRemove

Removes or deactivates a license key.

SYNOPSIS licenseremove license

DESCRIPTION

Use this command to remove an existing license key from a switch or to deactivate the license key. The existing license key must be entered exactly as shown by the **licenseShow** command. License keys are case-sensitive.

When the key has been removed, use the **licenseShow** command to verify that the key and the associated product have been uninstalled. You must reboot the switch after removing a license. For a switch that has no licenses installed, **licenseShow** displays "No licenses."

Upgradable licenses, such as slot-based licenses or Universal Time-based licenses cannot be permanently removed; they remain in the database but are not displayed in the **licenseShow** output.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operand is required:

license

Specifies the license key to be removed or deactivated. This operand is required.

EXAMPLES

To remove a license key from the switch:

switch:admin> licenseremove \

```
switch:admin> licenseremove bQebzbRdScRfc0iK
removing license key [bQebzbRdScRfc0iK]
```

To deactivate a slot-based license:

```
removing license-key \

SEE ALSO licenseAdd, licenseHelp, licenseIdShow, licenseShow

licenseShow

Displays current license keys.

SYNOPSIS licenseshow

DESCRIPTION

Use this command to display current license keys, along with a list of licensed products enabled by these keys. Depending on the type of license, this command displays the following information:

Permanent licenses

- License key
- Associated product

Temporary and universal time-based licenses

- License kev
- Associated product
- Expiration date or expiration notice if the license has expired

Slot-based licenses

- License key
- Associated product
- Capacity (number of slots purchased)
- Consumed (number of slots configured to use the license)
- Configured Blade Slot Positions (slot numbers of the configured blade slots)

When no licenses are installed, the message "No license installed on this switch" is displayed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

On the Brocade DCX and DCX 8510 chassis family running Fabric OS v7.0.0 and later, the interchassis link (ICL) license is displayed as an ICL Ports on Demand (POD) license. The fist ICL POD license indicates half of the ICL ports; the second ICL POD license indicates all of the ICL ports. When you upgrade a DCX to Fabric OS v7.0.0, the license display does not change. Refer to the example section for an illustration.

OPERANDS None

EXAMPLES

To display the license keys on a switch with permanent licenses installed:

```
switch:admin> licenseshow
S9bddb9SQbTAceeC:
    Fabric license

SEE ALSO licenseAdd, licenseHelp, licenseIdShow, licenseRemove

licenseSlotCfg

Configures and displays slot-based licensed features.

SYNOPSIS

licenseslotcfg --add feature slot

licenseslotcfg --remove feature slot

licenseslotcfg --show

licenseslotcfg --help

DESCRIPTION

Use this command to configure and manage licenses for the Brocade FX8-24 extension blade on the slot where the blade is installed.

Slot-based licenses allow you to select the slots the license will enable up to the purchased capacity and thereby increase existing capacity without disrupting the slots for which licensed features are already enabled.

There is a separate slot-based license key for each licensed feature supported on the blade. For example, the Brocade FX8-24 supports slot-based license keys for each of the following features:

- 10 GbE license Enables the two 10GbE ports on the Brocade FX8-24.
- Advanced Extension license Enables FCIP Trunking and Adaptive Rate Limiting.
- Advanced FICON Acceleration license Accelerates FICON tape read and write and IBM Global Mirror data replication operations over distance.

A license key with the specified capacity must be installed with the licenseAdd command before you can enable the feature on a specified slot with the licenseSlotCfg command. Refer to the Fabric OS Administrator's Guide for more information.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

feature

Specifies the licensed feature to be added at the specified slot. The feature is specified as a tag from the following set of licenses:

FTR AE

Advanced Extension license

FTR AFA

Advanced FICON Acceleration license

FTR_10G

10 Gigabit Ethernet license

slot

Specifies the slot number for the Brocade FX8-24 extension blade. This number corresponds to the physical blade slot number on the chassis (1-4, 9-12 on the Brocade DCX; 1-2, 7-8 on the Brocade DCX-4S).

--add

Adds a slot-based license to the specified slot.

--remove

Removes a slot-based license from the specified slot. This operation frees up the license to be assigned to another slot. You must disable the applications that use the license on this slot before you can deactivate the license.

```
--show
```

Displays slot assignments for all slot-based licenses in the chassis.

--help

Displays the command usage.

EXAMPLES

To add a license key for the slot-based Advance Extension feature for eight slots:

```
switch:admin> licenseadd \
    DXXtn3LmRSMWCSW3XmfSBPfrWKLZ3HMTN73rP9GANJMA
adding license-key \
    [DXXtn3LmRSMWCSW3XmfSBPfrWKLZ3HMTN73rP9GANJMA]
```

To display the installed license (new license in bold):

```
switch:admin> licenseshow
SSezcSec9RXTf0dj:

linkCost

Sets or displays the Fabric Shortest Path First (FSPF) cost of a link.

SYNOPSIS

linkcost [[slot/]port [cost]]

DESCRIPTION

Use this command to set or display the cost of an interswitch link (ISL). The cost of a link is a dimensionless positive number. The Fabric Shortest Path First (FSPF) protocol compares the cost of various paths between a source switch and a destination switch by adding the costs of all the ISLs along each path. FSPF chooses the path with minimum cost. If multiple paths exist with the same minimum cost, FSPF distributes the load among these paths. The default link cost value is 500 Mbps.

When executed without operands, the command displays the current cost of each port on the switch, including non-ISLs. An E PORT suffix is appended to the interface number of active ISLs. If a static cost is assigned to a port, a STATIC suffix is appended to the link cost. In this case, only the current link cost displays. Use interfaceShow to display both the default and current link costs.

NOTES

This command sets a non-default, "static" cost for any port except EX/VEX ports. Use fcrRouterPortCost to configure EX/VEX ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command cannot be executed on a logical ISL (LISL).

OPERANDS

This command has the following operands

slot

For bladed systems only, specifies the slot number for which to set or display the

cost, followed by a slash (/).

port

Specifies the port number for which to set or display the cost, relative to its slot for

bladed systems. Use switchShow to list of valid ports.

cost

Specifies the static cost of the link connected to the specified port. Recommended cost values are 0 through 32765. Setting static link cost values above 32765 will cause access problems. When you set a link cost value between 32766 and 65534, some parts of the fabric may become inaccessible. When you set the maximum link cost value of 65535, the port will become unusable. In either case, the command displays an appropriate warning message, and you are prompted to continue or to cancel and reissue the command with a lower link cost value. A value of 0 removes the static cost and the port reverts to its default link cost. If cost is not specified, the command displays the current cost of the specified port.

EXAMPLES

To display the link costs for all ports on a switch:

switch:admin> linkcost

	Port	Cost				
1/0	(E_PORT)	500				
1/1		500				
1/2		500				
1/3		500				
1/4		500				
1/5		500				
1/6		500				

```
1/7
                   500
1/8
                   500
1/9 (E_PORT)
                   500
1/10
                   500
1/11
                   500
1/12
                   500
1/13
                   500
1/14
                   500
1/15
                   500
Type <CR> to continue, Q<CR> to stop:
```

To set the ISL cost on a port:

```
switch:admin> linkcost 1/9 1000
```

To display the new cost value on the same port:

```
switch:admin> linkcost 1/9
Interface1/9 (E_PORT) Cost 1000 (STATIC)
```

To delete the cost value and reset to default:

```
switch:admin> linkcost 1/9 0
```

To display the change:

```
switch:admin> linkcost 1/9
Interface1/9 (E_PORT) Cost 500
```

To set the ISL cost to a value outside of the recommended range:

```
switch:admin> linkcost 1/9 32766
The link cost entered may prevent some parts of the fabric
from being accessible. If you do not want this to happen, choose n|no
and run 'linkcost' again with a value lower than 32766.
Do you want to continue? (yes, y, no, n): [no]y
switch:admin> linkcost 1/9
Interface1/9 (E_PORT) Cost 32766 (STATIC)
```

To set the ISL cost to the maximum value:

```
switch:admin> linkcost 1/9 65535 The link cost entered will cause the port to become unusable. If you do not want this to happen, choose n \mid no and run 'linkcost' again with a value lower than 65535. Do you want to continue? (yes, y, no, n): [no] n
```

SEE ALSO interfaceShow, IsDbShow, topologyShow, uRouteShow, fcrRouterPortCost

22 login

login

Logs in as new user.

SYNOPSIS login

DESCRIPTION Use this command to log in to the switch with another user name and password, without first logging out

from the original session. If you originally connected through a Telnet or rlogin session, that session is left

open.

This command allows you to access commands that you cannot access at your current user level.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To log in as admin from the login user:

> switch:user> login login: admin Password: *****

SEE ALSO logout

logout

Logs out from a shell session.

SYNOPSIS logout

DESCRIPTION Use this command to log out from a shell session. Remote login connections are closed and the local

serial connections return to the login prompt.

The **exit** command is accepted as a synonym for **logout**, as is **Ctrl-D** at the beginning of a line.

OPERANDS None

EXAMPLES To log out from an rlogin session:

switch:admin> logout

SEE ALSO login

IsanZoneShow

Displays logical SAN zone information.

SYNOPSIS Isanzoneshow [-s] [-f fabricid| [-w wwn] [-z zonename]

DESCRIPTION

Use this command to display the inter-fabric zones or LSAN zones. These zones are normal WWN zones created in FC Router EX_Port-connected fabrics and backbone fabrics. The LSAN zones are identified by the text string "lsan_" in the zone name. Note that the string is case insensitive so "LSAN_" also is valid. The FC Router uses these zones to establish the inter-fabric device import and export policy. The LSAN zones are established by zoning administration in each EX_Port-attached fabric and backbone fabric. Inter-fabric device sharing is allowed between two devices if the LSAN zones defined in their respective fabrics both allow the two devices to communicate; for example, the intersection of LSAN zones in two fabrics define the device sharing policy.

The LSAN zones are listed by fabric. Zone membership information (information about the devices in the zone) is provided for each LSAN zone. The default output displays only WWNs of the zone members.

Search parameters -f, -w, and -z allow searching for LSAN zones based on fabric ID, WWN of an LSAN zone member, or LSAN zone name.

"No LSAN zone found" is displayed if there is no LSAN zone information available at this FC Router.

Each LSAN zone entry displays the following:

Fabric ID

The ID of the fabric in which the LSAN zone was created.

Zone Name

The zone name.

Zone Members

The zone members or devices. The default output displays the WWN of the zone

members.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-s state

Displays state information for the device. Valid states include the following:

Configured

Device is configured to be in an LSAN, but the device is neither imported nor

exists in this fabric.

Initializing

Device is in an intermediate state. It is not yet imported into the fabric.

EXIST

Device exists in this fabric (the fabric of the zone entry).

Imported

Device has been imported (proxy created) into this fabric.

-f fabricid

Displays LSAN zones in the specified fabric.

-w wwn

Displays LSAN zones containing the specified port WWN. The WWN format is xx:xx:xx:xx:xx:xx:xx:xx.

-z zonename

Displays LSAN zones with the specified zone name. The database for zones is displayed per switch, which can differ from the database stored on the other FCR switches.

EXAMPLES To display the LSAN zones:

SEE ALSO fcrFabricShow, fcrPhyDevShow, fcrProxyDevShow, fcrRouteShow, switchShow

IsCfg

Configures and manages a logical switch

SYNOPSIS

Iscfg --create FID [-b | -base] [-f | -force]

Iscfq --delete FID

lscfg --config FID -slot slot1[-slot2] [-port [port1[-port2]] [-f |-force]

Iscfg --restore to default FID

Iscfg --restore slot to default slot

Iscfg --change FID [[-newfid FID] | [-base]] [-force]

Iscfg --show [-ge] [-provision]

Iscfg --help

DESCRIPTION

Use this command to create a logical switch and to modify logical switch configurations.

The logical switch feature provides the ability to partition a single physical switch into multiple switch instances. Each of these switch partitions is referred to as a logical switch (LS). The logical switch feature allows you to configure multiple logical fabrics on top of a base (physical) fabric. Each logical fabric is made up of logical switches that share the physical resources of the base fabric, for example, interswitch link (ISL) connectivity. At the same time, protocol and management isolation of each logical fabric is maintained, and each logical fabric can scale independently.

The Default Logical Switch is created by the system and cannot be deleted. All switch ports not explicitly assigned to a logical switch are part of the default logical switch.

The Virtual Fabric (VF) feature must be enabled on the switch before you can configure a logical switch. Use the fosconfig --enable vf command to enable the feature. Use the fosconfig --show command to determine whether the VF feature is enabled or disabled on the switch.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details

Not all commands that support the -force option will prompt for user input when used without the -force option.

OPERANDS

This command has the following operands:

--create

Creates a logical switch instance. The following operands are supported.

FID

Specifies the Fabric ID. Each logical switch in a chassis is assigned a unique fabric identifier. The FID address space is shared between logical switches and EX_Ports. Valid FID values are integers between 1 and 128. The default logical switch is assigned FID 128 by default. This operand is required.

-b | -base

Creates a base logical switch on the chassis. A base logical switch communicates among different logical switches. Legacy switches can be connected to the base logical switch through EX_Ports, and interswitch links (ISLs) between base logical switches enable communication among different logical switches. This operand is optional.

-f | -force

Executes the command without confirmation. This operand is optional.

--delete

Deletes a logical switch with the specified fabric ID. The specified logical switch must exist and no ports should be configured on this partition. You must remove all ports from the logical switch before deleting the logical switch instance. Use the **lscfg** --config command to remove the ports.

FID

Specifies the Fabric ID of the logical switch. This operand is required.

--confia

Configures the specified logical switch. This command assigns ports to the logical switch specified by a given FID. The ports are removed from the partition on which they are currently configured. This command prompts for confirmation, indicating that the specified ports will be disabled. The following operands are supported:

FID

Specifies the fabric ID of the logical switch. This operand is required.

-slot slot1[-slot2]

Specifies the slot number or a range of slot numbers separated by a dash, for example **-slot 3-5**. This operand is required.

-port port1[-port2]

Specifies the ports to be assigned to the logical switch. Provide a valid port, or a range of ports separated by a dash, for example **-port 3-8**. This operand is optional; if omitted, all ports on the specified slots are assigned.

-f | -force

Executes the command without confirmation. This operand is optional.

--restore_to_default FID

Moves all vacant ports in the logical switch specified by **FID** to the default switch. Use this command when **IsCfg --show** displays no ports, but the switch continues to generate errors indicating that there are ports on the switch.

--restore_slot_to_default slot

Moves all ports on a specified slot to the default switch.

--change

Changes the fabric ID of a logical switch, creates a base logical switch out of an existing logical switch, or removes base switch properties. The **-newfid** and **-base** operands are exclusive and may not be combined. The following operands are supported:

FID

Specifies the Fabric ID of the logical switch. This operand is required.

-n | -newfid FID

Changes the fabric ID of an existing logical switch. This command effectively removes the logical switch from a given logical fabric and makes it part of another logical fabric.

-b | -base

Turns an existing logical switch into a base switch. When this command is issued on a switch that is already a base switch, this command removes the base switch properties. This command disables the current logical switch. After making the change, you must re-enable the switch.

-f | -force

Executes the command without confirmation. This operand is optional.

--show

Displays the partition configuration on a switch or chassis. Without any operands, the command displays all logical switches and the FC ports assigned to them. For each switch, the FID and switch role are displayed: base switch (BS) or default switch (DS). The following operands are optional with the **--show** option.

-ge

Displays partition configuration information for GbE ports. This operand is valid only on the Brocade 7800/FX8-24 and the Brocade FR4-18i platforms.

-provision

Displays the partition configuration for all slots, regardless of the slot's status. This operand is valid only on a chassis and can be used with or without the -qe option.

--help

Displays the command usage.

EXAMPLES To create a base switch:

```
switch:admin> lscfg --create 1 -base
Creation of a base switch requires that the proposed
  new base switch on this system be disabled.
Would you like to continue [y/n]?: y
About to create switch with fid=1. Please wait...
```

Switch successfully created.

Logical Switch has been created with default configurations. Please configure the Logical Switch with appropriate switch and protocol settings before activating the Logical Switch.

To create a logical switch identified by fabric ID 2:

```
switch:admin> lscfg --create 2
About to create switch with fid=2. Please wait...
Switch successfully created.
```

Logical Switch has been created with default configurations. Please configure the Logical Switch with appropriate switch and protocol settings before activating the Logical Switch.

To create a base switch with FID 2 without confirmation:

```
switch:admin> lscfg --create 2 -base -force
About to create switch with fid=2. Please wait...
Switch successfully created.
```

Logical Switch has been created with default configurations. Please configure the Logical Switch with appropriate switch and protocol settings before activating the Logical Switch.

To delete a logical switch:

```
switch:admin> lscfg --delete 2
All active login sessions for FID 2 have been terminated.
Switch successfully deleted.
```

To assign ports to a logical switch:

```
switch:admin> lscfg --config 2 -port 10-12 This operation requires that the affected ports be disabled. Would you like to continue [y/n]: y Making this configuration change. Please wait... Configuration change successful. Please enable your ports/switch when you are ready to continue.
```

To assign ports to a logical switch without confirmation:

```
switch:admin> lscfg --config 2 -port 0-4 -force
Configuration change successful.
Making this configuration change. Please wait...
Please enable your ports/switch when you are ready to continue.
```

To display the logical switch configuration for :FC ports only:

switch:admin> lscfg --show

	itches: 12 1 2	. , ,	,	6	7	8 9
FID 1	1 1	1	1 1	1	1	2 2
Port 10	11 12	13 1	.4 15	16	17	18 19
FID 128	128 128	128 12	8 128	128	128 1	128 128
Port 20	21 22	23 2	4 25	26	27	28 29
FID 128	128 128	128 12	8 128	128	128 1	128 128
Port 30	31 32	33 3	4 35	36	37	38 39
FID 128	128 128	2	2 2	128	128 1	128 128

To display the logical switch configuration for GbE ports only (in the example, all GbE ports are in logical switch 2):

switch:admin> lscfg --show -ge

Created switches: (ds) 2(bs) 1

7		2				
8		2				
9		2				
10		2				
11		2	1			

To display the partition configuration for all slots with the **-ge** option:

switch:admin> lscfg --show -provision -ge

Created Slot	ed switches:		128(ds) 2(bs) 1 3 4 5			6	7	8	
Port									
0	128	2					128	128	
1	128	2					128	128	
2	128	2					128	128	
3	128	2					128	128	
4	128	2					128	128	
5	128	2					128	128	
6	128	2	i i	ĺ	ĺ	ĺ	128	128	
7	128	2					128	128	
8	128	2					128	128	
9	128	2	i i	ĺ	ĺ	ĺ	128	128	
10	128	2	l İ	ĺ	ĺ	ĺ	128	128	
11	128	2		j	į	j	128	128	

To change the fabric ID for a logical switch:

switch:admin> lscfg --change 1 -newfid 2 Changing of a switch fid requires that the switch be disabled. Would you like to continue [y/n]?: yDisabling switch... All active login sessions for FID 2 have been terminated. Checking and logging message: fid = 2. Please enable your switch.

To display the change:

switch:admin> lscfg --show

Created switches: 128(ds) 1 2(bs)

					_		(,				- /									
Port	0		1		2		3		4		5		6		7		8		9	
FID	1		1		1		1		1		128		128		128		128		128	
Port	10		11		12		13		14		15		16		17		18		19	
FID	128		128		128		128		128		128		128		128		128		128	
Port	20		21		22		23		24		25		26		27		28		29	
FID	128		128		128		128		128		128		128		128		128		128	
Port	30		31		32		33		34		35		36		37		38		39	
FID	128	1	128	1	128	I	128	I	128	Ī	128	Ī	128	Ī	128	ı	128	ı	128	Ī

To make logical switch FID 1 the base switch without confirmation:

```
switch:admin> lscfg --change 1 -base -force Disabling the current base switch...
Disabling switch fid 1
Disabling the proposed new base switch...
Disabling switch fid 1
Please enable your switches when ready.
```

To make logical switch FID 1 the base switch with confirmation:

```
switch:admin> lscfg --change 1 -base
Creation of a base switch requires that the proposed new base switch on this
system be disabled.

Would you like to continue [y/n]?: y
Disabling the proposed new base switch...
Disabling switch fid 1
Please enable your switches when ready.
```

SEE ALSO IfCfg, setContext

IsDbShow

Displays the Fabric Shortest Path First (FSPF) link state database.

SYNOPSIS Isdbshow [domain]

DESCRIPTION

Use this command to display an FSPF link state database record for switches in the fabric or for a specified domain.

There are two types of database entries:

- The link state database entry, which is permanently allocated.
- The link state record (LSR), which is allocated when a switch is connected to the fabric.

The LSR describes the links between connected domains in a fabric. For a link to be reported in the LSR, the neighbor for that link must be in NB_ST_FULL state.

This command displays the content of both types of database entries, if both are present, as shown below:

Domain

Domain ID described by this LSR. A (self) keyword after the domain ID indicates

that LSR describes the local switch.

IsrP

Pointer to LSR.

earlyAccLSRs

Number of LSRs accepted, even though they were not sufficiently spaced apart.

ignored LSRs

Number of LSRs not accepted because they were not sufficiently spaced apart.

lastIgnored

Last time an LSR was ignored.

installTime

Time this LSR was installed in the database, in seconds since boot.

IseFlags

Internal variable.

uOutlfs

Internal variable.

uPathCost

Internal variable.

uOldHopCount

Internal variable.

uHopsFromRoot

Internal variable.

mOutIfs

Internal variable.

parent

Internal variable.

mPathCost

Internal variable.

mHopsFromRoot

Internal variable.

IsAge

Age, in seconds, of this LSR. An LSR is removed from the database when its age

exceeds 3,600 seconds.

reserved

Reserved for future use.

type

Type of the LSR. Always 1.

options

Always 0.

IsId

ID of this LSR. It is identical to the domain ID.

advertiser

Domain ID of the switch that originated this LSR.

incarn

Incarnation number of this LSR.

length

Total length, in bytes, of this LSR. Includes header and link state information for all

links.

chksum

Checksum of total LSR, with exception of IsAge field.

linkCnt

Number of links in this LSR. Each link represents a neighbor in NB_ST_FULL

state.

flags

Always 0.

Linkld

ID of this link. It is the domain ID of the switch on the other side of the link.

out port

Port number on the local switch.

rem port

Port number of the port on the other side of the link.

cost

Cost of this link. The default cost for a 1 Gbps link is 1,000.

costCnt

Always 0.

type

Always 1.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

domain

Specifies the domain ID of the LSR to be displayed. This operand is optional; if omitted, the entire link state database is displayed.

EXAMPLES To display the link state record for a switch:

```
switch:admin> lsdbshow 1
Domain = 1 (self), Link State Database Entry pointer = 0x1096da60
lsrP
               = 0 \times 109784b0
earlyAccLSRs = 0
              = 0

SEE ALSO interfaceShow, nbrStateShow

memShow

Displays the amounts of free and used memory in a switch.

SYNOPSIS memshow [-b | -k | -m]

DESCRIPTION Use this command to display free and used memory in the switch, as well as the shared memory and

buffers used by the kernel.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

-b

Specify to display memory usage in bytes.

-k

Specify to display memory usage in kilobytes.

-m

Specify to display memory usage in megabytes. By default, memory usage is

displayed in bytes.

EXAMPLES To view the memory usage:

switch:admin> memshow

total used free shared buffers cached Mem: 129740800 112562176 17178624 0 139264 30396416 Swap: 0 0 0

motd

Sets the banner on the chassis.

SYNOPSIS motd --set string

motd --show

DESCRIPTION Use this command to set the banner on the chassis.

The banner is a string of alphanumeric characters. It is displayed before you log in to a switch.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following optional operands:

--set string

Specify a text string of alphanumeric characters to be displayed before login. The

string must be enclosed in double quotation marks. Spaces are allowed. The

maximum length is 116 characters.

--show

Displays the chassis-wide banner.

--help

Displays the command usage.

EXAMPLES To set a chassis-level banner for the switch:

```
switch:admin> motd --set "This is a \
     chassis-level banner. It displays before the login."
```

To display the banner:

```
switch:admin> motd --show
This is a chassis-level banner. It displays before the login.
```

SEE ALSO bannerSet, bannerShow

msCapabilityShow

Displays the Management Server (MS) capabilities.

SYNOPSIS mscapabilityshow

DESCRIPTION

Use this command to display the supported capabilities of the Management Server for each switch in the fabric. An asterisk displays next to the name of the local switch.

NOTES

Reliable commit service (RCS) is a fabric-wide capability and is supported only if all the switches in the fabric support the service.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details

OPERANDS None

EXAMPLES

To display the supported MS capabilities for each switch in the fabric:

```
switch:admin> mscapabilityshow
Switch WWN Canal
```

Switch WWN	Capability	Switch Name
=======================================	=======	======
10:00:00:60:69:20:15:71	0x0000008f	"switch1"*
10:00:00:60:69:00:30:05	0x0000008f	"switch2"

Capability Bit Definitions:

Bit 0: Basic Config Service Supported.

Bit 1: Platform Management Service Supported.

Bit 2: Topology Discovery Service Supported.

Bit 3: Unzoned Name Service Supported.

Bit 4: Fabric Zone Service Supported.

Bit 5: Fabric Lock Service Supported.

Bit 6: Time Service Supported.

Bit 7: RSCN Small Payload Supported.

Bit 8: Reliable Commit Service(RCS) Supported.

Bit 9: Access Gateway Registration/Discovery Supported.

Bit 10: Administrative Domains(AD) Supported.

Others: Reserved.

msConfigure

Configures the Management Server (MS) access control list (ACL).

SYNOPSIS msconfigure

DESCRIPTION

Use this command to configure the MS Access Control List (ACL). The MS allows a Storage Area Network (SAN) management application to retrieve and administer the fabric and Interconnect Elements, such as switches. This application is located at the Fibre Channel well-known address, 0xFFFFFA.

If the MS ACL is empty (default), The MS is available to all systems connected to the fabric. By populating the MS ACL with one or more world wide names (WWNs), you can restrict access to MS to the specified WWNs.

This command is interactive and provides the following choices:

0 Done 1

Display the access list

2

Add member based on its port/node WWN

3

Delete member based on its port/node WWN

When changing the MS ACL by adding or deleting WWNs, you are prompted to save the new configuration to nonvolatile storage. The saved MS ACL becomes effective upon reboot.

The MS ACL is implemented on a per-switch basis and should be configured on the switch to which the management application is directly connected.

NOTES

When an FCS policy is enabled, the MS ACL is not used. In such a case, access to MS is controlled by security by way of the MS POLICY configuration.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only in AD0 and AD255 contexts.

OPERANDS None

EXAMPLES

To display the MS ACL:

```
switch:admin> msconfigure
```

```
Done
1
       Display the access list
       Add member based on its Port/Node WWN
       Delete member based on its Port/Node WWN
select : (0..3) [1] 1
MS Access List consists of (5): {
20:01:00:60:69:00:60:10
20:02:00:60:69:00:60:10
20:03:00:60:69:00:60:10
20:02:00:60:69:00:60:03
```

```
20:02:00:60:69:00:60:15

0 Done
1 Display the access list
2 Add member based on its Port/Node WWN
3 Delete member based on its Port/Node WWN
select: (0..3) [1] 0

done ...
```

msPlatShow

Displays the Management Server (MS) platform database.

SYNOPSIS

msplatshow

DESCRIPTION

Use this command to display information from the MS platform database. This command displays the name of each platform object with the platform type (GATEWAY, HOST_BUS_ADAPTER, and so forth), associated management addresses, and associated node names.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

None

EXAMPLES

To display the MS platform database for a fabric:

```
switch:admin> msplatshow
_____
Platform Name: [9] "first obj"
Platform Type: 5 : GATEWAY
Number of Associated M.A.: 1
Associated Management Addresses:
[35] "http://java.sun.com/products/plugin"
Number of Associated Node Names: 1
Associated Node Names:
10:00:00:60:69:20:15:71
______
Platform Name: [10] "second obj"
Platform Type: 7 : HOST_BUS_ADAPTER
Number of Associated M.A.: 1
Associated Management Addresses:
[30] "http://java.sun.com/products/1"
Number of Associated Node Names: 2
Associated Node Names:
10:00:00:60:69:20:15:79
10:00:00:60:69:20:15:75
```

 $ms Capability Show, \, ms Configure, \, ms Plat Show, \, ms PlClear DB, \, ms PlMgmt Activate, \, ms PlMgmt Deactivate$

msPlClearDB

Clears the Management Server (MS) platform database on all switches in the fabric.

SYNOPSIS msplcleardb

DESCRIPTION

Use this command to clear the MS platform database in the entire fabric. Because this operation cannot be undone, it should not be performed unless it is intended to resolve a database conflict between two joining fabrics or to establish an entirely new fabric with an empty database.

NOTES

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only in AD0 and AD255 contexts.

OPERANDS None

EXAMPLES

To clear the MS platform database:

```
switch:admin> msplcleardb
MS Platform Service is currently enabled.
This will erase MS Platform Service Database in the\
   entire fabric.
Would you like to continue this operation?
   (yes, y, no, n): [no] y
Request to MS Platform DB Clear operation in progress...
*Completed clearing MS Platform Service Database!!
```

SEE ALSO

msCapabilityShow, msConfigure, msPlatShow, msPlatShowDBCB, msPlMgmtActivate, msPIMgmtDeactivate

msPIMgmtActivate

Activates the Management Server (MS) platform service.

SYNOPSIS msplmgmtactivate

DESCRIPTION

Use this command to activate the MS platform service throughout the fabric. This command attempts to activate the MS platform service for each switch in the fabric. The change takes effect immediately and is committed to the configuration database of each affected switch. MS activation is persistent across power cycles and reboots.

NOTES

By default, the MS platform service is disabled.

Before issuing this command, run **msCapabilityShow** to verify that all switches in the fabric support the MS platform service; if one switch does not support the service, the command fails.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only in AD0 and AD255 contexts.

OPERANDS None

EXAMPLES To activate the MS platform service:

switch:admin> msplmgmtactivate

Request to activate MS Platform Service in progress.....

*Completed activating MS Platform Service in the fabric!

SEE ALSO

msCapabilityShow, msPlatShow, msPlClearDB, msPlMgmtDeactivate

msPIMgmtDeactivate

Deactivates the Management Server (MS) platform service.

SYNOPSIS msplmgmtdeactivate

DESCRIPTION Use this command to deactivate the MS platform service throughout the fabric. This command

deactivates the MS platform service for each switch in the fabric and commits the change to nonvolatile

storage.

NOTES When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

This command is supported only in AD0 and AD255 contexts.

OPERANDS None

EXAMPLES To deactivate the MS platform service on all switches in the fabric:

switch:admin> msplmgmtdeactivate

MS Platform Service is currently enabled.

This will erase MS Platform Service configuration information as well as database in the entire fabric.

Would you like to continue this operation? (yes, y, no, n): [no] \mathbf{y}

Request to deactivate MS Platform Service in progress...

*Completed deactivating MS Platform Service in the fabric!

SEE ALSO

msCapabilityShow, msConfigure, msPlatShow, msPlatShowDBCB, msPlClearDB, msPlMgmtActivate

msTdDisable

Disables the Management Server (MS) topology discovery service.

SYNOPSIS m

mstddisable ["ALL"]

DESCRIPTION

Use this command to disable the management server topology discovery service on a local switch or an entire fabric. This change takes effect immediately and commits to the configuration database for all affected switches. The change is persistent across power cycles and reboots.

NOTES

Topology Discovery Management requires the attached devices (including attached switches) to support request node identification data (RNID) extended link service (ELS).

When an FCS policy is enabled, and this command is issued with the "ALL" operand, it can be issued only from the primary FCS.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only in AD0 and AD255 contexts.

OPERANDS

The following operand is optional:

"ALL"

Disables the MS topology discovery service throughout the entire fabric. This operand must be enclosed in double quotation marks.

EXAMPLES

To disable the MS topology discovery service on the local switch only:

```
switch:admin> mstddisable
This may erase all NID entries. Are you sure?
    (yes, y, no, n): [no] y
Request to disable MS Topology Discovery Service in progress....
done.
*MS Topology Discovery disabled locally.
```

To disable MS topology discovery on all the switches in the fabric:

```
primaryfcs:admin> mstddisable "ALL"
This may erase all NID entries. Are you sure?
    (yes, y, no, n): [no] y

Request to disable MS Topology Discovery Service
    in progress....
done.
*MS Topology Discovery disabled locally.
*MS Topology Discovery Disable Operation Complete!!
```

SEE ALSO msTdEnable, msTdReadConfig

msTdEnable

Enables the Management Server (MS) topology discovery service.

SYNOPSIS mstdenable ["ALL"]

DESCRIPTION

Use this command to enable the MS topology discovery service on the local switch or throughout the fabric. The change takes effect immediately and commits to the configuration database for all affected switches. The change is persistent across power cycles and reboots.

NOTES

Topology Discovery Management requires the attached devices (including attached switches) to support request node identification data (RNID) extended link service (ELS).

When an FCS policy is enabled, and this command is issued with the "ALL" operand, it can be issued only from the primary FCS.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only in AD0 and AD255 contexts.

OPERANDS

The following operand is optional:

"ALL"

Enables the MS topology discovery service throughout the fabric. This operand must be enclosed in double quotation marks.

EXAMPLES

To enable the MS topology discovery service on the local switch:

```
switch:admin> mstdenable
Request to enable MS Topology Discovery Service
 in progress....
done.
*MS Topology Discovery enabled locally.
```

To enable MS topology discovery on all switches in the fabric:

```
switch:admin> mstdenable "ALL"
Request to enable MS Topology Discovery Service
 in progress....
done.
*MS Topology Discovery enabled locally.
*MS Topology Discovery Enable Operation Complete!!
```

SEE ALSO msTdDisable_msTdReadConfig

msTdReadConfig

Displays the status of The Management Server (MS) topology discovery service.

SYNOPSIS mstdreadconfig

DESCRIPTION Use this command to check whether or not the management server topology discovery service is

enabled.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the status of the topology discovery service:

switch:admin> mstdreadconfig

*MS Topology Discovery is enabled.

SEE ALSO msCapabilityShow, msConfigure, msPIMgmtActivate, msPIMgmtDeactivate, msTdDisable,

msTdEnable

myld

Displays the current login session details.

SYNOPSIS

myid

DESCRIPTION

Use this command to display the status of the system and the login session details. This includes IPv4 or IPv6 addresses associated with the login session.

The login session gives details of the following:

- CP/switch (or console/serial port) used to log in.
- The IP address of the current login session for Telnet or the name of the current console port or the serial port (if modem login used).
- The current CP mode (Active, Standby, or Unknown).
- The current system status (Redundant, Nonredundant, or Unknown).

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display current login information:

switch:admin> myid Current Switch: switch

Session Detail: switch (123.123.123.123) Active Redundant

SEE ALSO version

nbrStateShow

Displays the state of FSPF neighbors.

SYNOPSIS nbrstateshow [s/ot/][port]

DESCRIPTION

Use this command to display information about fabric shortest path first (FSPF) neighbors to the local switch or information about a neighbor to a specified port. FSPF defines a neighbor as a remote E_Port interface that is directly attached to the local switch. However, if ports are trunked, the command displays data only about the trunk master.

This command displays the following fields:

Local Domain ID

Domain ID of the local switch.

Local Port

 $\ensuremath{\mathsf{E}}\xspace_{-}\ensuremath{\mathsf{Port}}$ interface on the local switch. This value is typically equal to the Index field

reported in the switchShow command.

Domain

Domain ID of the remote switch.

Remote Port

E_Port interface on the remote switch.

State

State of the neighbor. The neighbor can be in one of the following five states:

0

NB_ST_DOWN - The neighbor is down.

1

NB_ST_INIT - The neighbor is initializing.

2

NB_ST_DB_EX - The neighbor and the switch are exchanging data from their

Link State Records (LSR) databases.

3

NB_ST_DB_ACK_WT -The neighbor is waiting for the switch to acknowledge the

LSR database.

4

NB_ST_DB_WT - The LSR Database is in waiting state; synchronization is in

process.

5

NB_ST_FULL - The neighbor is in the last, finishing state. The E_Port can route

frames only if the neighbor is in full state.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to display, followed by a slash (/).

port

Specify the port number to display, relative to its slot for bladed systems. Use **switchShow** to list valid ports. This operand is optional; if omitted, all neighbor states are displayed.

EXAMPLES

To display information about a neighbor directly connected to the local switch:

switch:user> nbrstateshow 2/0
Local Domain ID: 1

Local Port	Domain	Remote Port	State
16	2	48	NB_ST_FULL

SEE ALSO interfaceShow

nbrStatsClear

Resets FSPF interface counters.

SYNOPSIS nbrstatsclear [slot/][port]

DESCRIPTION Use

Use this command to reset the counters of fabric shortest path first (FSPF) frames transmitted and received on all interswitch links (ISLs) or on a specified ISL Use this command without operands to reset counters on all interfaces. Use **interfaceShow** to view the FSPF counters.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to display, followed by a slash (/).

port

Specify the port number to display, relative to its slot for bladed systems. Use **switchShow** to list valid ports. This operand is optional; if omitted, FSPF statistics are reset.

EXAMPLES

To display the counters on a port:

```
switch:admin> interfaceshow 1/0
idbP
                = 0x10050a38
Interface 0 data structure:
nghbP
                = 0x1004ce68
ifNo
                = 0
               = 0 (self)
masterPort
defaultCost
                = 500
                = 500
cost
delay
                = 1
(output truncated)
nCmdAcc
                = 37
nInvCmd
                = 0
nHloIn
                = 10
```

nInvHlo = 0 nLsuIn = 17 nLsaIn = 10 attHloOut = 11 nHloOut = 11 attLsuOut = 12 nLsuOut = 12 attLsaOut = 17 nLsa0ut

To reset the counters on a port:

switch:admin> nbrstatsclear 1/0

To verify the changes:

```
switch:admin> interfaceshow 1/0
idbP
                     = 0x10050a38
Interface 0 data structure:
nghbP = 0x1004ce68
ifNo = 0
masterPort = 0 (self)
defaultCost = 500
                   = 500
(output truncated)
```

SEE ALSO interfaceShow, portShow, switchShow

nodeFind

Displays all device Name Server (NS) entries matching a given WWN, device PID, or alias.

SYNOPSIS

nodefind WWN | PID | ALIAS

DESCRIPTION

Use this command to display the NS information for all devices in the fabric that have either a port world wide name (WWN) or a node WWN matching the given WWN; or have a device PID matching the given PID; or have a defined configuration alias to which the device belongs matching the given alias.

If there is no device matching the given WWN, PID, or alias, the message "No device found" is displayed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

WWN | PID | ALIAS

Specify the WWN, device PID, or alias that can be used to match the real device's data. The WWN must have eight colon-separated fields, each consisting of one or two hexadecimal numbers between 0 and ff, with no spaces. The PID must begin with 0x or 0X; otherwise, it is interpreted as an alias.

EXAMPLES

To display all the device information matching the WWN "20:00:00:e0:8b:01:ce:d3":

To display all the device information matching the PID "0x020eef":

To display device information for a string for which there is no match:

```
switch:user> nodefind abcd
No device found.
```

To display all the device information matching the alias "a320":

```
switch:user> nodefind a320

SEE ALSO aliShow, nsAllShow, nsCamShow, nsShow

nsAliasShow

Displays local Name Server (NS) information, with aliases.

SYNOPSIS

nsaliasshow [-r][-t]

DESCRIPTION

Use this command to display local name server information with the added feature of displaying the defined configuration aliases to which the device belongs. If there are no defined configuration aliases for that device, no alias is displayed. If there is no information in this switch, the following message is displayed: "There is no entry in the Local Name Server."

The information displayed for each device is the same that is displayed by the **nsShow** command with the exception of the additional display of the alias to which the device belongs. Refer to the **nsShow** help page for a description of these displays. Use **nsCamShow** to display information from all switches.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following optional operands:

-r

Replaces the time-to-live (TTL) attribute output with state change registration (SCR) information. This value indicates what type of RSCN a device registers to receive. Values include the following:

SCR=0

Reserved.

SCR=1

Fabric detected registration. Register to receive all RSCN requests issued by the fabric controller for events detected by the fabric.

SCR=2

NX_Port detected registration. Register to receive all RSCN requests issued for events detected by the affected NX_Port.

SCR=3

Register to receive all RSCN requests issued. The RSCN request returns all effected N_Port_ID pages.

-t

Displays the device type. The device type is defined in terms of two attributes. The first attribute indicates the origination of the device as one of the following:

- Physical -The device is connected to the NX_Port, using FLOGI to log in to the switch.
- Virtual -The device is contrived by the switch.
- NPV -The device is connected to the NX_Port, using FDISC to log in to the switch.
- iSCSI Device is connected to the iSCSI port.

The second attribute indicates the role of the device. Valid role attributes include the following:

- Unknown (initiator/target) Device role is not detected
- Initiator An iSCSI initiator.
- Target An iSCSI target.
- Initiator+Target Both an iSCSI initiator and an iSCSI target.

EXAMPLES To display local NS information with aliases:

```
switch:user> nsaliasshow
    Type Pid
                COS PortName
                                     NodeName
                                                           TTL(sec)

SEE ALSO nsAllShow, nsShow, switchShow

nsAllShow

Displays global name server information.

SYNOPSIS

nsallshow [type]

DESCRIPTION

Use this command to display the 24-bit Fibre Channel addresses of all devices in all switches in the fabric. When used with the type operand, the command displays only devices of the specified FC-4 type. FC-4 type codes are referenced in the *Fibre Channel Framing and Signaling* (FC-FS) standards documentation (see "TYPE codes - FC-4"). When used without operand, all devices are displayed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

type

Specifies the FC-4 type code to filter the command output. Valid values are 0 to 255. Only the following two FC-4 device type codes are applicable to the Brocade environment:

- 8 FCP type device
- 5 FC-IP type device

For all other codes, entries are summarized in the format "x ports supporting FC4 *type*", where x is the number of ports and *type* is the user-specified FC-4 type code in hexadecimal format.

EXAMPLES

To display all devices in the fabric, followed by all type 8 (SCSI-FCP) devices, and all type 5 (SCSI-FCIP) devices:

```
switch:admin> nsAllShow
{
    011000 011200 0118e2 0118e4 0118e8 0118ef 021200 021300
    0214e2 0214e4 0214e8 0214ef
12 Nx_Ports in the Fabric }

switch:admin> nsAllShow 8
{
    0118e2 0118e4 0118e8 0118ef 0214e2 0214e4 0214e8 0214ef
8 FCP Ports }

switch:admin> nsAllShow 5
{
    011200 021200
2 FC-IP Ports }
```

To display a device type of 255:

```
switch:admin> nsAllShow 255
{
010100 020a00
2 Ports supporting FC4 0xff }
```

SEE ALSO

nsShow, switchShow

nsCamShow

Displays information about remote devices in the Name Server (NS) cache.

SYNOPSIS

nscamshow [-t]

DESCRIPTION

Use this command to display the local NS cache information about the devices discovered in the fabric by the NS cache manager.

If the NS cache manager does not discover new switches or new devices in the fabric, the command displays the message "No Entry is found!"

For each discovered remote switch, this command displays the following information:

Switch entry for N

Displays the remote domain ID for the switch.

state

Displays one of the following values:

known

The local domain is aware of all the devices from this remote domain.

unknown

The local domain is unaware of devices from this remote domain.

ERROR

The information for this remote domain is unreliable.

rev

Fabric OS firmware version of the remote switch. For switches running firmware

other than Fabric OS, a string of question marks ("????") is displayed.

owner

Displays the owner of the NSCAM database entry. The value displayed is a domain ID (domain address). For example, 0xfffc02 indicates domain 2 and is the domain on which the command has been executed. This is the local domain and the information is stored locally by this switch.

cap_available

Each switch in the fabric exchanges information regarding its capabilities (for example, firmware level, feature support, etc.). When the **cap_available** value is 1, it indicates that the local domain has received the capabilities of the remote domain that is being displayed. When the value is 0 capability information has not been received.

The remaining information displayed for each device is the same that is displayed by the **nsShow** command. Refer to the **nsShow** help page for a description of these displays.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operand is optional:

-t

Displays the device type. The device type is defined in terms of two attributes. The first attribute indicates the origination of the device as one of the following:

Physical

The device is connected to the NX_Port, using FLOGI to log in to the switch.

Virtual

The device is contrived by the switch.

NPV

The device is connected to the NX_Port, using FDISC to log in to the switch.

iSCSI

Device is connected to the iSCSI port.

iSCSI

The second attribute indicates the role of the device. Valid role attributes include

the following:

Unknown (initiator/target)

Device role is not detected

Initiator

An iSCSI initiator.

Target

An iSCSI target.

Initiator+Target

Both an iSCSI initiator and an iSCSI target.

EXAMPLES To display all switch and device entries discovered by the Name Server in the fabric:

```
switch:user> nscamshow
nscam show for remote switches:
Switch entry for 92
state rev
              owner cap_available

SEE ALSO nsAllShow, nsAliasShow, nsShow, switchShow

nsShow

Displays local Name Server (NS) information.

SYNOPSIS nsshow [-r][-t]

DESCRIPTION

Use this command to display local NS information about devices connected to a switch. If no information is available for the switch, the command displays the following message: "There is no entry in the Local Name Server."

Use **nsAllShow** to display NS information for all switches in the fabric.

Each line of output displays the following information:

Type

Displays U for unknown, N for N_Port, NL for NL_Port.

PID

Displays the 24-bit Fibre Channel address of the device.

cos

Displays the Class of Service levels supported by the device. This can be class 1, class 2, or class 3. The command displays only the numeric values, 1, 2, and/or 3.

A device can support multiple CoS levels.

PortName

Displays the device port world wide name (WWN).

NodeName

Displays the device node WWN.

TTL

Displays the time-to-live, in seconds, for cached entries or NA (not applicable) if

the entry is local.

SCR

Displays the state change registration of the device. This field displays only with

the -r option.

Device type

Displays the device type if -t is specified.

Fabric Port Name

Displays the F_Port WWN to which the N_Port connects.

Permanent Port Name

Displays the physical N_Port or NL_Port WWN.

Port Index

Displays the index number of the physical N_Port to which the device connects.

Share Area

Displays "Yes" if the port shares an area; otherwise displays "No".

Device Shared in Other AD

Displays "Yes" if the device is shared in another Admin Domain; otherwise

displays "No."

Redirect

Displays "Yes" if the device is involved in frame redirection; otherwise displays "No". The device involved in frame redirection is specified as either "virtual",

"host", or "target".

Partial

Displays "Yes" if t the device entry is incomplete; otherwise displays "No." Devices that are incomplete are displayed by the **nsShow** and **nsCamShow** commands, and have routing established, but are not considered during device discovery (for example, during FC-GS Name Server Queries).

The following information is displayed only if the device has registered the information (for example, the switch automatically registers SCSI inquiry data for FCP target devices):

- FC4s supported
- IP address
- Port and node symbolic names
- Fabric Port Name. This is the WWN of the port on the switch to which the device is physically connected.
- Port address or port IP address

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following optional operands:

-r

Replaces the time-to-live (TTL) attribute output with state change registration (SCR) information. This value indicates what type of RSCN a device registers to receive. Values include the following:

SCR=0x00000000

Reserved.

SCR=0x00000001

Fabric detected registration. Register to receive all RSCN requests issued by the fabric controller for events detected by the fabric.

SCR=0x00000002

NX_Port detected registration. Register to receive all RSCN requests issued for events detected by the affected NX_Port.

SCR=0x00000003

Register to receive all RSCN requests issued. The RSCN request returns all effected N_Port_ID pages.

The following SCR values use the 4th byte of the SCR value and can coexist with the SCR values of 0x00000000, 0x00000001, 0x00000002, and 0x00000003.

SCR=0x01000000

Principal switch RSCN registration. Register to receive proprietary RSCN (principal switch change).

SCR=0x02000000

AG_QOS RSCN registration.

-t

Displays the device type. The device type is defined in terms of two attributes. The first attribute indicates the origination of the device as one of the following:

Physical

The device is connected to the NX Port, using FLOGI to log in to the switch.

Virtual

The device is contrived by the switch.

NPV

The device is connected to the NX_Port, using FDISC to log in to the switch.

iSCSI

The device is connected to the iSCSI port.

The second attribute indicates the role of the device. Valid role attributes include

the following:

Unknown (initiator/target)

Device role is not detected

Initiator

An iSCSI initiator.

Target

An iSCSI target.

Initiator+Target

Both an iSCSI initiator and an iSCSI target.

EXAMPLES To display local NS information:

```

nszonemember -a | -u

DESCRIPTION

Use this command to display information on all online devices zoned with the specified device. The device can be specified by WWN or Port ID (PID). Use this command with the -u option to display all unzoned devices in the entire fabric. Use the -a option to display online zoned device data for each local device.

The command output displays the following information:

Type

U - known, N - N_Port, NL - NL_Port.

Pid

The 24-bit Fibre Channel address.

cos

A list of classes of service supported by the device.

PortName

The device's port world wide name (WWN).

NodeName

The device's node WWN.

Permanent Port Name

The physical N_Port or NL_Port WWN.

DeviceType

The device type.

Port Index

The index of the port to which the device is attached.

Shared Area

Whether or not the device shares an area with other devices.

Device Shared in Other AD

Whether or not the device is shared in other Admin Domains.

Additional lines may display if the device has registered any of the following information (the switch automatically registers SCSI inquiry data for FCP target devices):

- FC4 supported
- IP address (node)
- port and node symbolic name (local device only)
- fabric port name
- hard address or port IP address

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

PID | WWN

Specifies the port ID or WWN of the device for which to display zoned devices.

-a

Displays each local device's online zoned device data, including the device PID

and zone alias.

-u

Displays all unzoned devices in the entire fabric. The device data includes the device PID and zone alias.

EXAMPLES

To display information about all the online devices zoned with the given device:

```
switch:admin> nszonemember 0x0416e2
3 local zoned members:
Type Pid COS
                Port.Name
                                        NodeName
                                                                  SCR
NL 041901;2,3;10:00:00:00:c9:26:0e:ae;20:00:00:c0:c9:26:0e:ae; 3
    Fabric Port Name: 20:09:00:60:69:50:06:78
    Permanent Port Name: 10:00:00:00:c9:26:0e:ae
    Device type: Physical Initiator
NL 0416e2;3;22:00:00:20:37:d9:6b:b3;20:00:00:20:37:d9:6b:b3; 0
    FC4s: FCP [SEAGATE ST318304FC
                                       0005]
    Fabric Port Name: 20:06:00:60:69:50:06:78
    Permanent Port Name: 22:00:00:20:37:d9:6b:b3
    Device type: Physical Target

passwd

Changes the password for a specified user.

SYNOPSIS

passwd

[user_account]
[-old old_password]
[-new new_password]

DESCRIPTION

Use this command to change a user account password.

Passwords can be changed locally on any switch. For the password database to be distributed to other switches in the fabric, the switches must be configured to accept the password database with the **fddCfg** command. The password database is distributed manually with the **distribute** command.

If RADIUS authentication is enabled, password change is blocked forusers changing their own password. Administrators with the privilege to change passwords for other accounts may do so regardless of whether RADIUS authentication is enabled; all such password changes operate on the local password database.

The **passwd** command cannot be run on the Standby CP. When an admin account or a SecurityAdmin account changes the password for other accounts, it does not prompt for the current password, unless the target account is a factory or root account.

Any chosen password must satisfy the following password strength rules:

- Password contains the minimum required number of lowercase characters.
- Password contains the minimum required number of uppercase characters.
- Password contains the minimum required number of numeric characters
- Password contains the minimum required number of punctuation characters.
- Password must be between minlength and 40 characters long. The minlength parameter is set with the passwdCfg command.
- Password may not contain the colon (:) character.
- Password must satisfy repeated and sequential character constraints.

The password history policy is enforced across all user accounts when the user is setting his own password. The password history policy is not enforced when an administrator sets a password for another user, but the user's password history is preserved and the password set by the administrator is recorded in the user's password history.

The **passwd** command behaves as follows:

- If you are changing your own password, you are prompted to enter the old password and, if your
 entry is valid, you are prompted to enter the new password. Alternately, you may specify the old and
 new password on the command line.
- If a you are changing another user's password with greater privileges than your current login level, you are prompted to enter that user level's old password and, if your entry is valid, you are prompted for a new password.
- If you are changing another user's password, the target account's AD member list must be a subset of your account's AD member list.
- If you are logged in as the root user when changing another user's password, you are not prompted to enter the old password. If you are a factory account, an admin, or SecurityAdmin account, you are not prompted to enter the current password unless the target account is root.
- Changing the password of any user level causes the login session of that account (if logged in) to terminate.

When invoked without an operand, this command changes the password for the current user account.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operand is optional:

user_account

Specifies the user account for which the password is to be changed. The user account must be an existing account, either default or user-created. Only users with accounts of type "root", "factory", "SecurityAdmin", or "admin" can execute this operand and have permission to change passwords for accounts other than their own.

-old old_password

Specifies the old password. This operand is optional; if omitted, the command interactively prompts for the old password.

-new new_password

Specifies the new password. This operand is optional; if omitted and only the old password is specified on the command line, the command interactively prompts for the new password.

DIAGNOSTICS

The system may generate one or more of the following error messages. Refer to the *Fabric OS Message Reference* for more diagnostic information.

RADIUS enabled error

Password change disallowed, RADIUS authentication is enabled.

Password error

Password length, strength, or history policy not met.

"User" is not a valid user name

You have not specified a valid recognized user name on the system.

Permission denied

You do not have permission to change the password for the specified user.

Incorrect password

You have not entered the correct password when prompted for the old password.

Password unchanged

You have entered the carriage return special input case, choosing not to change the password.

Passwords do not match

You have not correctly verified the new password.

Invalid length of password

You have entered a password length that is not between minlength and 40.

Insufficient number of lower case letters

The password you entered contains less than the minimum required number of lowercase characters.

Insufficient number of upper case letters

The password you entered contains less than the minimum required number of uppercase characters.

Insufficient number of digits in password

The password you entered contains less than the minimum required number of numeric characters.

Insufficient number of punctuation characters

You have entered a password that contains less than the minimum required number of punctuation characters.

Password matches one of the previous passwords

The password you entered matches one of the previous passwords.

You must wait longer to change your password

You cannot change the password before the minimum aging period expires.

Password contains invalid characters

The password you entered contains invalid characters.

EXAMPLES To

To change the password for the admin account while logged in as admin:

```
switch:admin> passwd
Changing password for admin
Enter new password:
Re-type new password:
Password changed.
Saving password to stable storage.
Password saved to stable storage successfully.
```

To change the password for user "admin" from an admin account noninteractively:

```
switch:admin> passwd -old password -new adminpass
Password changed.
Saving password to stable storage.
Password saved to stable storage successfully.
```

To change the password for user "brocadeUser" from an admin account noninteractively:

```
switch:admin> passwd -old brocadeUser -old brcdPasswd -new mynewPasswd Password changed.
Saving password to stable storage.
Password saved to stable storage successfully.
```

passwdCfg

Manages the password policies.

SYNOPSIS

passwdcfg --set options value

passwdcfg --disableadminlockout

passwdcfg --enableadminlockout

passwdcfg --setdefault

passwdcfg --showall

passwdcfg --help

DESCRIPTION

Use this command to manage password policies.

Use --set to configure the following password policies:

- Password strength policy
- Password history policy
- Password expiration policy
- Account lockout policy

Password Strength Policy

The password strength policy enforces a set of rules that new passwords must satisfy. Configurable rules include lowercase and uppercase characters, numbers, punctuation occurrences and minimum length values. It is enforced only when a new password is defined. The password strength policy is enforced cross all user accounts. When a password fails more than one of the strength attributes, an error is reported for only one of the attributes at a time.

Password History Policy

The password history policy prevents reuse of a recently used password. The password history policy is enforced across all user accounts when users are setting their own password. It is not enforced when an administrator sets a password for another user, but the user's password history is preserved and the password set by the administrator is recorded in the user's password history.

Password Expiration Policy

The password expiration policy forces expiration of a password after a specified period of time. When a user's password expires, the user must change the password to complete the authentication process. A warning that password expiration is approaching is displayed when the user logs in. The number of days prior to password expiration during which warnings commence is a configurable parameter. Password expiration does not disable or lock out the account. The password expiration policy is enforced across all user accounts except the root and factory accounts.

Account Lockout Policy

The account lockout policy disables a user account when the user exceeds a configurable number of failed login attempts. The mechanism can be configured to keep the account locked until explicit administrative action is taken to unlock the account or locked accounts can be automatically unlocked after a specified period. An administrator can unlock a locked account at any time. Note that the account locked state is distinct from the account disabled state. The account lockout policy is enforced across all user accounts except the root, factory, and SecurityAdmin role accounts. A separate configuration option, available to the SecurityAdmin and Admin role accounts, may be used to enable and disable applications of the account lockout policy to Admin role accounts.

A failed login attempt counter is maintained for each user on each switch instance. The counters for all user accounts are reset to zero when the account lockout policy is enabled. The counter for an individual account is reset to zero when the account is unlocked after the lock-out duration period expires.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command takes as input an operand and its associated arguments. When invoked without operands, the command prints the usage.

--showall

Displays all the password configuration parameters.

--set

Configures a specified password policy. The following arguments are supported:

-lowercase value

Specifies the minimum number of lowercase alphabetic characters that must occur in the password. The default value is 0. The maximum value must be less than or equal to the **-minlength** *value*.

-uppercase value

Specifies the minimum number of uppercase alphabetic characters that must occur in the password. The default value is 0. The maximum value must be less than or equal to the **-minlength** *value*.

-digits value

Specifies the minimum number of numeric digits that must occur in the password. The default value is 0. The maximum value must be less than or equal to the **-minlength** *value*.

-punctuation value

Specifies the minimum number of punctuation characters that must occur in the password. All displayable, non-alphanumeric punctuation characters, except the colon (:), are allowed. The default value is 0. The maximum value must be less than or equal to the **-minlength** *value*.

-minlength value

Specifies the minimum length of the password. The minimum can be set anywhere between 8 and 40 characters. The default value is 8. The total of **-lowercase**, **-uppercase**, **-digits**, **-punctuation** must be less than or equal to **-minlength** *value*.

-history value

Specifies the number of past password values that are disallowed when setting a new password. A value of 1 to 24 can be specified. The default value is 1.

-minpasswordage value

Specifies the minimum number of days that must elapse before a password can be changed. **-minpasswordage** can be set at 0 to 999. The default value is 0. Setting this parameter to a nonzero value discourages a user from rapidly changing a password in order to defeat the password history setting to reuse a recently used password. The **minpasswordage** policy is not enforced when an administrator changes the password for another user.

-maxpasswordage value

Specifies the maximum number of days that can elapse before a password must be changed. This is the password expiration period. **-maxpasswordage** can be set at 0 to 999. Setting this parameter to 0 disables password expiration. The default value is 0. When **-maxpasswordage** is set to a nonzero value, **-minpasswordage** must be set to a value less than or equal to

-maxpasswordage.

-warning value

Specifies the number of days prior to password expiration that a warning of password expiration is displayed. The valid range for **-warning** is 0 to 999. The default value to 0.

-lockoutthreshold value

Specifies the number of times a user can specify an incorrect password during login before the account is locked. The number of failed login attempts is counted from the last successful login. Values for **-lockoutthreshold** range from 0 to 999. Setting this parameter to 0 disables the lockout mechanism. The default value is 0.

-lockoutduration value

Specifies the time, in minutes, after which a previously locked account automatically unlocks. **lockoutduration** values range from 0 to 99999. The default value is 30. Setting this parameter to 0 disables lockout duration, requiring an administrative action to unlock the account. The lockout duration begins with the first login attempt after the lockout threshold has been reached. Subsequent failed login attempts do not extend the lockout period.

--enableadminlockout

Enables the admin lockout policy and sets the config parameter "passwdcfg.adminlockout" to 1. If the parameter "passwdcfg.lockoutthreshold" is set to greater than 0 and Admin Lockout policy is enabled, then, if the number of failed login attempts from the last successful login equals the "passwdcfg.lockoutthreshold", the account gets locked for the "passwdcfg.lockoutduration" duration. The particular account is unlocked manually using **userconfig --change** account_name -u or it is automatically unlocked after "passwdcfg.lockoutduration" duration.

-repeat value

Specifies the length of repeated character sequences that will be disallowed. For example, if the "repeat" value is set to 3, a password "passAAAword" is disallowed because it contains the repeated sequence "AAA". A password of "passAAword" would be allowed because no repeated character sequence exceeds two characters. The range of allowed values is 1 to 40.

-sequence value

Specifies the length of sequential character sequences that will be disallowed. A sequential character sequence is defined as a character sequence in which the ASCII value of each contiguous character differs by one. The ASCII value for the characters in the sequence must all be increasing or all decreasing. For example, if the "sequence" value is set to 3, a password "passABCword" is disallowed because it contains the sequence "ABC". A password of "passABword" would be allowed because no repeated character sequence exceeds two characters. The range of allowed values is 1 to 40. The default value is 1.

--disableadminlockout

Disables the admin lockout policy if already enabled and sets the config parameter "passwdcfg.adminlockout" to 0. By default, admin lockout policy is disabled.

--setdefault

Resets all password policies to their default values.

--help

Displays the command usage.

DIAGNOSTICS

The passwdCfg command may fail for any of the following reasons:

Permission failure

You not permitted to execute the command.

Invalid command line option

An unrecognized command line option was specified.

Minlength value out of range

The **-minlength** value must be between 8 and 40.

Lowercase value out of range

The **-lowercase** *value* specified must be greater than or equal to 0 and less than or equal to **-minlength** *value*.

Uppercase value out of range

The **-uppercase** *value* specified must be greater than or equal to 0 and less than or equal to **-minlength** *value*.

Digits value out of range

The **-digits** value specified must be greater than or equal to 0 and less than or equal to **-minlength** value.

Punctuation value out of range

The **-punctuation** *value* specified must be greater than or equal to 0 and less than or equal to **-minlength** *value*.

Total strength specification out of range

The total of **-lowercase** *value*, **-uppercase** *value*, **-digits** *value*, and **-punctuation** *value* must be less than or equal to **-minlength** *value*.

History value out of range

The -history value must be between 1 and 24.

Minpasswordage value out of range

The -minpasswordage value must be between 0 and 999.

Maxpasswordage value out of range

The -maxpasswordage value must be between 0 and 999.

Warning value out of range

The -warning value must be between 0 and 999.

Invalid password expiration specification

The **-minpasswordage** *value* or **-warning** *value* must be less than or equal to **-maxpasswordage** *value* when **-maxpasswordage** *value* is nonzero.

Lockoutthreshold value out of range

The -lockoutthreshold value must be between 0 and 999.

Lockoutduration value out of range

The **-lockoutduration** value must be between 0 and 99999.

Repeat value out of range

The **-repeat** value must be between 1 and 40.

Sequence value out of range

The **-sequence** value must be between 1 and 40.

EXAMPLES To display the current password configuration parameters:

```
switch:admin> passwdcfg --showall
passwdcfg.minlength: 8
passwdcfg.lowercase: 0
passwdcfg.uppercase: 0
passwdcfg.digits: 0
passwdcfg.punctuation: 0
passwdcfg.history: 1
passwdcfg.minpasswordage: 0
passwdcfg.maxpasswordage: 0
passwdcfg.warning: 0
passwdcfg.lockoutthreshold: 0
passwdcfg.lockoutduration: 30
passwdcfg.status: 0
```

To set password configuration parameters, specifying that a password must contain at least two uppercase characters, and that passwords expire in 90 days from the date they are defined:

```
switch:admin> passwdcfg --set -uppercase 2 \
     -maxpasswordage 90
```

SEE ALSO passwd, userConfig

pathInfo

Displays routing information and statistics along a path covering multiple switches.

SYNOPSIS pathinfo

pathinfo -f FID destination_switch
 [destination_porf] [-r] [-t]

pathinfo destination_switch
[source_port[destination_port[] [-t] [-t]

DESCRIPTION

Use this command to display routing information from a source port on the local switch to a destination port on another switch. The command output describes the exact data path between these ports, including all intermediate switches.

When using **pathInfo** across fabrics connected through an FC Router, the command represents backbone information as a single hop. The command captures details about the FC Router to which ingress and egress EX_Ports are connected, but it hides the details about the path the frame traverses between the ingress EX_Ports to the egress EX_Ports in the backbone.

To use **pathInfo** across remote fabrics, you must specify both the fabric ID (FID) and the domain ID of the remote switch. You cannot use the command to obtain source port information across remote FCR fabrics. When obtaining path info across remote fabrics, the destination switch must be identified by its Domain ID. Identifying the switch by name or WWN is not accepted.

The command does not retry if there is a timeout or failure. It may fail if a switch along the path is busy or does not support this feature.

If the advanced performance tuning (APT) policy in effect on the intermediate switches is not a port-based policy, subsequent data streams may not take the same path as displayed in the **pathInfo** output. Refer to **aptPolicy** for more information on advanced performance tuning policies.

If you specify an inactive port or a path through a switch that does not have active routing tables to the destination, this command describes the path that would be taken if the ports were active. If you specify a destination port that is not active, this command uses the embedded port as the destination.

The ingress and egress points above 256 are specified as port index. Use **switchShow** for a listing of valid port index numbers.

In addition, **pathInfo** can provide statistics on every traversed interswitch link (ISL) that is part of the path. This feature is available only in the interactive command mode.

The routing and statistics information are provided by every switch along the path, based on the current routing table information and statistics calculated continuously in real-time. Each switch represents one hop of the total path.

In a Virtual Fabric environment, **pathInfo** displays port numbers beyond physical port numbers while displaying information for a hop that corresponds to a path in the base fabric. The cost for this hop is the cost of the corresponding path in the base fabric plus a small offset. Refer to the Examples section for an illustration.

Other command options allow the collection of information on the reverse path, or on a user-selected path (source route).

For each hop, this command displays the following fields:

Hop

The hop number. The local switch is hop 0.

In Port

The port on which the switch receives frames. For hop 0, this is source_port.

identified by the port index.

Domain ID

The domain ID of the switch.

Name

The name of the switch.

Out Port

The output port that the frames take to reach the next hop. For the last hop, this is

destination port identified by the port index.

BW

The bandwidth of the output interswitch link (ISL), in Gbps. This parameter does not apply to the embedded port. If the bandwidth is zero, it is displayed as 1 Gbps. For logical interswitch links (LISL) ports, the bandwidth displays as 8 Gbps, the maximum bandwidth on hardware platforms on which LISLs can be formed. In cases where the LISL bandwidth is zero, **pathInfo** displays a bandwidth of 4

Gbps.

Cost

The cost of the output link used by the fabric shortest path first (FSPF) routing protocol. This parameter applies only if the output link is recognized by FSPF.

You can request more detailed statistics for each hop in addition to the routing information. These statistics are presented for the input and output ports for both receive and transmit modes. You can select basic or extended statistics or both when running **pathInfo** in interactive mode. Statistics are not reported for the embedded port. Some throughput values are reported in multiple time intervals, to describe both current path utilization and the average throughput over a larger period of time.

To collect these statistics, this command uses a special **pathInfo** frame that is sent hop-by-hop from the source switch to the destination switch. To prevent such a frame to loop forever if an error occurs, a maximum number of hops for the frame to traverse is enforced. The hop count includes all hops in the direct path from source to destination, and also all the hops in the reverse path, if the tracing of the reverse path is requested. The default value for the maximum hop count is 25.

Basic statistics

Basic statistics report parameters that may indicate ISL congestion along the path. They include the following:

B/s

Bytes per second received or transmitted. This value is reported for multiple time periods displayed in parentheses.

Txcrdz

The length of time, in milliseconds, that the port was unable to transmit frames because the transmit BB credit was zero. The purpose of this statistic is to detect congestion or a device affected by latency. This parameter is sampled at 1 millisecond intervals, and the counter is incremented if the condition is true. Each sample represents 1 ms of time with zero Tx BB Credit. An increment of this counter means that the frames could not be sent to the attached device for 1 ms, indicating degraded performance. This value reports for multiple time periods, displayed in parentheses. Note that other commands, such as **portStatsShow**, may express this value in units other than milliseconds.

Extended statistics

Extended statistics report variables of general interest. They include the following:

F/s

The number of frames received or transmitted per second. This value is reported for multiple time periods, displayed in parentheses.

Words

The total number of 4-byte Fibre Channel words.

Frames

The total number of frames.

Errors

The total number of errors that may have caused a frame not to be received correctly. This includes cyclic redundancy check (CRC) errors, bad end-of-frame (EOF) errors, frame truncated errors, frame-too-short errors, and encoding errors inside a frame.

Reverse path

The path from port A on switch X to port B on switch Y may be different from the path from port B to port depending on the links traversed between a given sequence of switches, or the reverse path may involve different switches. The **-r** option displays routing and statistics information for the reverse path in addition to those for the direct path.

Source route

The source route option allows you to specify a sequence of switches or ports, which the **pathInfo** frame has to traverse to reach the destination. Therefore, the path specified may be different from the one used by actual traffic.

The source route is expressed as a sequence of switches, a sequence of output ports, or a combination of both. The next hop in the source route is described by either the output port to be used to reach the next hop, or the domain ID of the next hop.

The source route can specify a full route from source to destination or a partial route. In a partial route the remaining hops are chosen as the path from the input port on the first hop not listed in the source route to the destination. The maximum hop count is enforced in both cases.

If the source route does not specify all the switches along a section of the path, you can specify a strict or a loose path. A strict source route requires that only the specified switches are reported in the path description. If two switches are specified back-to-back in the source route descriptor but are not directly connected, the switches in-between are ignored. In a loose source route, the switches in-between are reported. The concepts of strict and loose route apply only to the portions of the path described by domains, not to the part described by output ports.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

destination_switch

Specifies the destination switch. To obtain path info in a Layer 2 fabric, the destination switch can be identified by its Domain ID, by the switch WWN, or by the switch name. To obtain path info across remote fabrics connected through an FC Router, the destination switch must be identified by its Domain ID. Identifying the switch by name or WWN is not accepted. This operand is optional; if omitted, the command prompts for input interactively.

source_port

Specifies the port whose path to the destination domain is traced, specified as the port index. The embedded port (-1) is the default. The embedded port can be selected manually by entering the value of MAX_PORT. MAX_PORT stands for the maximum number of ports supported by the local switch.

destination_port

Specifies the port on the destination switch for the path being traced. This operand returns the state of this port. The embedded port (-1) is used by default, or if you specify a destination port that is not active. The destination is specified as the port index.

"-r"

Displays the reverse path in addition to the forward path. This operand is optional.

-t

Displays the command output in traceroute format. When this operand is used, only routing information is displayed. The output includes the time it takes, in microseconds, to reach each hop. Basic and extended statistics are not available in the traceroute format.

When executed without operands, **pathInfo** runs interactively. Specifying a destination switch is required; the values for the source and destination ports can be -1 to indicate the embedded port. Reverse-path tracing is optional. In addition, this command prompts for the following parameters:

max hops

The maximum number of hops that the **pathInfo** frame is allowed to traverse; the default is 25.

Fabric Id

Specifies the Fabric ID. If unspecified, the value defaults to -1 (Default switch FID

128)

basic stats

Whether basic statistics are generated on every link; the default is no.

extended stats

Whether basic statistics are generated on every link; the default is no.

source route

Specifies a sequence of switches or ports that the **pathInfo** frame should traverse; the default is no. If an output port to the next hop is specified, you are not prompted for the domain of the next switch. The domain is determined by the port.

strict source rte

Specifies a strict source route, skipping intermediate switches. When using this option, the source route hops must be specified using the domain rather than the output port.

Timeout

The maximum time allowed waiting for the response in milliseconds. The default is 10000 milliseconds.

EXAMPLES

To display basic path information to a specific domain in command line mode:

switch:admin> pathinfo 91
Target port is Embedded

Нор	In Port	Domain	ID (Name)	Out Port	BW	Cost
0	E	9 (web226)	2	1G	1000
1	3	10 (web229)	8	1G	1000
2	8	8 (web228)	9	1G	1000
3	6	91 (web225)	E	-	_

To display basic path information in traceroute format:

To display basic path information in traceroute format with reverse path option:

To display path information when source port and destination port are provided along with the traceroute option:

To display basic path information to a specific domain in a Virtual Fabric environment (the cost for this hop is the cost of the corresponding path in the base fabric):

```
Target port is Embedded

Hop In Port Domain ID (Name) Out Port BW Cost

0 4 9 2009* - 1500
1 2015* 10 8 1G 1000
2 6 13 E - -
```

To display basic and extended statistics in interactive mode:

switch:admin> pathinfo 13 4

```
switch:admin> pathinfo
Max hops: (1..127) [25]
Fabric Id: (1..128) [-1]
Domain|Wwn|Name: [] 8
Source port: (0..15) [-1]
Destination port: (0..255) [-1]
Basic stats (yes, y, no, n): [no] y
Extended stats (yes, y, no, n): [no] y
Trace reverse path (yes, y, no, n): [no]
Source route (yes, y, no, n): [no]
Timeout: (1..30) [5]
```

pdShow

Displays data from a panic dump file.

SYNOPSIS

pdshow [panic dump file]

DESCRIPTION

Use this command to display data from a panic dump file. The panic dump file contains information that might be useful to determine the cause of the system panic.

When executed without any arguments, this command displays output from the latest panic dump file available on the switch.

If a panic dump file is specified as an argument, the contents of that specific file are displayed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following optional operand:

panic_dump_file

Specify the full path name of a panic dump file.

EXAMPLES

To examine a panic dump file by the name panic_dump located under the directory /tmp:

```
switch:admin> pdshow /tmp/panic_dump
      *** CAUTION ***
    Host PLATFORM (current) is: 'Unknown'
    PLATFORM got from pd file is: 'SW12000'
    Some results shown may be incorrect and/or missing
    It is best if this command is run on same \
    PLATFORM as that of pdfile

perfAddEEMonitor

Adds an end-to-end monitor to a port.

SYNOPSIS

perfaddeemonitor [slot/]port SourceID DestID

DESCRIPTION

Use this command to add an end-to-end performance monitor to a port. The performance monitor counts the number of words received, number of words transmitted, and number of CRC errors detected using either of the following conditions:

- For frames received at the port, the frame SID is the same as and frame DID is the same as DestID;
 both RX_COUNT and CRC_COUNT are updated accordingly.
- For frames transmitted from the port, the frame DID is the same as SourceID and frame SID is the same as DestID; both TX_COUNT and CRC_COUNT are updated accordingly.

To monitor traffic from host A to device B, add a monitor on port 2, specifying 0x050200 as the SID and 0x010100 as the DID. The RX count equals the number of words from host A to device B, whereas the TX count equals the number of words from device B to host A. The CRC count equals the total number of CRC errors for both directions. Adding a monitor on port 1, specifying 0x010100 as SID and 0X050200 as the DID has a similar effect, except the RX and TX counts are interchanged.

To monitor traffic between one Initiator host and one target storage device connected to an Encryption Switch, you must add two monitors because of the manner in which the real initiators or targets transfer data to VIs and VTs. The first monitor would be added between the initiator SID and the virtual initiator DID, and the second monitor would be set up between virtual target SID and the target DID. Refer to the Examples section for details.

Identical monitors cannot be added to the same port. Two monitors are considered identical if they have the same SID and DID values after applying the end-to-end mask.

Execution of this command displays a monitor number, which can be used to manipulate performance monitors.

NOTES

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports, and GbE ports.

On 8G (Condor 2-based) platforms, End-to-End monitors are supported only on F_Ports. On 16G (Condor 3-based) platforms, End-to-End monitor are supported on both F_Ports and E_Ports. When installing an end-to-end monitor on an E_Port, be sure to install the SID and DID in the ingress direction.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port on which the

monitor is to be added, followed by a slash (/).

port

Specifies the number of the port on which the monitor is to be added, relative to its

slot for bladed systems. Use **switchShow** for a list of valid ports.

SourceID

Specifies the 3-byte SID (Source ID) of the originator device. It should be in "0xDDAAPP" format, where DD is domain ID, AA is area ID and PP is AL_PA ID. For example, 0x050200 has a domain ID of 5, an area ID of 2, and an AL_PA ID of 0. SourceID and DestID both cannot be 0x000000.

DestID

Specifies the 3-byte DID (destination ID) of the destination device. It should be in "0xDDAAPP" format, where DD is domain ID, AA is area ID and PP is AL_PA ID. For example, 0x050200 has a domain ID of 5, an area ID of 2, and an AL_PA ID of 0. SourceID and DestID both cannot be 0x000000.

EXAMPLES To add an end-to-end monitor to blade 1 port 2:

```
switch:admin> perfaddeemonitor 1/2 "0x050200" "0x1182ef"
End-to-End monitor number 0 added.
```

To add an end-to-end monitor to an Encryption switch (In this scenario, one target disk storage device connects to the Encryption switch, and an initiator device connects to a DCX backbone. The DCX is directly connected to the Encryption Switch. Two EE monitors are added on port 1 of the Encryption Switch, which is an F_Port that attaches to the target device):

 Get the CryptoTarget container configuration. This command shows the PIDs for the target, the virtual target, the initiator, and the virtual initiator:

```
EncryptionSwitch:Securityadmin> cryptocfg --show \
    -container -all -stat
Encryption group name: brcd
Number of Container(s): 1
Container name:
                      st_target
Type:
EE node:
                       10:00:00:05:1e:53:b8:45

   Initiator ---> VT
                               VI ---> Target
   0x01a000
                 0x0a2001
                            0x0a2002
                                         0x0a0100
```

3. Add an EE monitor on port 1 between the Initiator SID and the virtual initiator DID:

```
EncryptionSwitch:SecurityAdmin> perfaddeemonitor 1 \
     0x0a0100 0x0a2002
 End-to-End monitor number 0 added.
```

4. Add another EE monitor on port 1 between the Virtual Target SID and the Target DID:

```
EncryptionSwitch:SecurityAdmin> perfaddeemonitor 1 \setminus 0 \times 0 = 0 \times 0 = 0
End-to-End monitor number 1 added.
```

5. Display the EE monitors on the Encryption Switch:

SEE ALSO perfDelEEMonitor, perfMonitorClear, perfMonitorShow

perfCfgClear

Clears the previously saved performance monitoring configuration settings from nonvolatile memory.

SYNOPSIS perfcfgclear

DESCRIPTION Use this command to clear the previously saved end-to-end performance monitoring configuration

settings from nonvolatile memory.

NOTES This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE

ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To clear the performance monitoring information from nonvolatile memory:

switch:admin> perfcfgclear

This will clear Performance Monitoring settings in FLASH.

The RAM settings won't change. Do you want to continue? (yes, y, no, n): [no] y

Please wait ...

Performance Monitoring configuration cleared from FLASH.

SEE ALSO perfCfgRestore, perfCfgSave

perfCfgRestore

Restores performance monitoring configuration settings from nonvolatile memory.

SYNOPSIS perfcfgrestore

DESCRIPTION

Use this command to restore the performance monitoring configuration information from nonvolatile memory. This does not restore the information cleared by the **perfCfgClear** command; rather, it restores the configuration from nonvolatile memory. The **perfCfgRestore** command overwrites any configuration changes that were not saved.

NOTES

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To restore the performance monitoring configuration information from nonvolatile memory:

switch:admin> perfcfgrestore
This will overwrite current Performance Monitoring settings
in RAM. Do you want to continue? (yes, y, no, n): [no] y
Please wait ...
Performance monitoring configuration restored from FLASH.

SEE ALSO perfCfgClear, perfCfgSave

perfCfgSave

Saves performance monitoring configuration settings to nonvolatile memory.

SYNOPSIS perfcfgsave

DESCRIPTION

Use this command to save the current Performance Monitor configuration for end-to-end (EE) performance monitors to nonvolatile memory. Configuration changes are saved persistently across power cycles.

The number of monitors that can be saved to flash memory is limited as follows:

- 16 EE monitors per port
- A total number of 512 EE monitors per switch

When the number of monitors per port or switch exceeds the limit, the following message is displayed: "Performance monitor count has exceeded limit. Some monitors have been discarded."

NOTES

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE ports.

Monitors created by Web Tools are not saved in persistent memory.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To save the current performance monitoring configuration to firmware:

```
switch:admin> perfcfgsave
This will overwrite previously saved Performance Monitoring
settings in FLASH. Do you want to continue?
    (yes, y, no, n): [no] y
Please wait ...
Performance monitoring configuration saved in FLASH.
```

SEE ALSO perfCfgClear, perfCfgRestore

perfClearAlpaCrc

Clears the CRC error count associated with a port and arbitrated loop physical address (AL_PA).

SYNOPSIS perfclearalpacrc [slot/]port [ALPA]

DESCRIPTION

Use this command to clear a specific cyclic redundancy check (CRC) error counter associated with a specific port and AL_PA, or all such counters on a port.

NOTES

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on all platforms. Refer to the Fabric OS Administrator's Guide for specific hardware support.

OPERANDS

EXAMPLES

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port on which the

monitor is to be added, followed by a slash (/).

port

Specifies the number of the port on which the monitor is to be added, relative to its

slot for bladed systems. Use switchShow for a list of valid ports.

ALPA

Specifies the AL_PA address to clear the CRC error counter for a particular device. This operand is optional; if ALPA is not specified, this command clears the counters for all devices attached to the specified port.

To clear the CRC count on a particular AL_PA on a port and then clear the CRC count for all AL_PAs on a port:

```
switch:admin> perfclearalpacrc 2/15 0x59
CRC error count at ALPA 0x59 on port 31 is cleared.
switch:admin> perfclearalpacrc 2/15
This will clear all ALPA CRC Counts on port 31
Do you want to continue? (yes, y, no, n) y
Please wait ...
All alpa CRC counts are cleared on port 31.
```

SEE ALSO perfShowAlpaCrc

perfDelEEMonitor

Deletes one or all end-to-end performance monitors from a port.

SYNOPSIS perfdeleemonitor [slot/]port [monitorId]

DESCRIPTION Use this command to delete an end-to-end performance monitor from a port, or all such monitors

associated with a port.

NOTES This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE

ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port on which to delete

the monitor, followed by a slash (/).

port

Specifies the number of the port on which the monitor is to be deleted, relative to

its slot for bladed systems. Use switchShow for a list of valid ports.

monitorId

Specifies the numeric key of the monitor to be deleted. The key is defined when a monitor is created. Use **perfMonitorShow** to determine the monitor key. This operand is optional. If no operand is specified, this command deletes all

end-to-end monitors associated with the port.

EXAMPLES To delete an end-to-end monitor on a port, or all such monitors:

```
switch:admin> perfdeleemonitor 7/2 5
End-to-End monitor number 5 deleted

switch:admin> perfdeleemonitor 7/2
This will remove ALL EE monitors on port 2, \
   continue? (yes, y, no, n): [no] y
```

SEE ALSO perfAddEEMonitor, perfMonitorShow

perfHelp

Displays performance monitoring help information.

SYNOPSIS perfhelp

DESCRIPTION Use this command to display the help commands available for performance monitoring.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display commands related to performance monitoring:

switch:admin> perfhelp

perfaddeemonitor Add end-to-end monitor

perfcfgclear Clear Performance settings from FLASH

perfcfgrestore Restore Performance configuration from

FLASH

perfcfgsave Save Performance configuration to FLASH perfclearalpacrc Clears the CRC error count associated

with a port and Arbitrated Loop

Physical Address (AL_PA).

perfcleareemonitor Clears statistics counters of one or more

end-to-end performance monitors.

perfdeleemonitor Delete end-to-end monitor

perfhelp Print Performance Monitoring help info perfmonitorclear Clear end-to-end/filter-based/ISL monitors

Show end-to-end/filter-based/ISL monitors perfmonitorshow

Show monitor availability perfresourceshow

perfsetporteemask Set overall mask for end-to-end monitors Get ALPA CRC count by port and ALPA perfshowalpacrc Show user-defined end-to-end monitors perfshoweemonitor Show the current end-to-end mask perfshowporteemask

perfttmon Configure bandwidth usage monitor

SEE ALSO None

perfMonitorClear

Clears counters of end-to-end and ISL performance monitors on a port.

SYNOPSIS

perfmonitorclear --class monitor_class

[slot/]port [monitorId]

DESCRIPTION

Use this command to clear counters for performance monitors on a port, specified by class. Monitor classes include end-to-end monitors (EE) and interswitch link monitors ISL).

Issuing the **portStatsClear** command on a port clears all end-to-end and filter-based monitors (but not ISL monitors) for all the ports in the same quad.

NOTES

Management of filter-based monitors is provided through the Frame Monitor management interface (**fmMonitor**). Use **fmMonitor** to configure and manage filter-based monitors.

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--class monitor_class

Specifies the monitor class as one of the following: **EE** (end-to-end) or **ISL** (interswitch link). These values are case-sensitive. This operand is required.

slot

For bladed systems only, specifies the slot number of the port on which the

monitor counter is to be cleared, followed by a slash (/).

port

Specifies the number of the port on which the monitor counter is to be cleared, relative to its slot for bladed systems. Use **switchShow** for a list of valid ports.

monitorId

Specifies the numeric key of the monitor to be deleted. The key is defined when a monitor is created and can be displayed with the **perfMonitorShow** command. This operand is optional. If no operand is specified, this command clears all monitor counters of the specified *monitor_class* on the port. This operand does not apply to ISL monitors.

EXAMPLES

To clear statistics counters for an end-to-end monitor:

```
switch:admin> perfmonitorclear --class EE 1/2 5
End-to-End monitor number 5 counters are cleared
switch:admin> perfmonitorclear --class EE 1/2
This will clear ALL EE monitors' counters on port 2, \
   continue? (yes, y, no, n): [no] y
```

To clear statistics counters for an ISL monitor:

```
switch:admin> perfmonitorclear --class ISL 1
This will clear ISL monitor on port 1, continue? \
    (yes, y, no, n): [no] y
```

SEE ALSO perfAddEEMonitor, perfMonitorShow

perfMonitorShow

Displays end-to-end and interswitch link performance monitors on a port.

SYNOPSIS perfmonitorshow -- class monitor_class

[slot/]port [interval]

DESCRIPTION

Use this command to display End-to-End (EE) performance monitors on a port. If *interval* is specified, the command displays a snapshot of the traffic at the specified *interval*. If no interval is specified, this command displays the following information:

Key

The monitor number.

SID

The source Port ID.

DID

The destination Port ID.

Owner_app

The owner application: TELNET, WEB_TOOLS, or API.

Tx_count

The number of FC words transmitted.

Rx_count

The number of FC words received.

Owner_ip_addr

The IP address of the originator that created the EE monitor. Displays the IPv6 address if applications pass the IP address while adding the monitor. If the monitor is added using performance monitor commands, this field displays N/A.

NOTES

ISL Monitors are deprecated as of Fabric OS v7.0.0. Management of filter-based monitors is no longer supported with this command; it is now provided through the Frame Monitor management interface (fmMonitor).

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--class monitor_class

Specifies the monitor class as one of the following: EE (end-to-end) or ISL

(interswitch link). These values are case-sensitive.

slot

For bladed systems only, specifies the slot number of the port on which to display

the monitor, followed by a slash (/).

port

Specifies the number of the port on which to display the monitor, relative to its slot

for bladed systems. Use switchShow for a listing of valid ports.

interval

The interval value must be greater than or equal to 5, and it must be a multiple of 5. In the case of end-to-end monitor, Tx and Rx counts are displayed in the unit of byte when this operand is specified. This operand is optional; if the operand is not specified, this command displays cumulative counts.

EXAMPLES To display EE monitors on port 8:

```
switch:admin> perfmonitorshow --class EE 2/8
There are 8 end-to-end monitor(s) defined on port 8.
```

]	KE	Y SID	DID (OWNER_A	PP TX_COUNT	RX_COUNT	OWNER_IP_A	ADDR
	 1	0vfffff2	0~000002	TELNET	0x000000000000000	0 0~00000		NT / 7\
								,
	2	0xfffff3	0×000003	\mathtt{TELNET}	$0 \times 0000000000000000$	0.0x000000	0000000000	N/A
	3	0xfffff4	0×000004	TELNET	0x0000000000000000	0 0x00000	0000000000	N/A
	4	0xfffff5	0×000005	TELNET	0x0000000000000000	0 0x00000	0000000000	N/A
	5	0xfffff6	0x000006	TELNET	0x000000000000000	0 0x00000	0000000000	N/A
	6	0xfffff7	0x000007	TELNET	0x000000000000000	0 0x00000	0000000000	N/A

	0	0x000000	0x1182ef	TELNET	0x000000000000000	0 0x000000	0000000000	N/A

To display end-to-end monitors on a port at an interval of every 5 seconds:

```
switch:admin> perfmonitorshow --class EE 8 5
```

```
Showing EE monitors 8, 5: Tx/Rx are # of bytes
```

	-	0		1		2		3		4		5		6		7
-																
7	Гх	Rx	Tx	Rx												
=	==:	===	==	===	==	===	==	===	==	===	==	===	==	===	==	===
()	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
()	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

To display ISL monitor information on a port:

```
switch:admin> perfmonitorshow --class ISL 1/1
Total transmit count for this ISL: 1462326
Number of destination domains monitored: 3
Number of ports in this ISL: 2
Domain 97: 110379 Domain 98: 13965
Domain 99: 1337982
```

SEE ALSO perfMonitorClear, perfAddEEMonitor

perfResourceShow

Displays performance monitor resources for a logical switch.

SYNOPSIS perfresourceshow --portttRes [[slot/]porf]

perfResourceShow --eeRes [[slot/]port]

perfResourceShow --fabmodeRes

perfResourceShow --installed [[s/ot/]port]

perfResourceShow --help

DESCRIPTION

Use this command to determine the physical resources available to support the installation of performance monitors on a logical switch port.

In a Virtual Fabric environment, performance monitors installed on a logical switch share the physical resources of the switches that make up the base fabric. To make efficient usage of existing system resources, such as link table size for all supported monitors, the resources reserved for a given logical switch are allocated when the first monitor is installed on a port belonging to that logical switch. The resources are de-allocated when the last monitor installed on a given partition is removed.

This command displays the resource availability for the current logical switch context. The display includes the maximum of supported monitors, the number of monitors currently installed, and the remaining available resources.

In a non-Virtual Fabric environment, this command displays the resources for the switch.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following optional operands:

slot

For bladed systems only, specifies the slot number of the port for which to display

the resources, followed by a slash (/).

port

Specifies the number of the port for which to display the resources, relative to its

slot for bladed systems. Use **switchShow** for a listing of valid ports.

--portttRes

Displays the number of Top Talkers that can be installed on a specified port. If no port is specified, this command displays the resources for all ports on the current

logical switch.

--eeRes

Displays the number of EE monitors that can be supported on the specified port. If

no port is specified, this command displays the resources for all ports on the

current logical switch.

--fabmodeRes

Displays whether fabric mode Top Talkers are running on the current logical

switch. A port is not required with this operand.

--installed

Displays the monitor types installed on a specified port.

--help

Displays the command usage.

EXAMPLES To display the number of Top Talkers that can be installed on the current logical switch:

switch												
Max						Slot/PortRange						
4 4 Port	0 2 list	info	3 2 ormat	cion		2/2 3/5	13

(output truncated)									

To display the number of EE monitors that can be installed on port 10:

```
switch:admin> perfresourceshow --eeRes 2/10
```

slot/Port	Available	Installed
=========	========	==========
2/0	30	3

To display the status of TT fabric mode on the current logical switch:

```
switch:admin> perfresourceshow --fabRes
Maximum Installed Available
```

To display the types of monitors installed on port 2/10:

```
switch:admin> perfresourceshow --installed 2/0
Top Talker Fabric mode: Not Installed
Top Talker F-Port mode: Not Installed
EE monitor: Not Installed Filter monitor: Installed ISL monitor: Not Install
```

SEE ALSO perfAddEEMonitor, perfTTmon

perfSetPortEEMask

Sets the overall mask for end-to-end (EE) performance monitors.

SYNOPSIS per

perfsetporteemask [s/ot/]port

"TxSIDMsk" "TxDIDMsk" "RxSIDMsk" "RxDIDMsk"

DESCRIPTION

Use this command to set the mask for an end-to-end (EE) performance monitor. This command allows selecting the Fibre Channel frames for which to collect performance statistics. When setting the EE mask on a port, all existing EE monitors on that port are deleted.

This command controls all three address fields (Domain ID, Area ID, and AL_PA ID) of both the source ID and destination ID, which can be used to trigger the monitor.

The address mask is of the form "dd:aa:pp", where "dd" is the Domain ID mask, "aa" is the Area ID mask, and "pp" is AL PA ID mask.

Specify the following values to turn a specific field on or off:

00

Specifies that the field does not trigger EE monitors.

ff

Specifies that the field does trigger EE monitors.

The default EE mask value is 0xffffff.

When a mask is set (0xff), the corresponding field triggers the monitor. If the mask is unset (0x00), the corresponding field is ignored.

For example, "00:ff:00" uses only the Area ID to trigger the EE monitor.

There is only one EE mask per port. The mask is applied to all eight EE monitors available on a port. The default EE mask value upon power-on is already set. When ISL monitoring is enabled, the EE mask on E_Ports is controlled automatically and existing mask values for E_Ports are over-written.

NOTES

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, this operand specifies the slot number of the port on

which the monitor is to be updated, followed by a slash (/).

port

Specifies the number of the port on which the EE mask is to be updated, relative

to its slot for bladed systems. Use **switchShow** for a list of valid ports.

TxSIDMsk

Specify the transmitting source ID mask in *dd:aa:pp* format, with quotation marks, where *dd* is the domain ID mask, *aa* is the Area ID mask, and *pp* is AL_PA ID mask. For example, "00:ff:00" uses only the Area ID to trigger the EE monitor.

Specify the following values to turn a specific field on or off:

00

Specifies that the field does not trigger EE monitors.

ff

Specifies that the field does triggers EE monitors.

TxDIDMsk

Specify the transmitting Destination ID mask, in quotation marks, in dd:aa:pp

format.

RxSIDMsk

Specify the receiving Source ID mask, in quotation marks, in dd:aa:pp format.

RxDIDMsk

Specify the destination ID mask, in quotation marks, in dd:aa:pp format.

EXAMPLES To set the overall mask for end-to-end monitors on a port:

```
switch:admin> perfsetporteemask 1/6 "00:00:00"
    "ff:ff:ff" "00:ff:ff" "ff:00:00"
Changing EE mask for this port will cause ALL EE \
    monitors on this port to be deleted.
continue? (yes, y, no, n): [no] y
The EE mask on port 6 is set and EE Monitors \
    on this port are deleted
```

SEE ALSO perfAddEEMonitor, perfShowPortEEMask

perfShowAlpaCrc

Displays the CRC error count by port or by arbitrated loop physical address (AL_PA).

SYNOPSIS perfshowalpacrc [slot/]port [ALPA]

DESCRIPTION

Use this command to display the cyclic redundancy check (CRC) error count of one or all devices attached to a port. If the AL_PA operand is specified, only the CRC count for that AL_PA device is displayed. If the AL_PA operand is not specified, the CRC count for all the AL_PA devices on a specified port are displayed.

CRC count is a 64-bit counter. The CRC count value is displayed in hexadecimal.

NOTES

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on all platforms. Refer to the *Fabric OS Administrator's Guide* for specific hardware support.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be displayed,

followed by a slash (/).

port

Specifies the number of the port to be displayed, relative to its slot for bladed

systems. Use **switchShow** for a list of valid ports.

ALPA

Specify the AL_PA address to get the CRC errors for a specific device. This operand is optional; if the operand is omitted, this command displays CRC error

counts for all devices attached to the specified port.

EXAMPLES

To display the CRC error count for all AL_PA devices on a port:

switch:admin>	perfshowalpacrc 2/4
ALPA	CRC_ERROR_COUNT
0x01	0
0x03	0

SEE ALSO

perfClearAlpaCrc

perfShowPortEEMask

Displays the current address mask for end-to-end performance monitors on a port.

SYNOPSIS perfshowporteemask [slot/]port

DESCRIPTION

Use this command to display the current mask shared across all end-to-end (EE) performance monitors of a port. There are only two commands that can modify the value of the EE mask: **perfSetPortEEMask** and **perfCfgRestore**.

The end-to-end mask has 12 fields:

```
TxSID Domain: on
TxSID Area: on
TxSID ALPA: on
TxDID Domain: on
TxDID Area: on
TxDID ALPA: on
RxSID Domain: on
RxSID Area: on
RxSID Area: on
RxSID ALPA: on
RxDID Domain: on
RxDID Domain: on
RxDID Area: on
```

The fields that are marked "on" trigger end-to-end monitors. The default value of the EE mask for all fields is "on."

NOTES

This command requires an Advanced Performance Monitoring license.

This command is not supported on virtual FC ports (VE/VEX_Port), EX_Port, M (Mirror) ports and GbE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

slot

For bladed systems only, this operand specifies the slot number of the port on which the monitor is to be displayed, followed by a slash (/).

port

Specifies the number of the port on which the monitor is to be displayed, relative to its slot for bladed systems. Use **switchShow** for a list of valid ports.

EXAMPLES

To display the end-to-end mask on a port:

```
switch:admin> perfshowporteemask 2/4
The EE mask on port 20 is set by application NONE

TxSID Domain: on
TxSID Area: on
TxSID ALPA: on
TxDID Domain: on
TxDID Area: on
TxDID ALPA: on
RxSID Domain: on
```

RxSID Area: on RxSID ALPA: on RxDID Domain: on RxDID Area: on RxDID ALPA: on

SEE ALSO perfAddEEMonitor, perfDelEEMonitor, perfSetPortEEMask

perfTTmon

Installs the Top Talker monitor in the specified mode.

SYNOPSIS

perfttmon

Port Mode:

perfttmon --add egress | ingress [slot/]port

perfttmon --show [slot/]port [number_of_flows] [wwn| pid]

perfttmon --delete [[slot/]port | -all | -sconfig]

Fabric Mode:

perfttmon --add fabricmode

perfttmon --show dom domain id [number_of_flows] [wwn| pid]

perfttmon --delete fabricmode

perfttmon --help

DESCRIPTION

Use this command to install the Top Talker monitor. The Top Talker feature provides real-time information about the top 'n' bandwidth consuming flows from a set of a large number of flows passing through a specific point in the network (after initial stabilization).

Top Talkers can display between 1 and 32 flows depending on hardware platform. The maximum flows displayed are as follows:

32

For the Brocade 300, 5100, 5300, 6510, 8000 (FC Ports only) FC8-xx, and FC16-xx port blades.

16

For the Brocade 5000.

Top Talker supports the following two modes, **Port Mode** and **Fabric Mode**:

- In Port Mode, Top Talker is installed at the port level to measure the traffic flowing through the port to different destinations. The output displays the data in a sorted order based on the data rate of each flow.
- In Fabric Mode, Top Talker measures the top "n" bandwidth using flows on a given switch. Top Talker installs only on E_Ports and measures the data rate of all the possible flows in the fabric. Flow is a pair of communicating FC addresses (SID and DID). Top Talkers in Fabric Mode and EE monitors are mutually exclusive. EE monitors must be removed from all switches before enabling fabric mode.

NOTES

This command requires an Advanced Performance Monitor license.

Top Talkers are incompatible with Frame Redirection, and therefore this feature is not supported on the Brocade Encryption switch for encrypted data traffic.

Top Talkers are not supported on embedded platforms.

Top Talkers are not supported on FCoE ports or ports configured as mirror ports. Top Talkers are not supported on VE Ports. EX Ports. VEX Ports.

You cannot install a Top Talker and an End-to-End Monitor on the same port. Brocade recommends against installing a Top Talkers and an End-to-End Monitor on the ports belonging to the same ASIC chip.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port on which to install Top Talkers, followed by a slash (/).

port

Specifies the number of the port on which the Top Talker is to be installed, relative to its slot for bladed systems. Use **switchShow** for a list of valid ports.

On 8G (Condor 2-based) platforms, port-based Top Talkers are supported only on F_Ports. On 16G (Condor 3-based) platforms, port-based Top Talkers are supported on both F_Ports and E_Ports.

Port-level Top Talker commands:

--add

Installs the Top Talker monitor on a specified F Port or E Port.

egress | ingress

Used with the **--add** option to specify the direction in which the traffic is monitored as incoming or outgoing. This operand is required.

--show

Displays the top talking flows on a specified port.

number of top talking flows

Specifies "n" top talking flows. Valid values are between 1 and 32. If a value greater than 32 is entered, Top Talker displays counters for only 32 flows and a warning message. This operand is optional; if omitted, the command displays the top 8 flows.

wwn | pid

Specifies the output display as either WWN or PID format. This operand is optional. If omitted, the command displays in WWN format.

--delete

Deletes existing Top Talker monitors on a specified F_Port or E_Port. You can specify a single monitor by its port number, or you can specify all monitors. The **-sconfig** option deletes all stale monitors.

-all

Deletes all Top Talker monitors from online ports.

-sconfig

Deletes all stale Top Talker entries from the configuration file. A Top Talker monitor is considered stale when it can no longer monitor due to a configuration change, but it still exists in the persistent configuration. For example, a Top Talker becomes stale when a port configured for Top Talker goes offline. The **-sconfig** option provides a mechanism for deleting the Top Talker monitors, as well as the configuration keys of all ports on Condor 2-based platforms, and of all offline ports belonging to a port blade that has been removed from the chassis. When a stale Top Talker entry is still present in the configuration file, you cannot enable FC routing services.

Fabric Mode Top Talker commands:

--add fabricmode

Installs the Top Talker monitor on all switches in the fabric. When a new switch joins the fabric, this command must be run again on the switch. The TT configuration information is not propagated automatically to the new switch. In a mixed chassis configuration containing both 8G and 16G port blades, fabric mode is blocked when FCR is enabled. Port-level Top Talkers will be allowed on 16G blades but not on 8G blades when FCR is enabled. When you insert an 8G port blade into a chassis with fabric mode and FCR enabled, the blade is faulted. Use the **fosConfig** command to disable FCR or disable the fabric mode Top Talker.

--show

Displays the Top Talking flows on the switch for a given domain ID.

dom dom_id

Specifies the domain ID for the flow display.

number of top talking flows

Specifies "n" Top Talking flows. Valid values are between 1 and 32. If a value greater than 32 is entered, Top Talker displays counters for only 32 flows and a warning message. This operand is optional; if omitted, the command displays the top 8 flows.

wwn | pid

Specifies display as either WWN or PID format. This operand is optional; if omitted, the command displays in WWN format.

--delete fabricmode

Deletes the Fabric Mode Top Talker.

--help

Displays the command usage.

EXAMPLES

To add an F_Port Top Talker to blade 1 port 2 (which should be an F_Port):

```
Switch:admin> perfttmon --add ingress 1/2
```

To delete the F_Port Top Talker:

```
switch:admin> perfttmon --del 1/2
```

To add the Fabric Mode Top Talker:

```
Switch:admin> perfttmon --add fabricmode
```

To delete the Fabric Mode Top Talker:

```
Switch:admin> perfttmon --del fabricmode
```

To display the Fabric Mode Top Talker output:

Switch:admin> perfttmon --show dom 1 pid

========			
Src_PID	Dst_PID	MB/sec	Potential E-Ports
========	========		=======================================
0x03f600	0x011300	121.748	2/0,2/2,2/3
0x03f600	0x011300	121.748	3/14,3/15

To identify and delete a stale Top Talker for an F_Port (the F_Port belonged to a blade that has been removed):

```
Switch:admin> configshow -a | grep perf
  perf.ToptalkerEnabledonC2:1

policy

Displays or modifies the encryption and authentication algorithms for security policies.

SYNOPSIS

policy option type number

[-enc method] [-auth algorithm] [-pfs value] [-dh group] [-seclife seconds]

DESCRIPTION

Use this command to display or modify the encryption and authentication algorithms for security policies. You can configure a maximum of 32 Internet key exchange (IKE) and 32 Internet protocol security (IPSec) policies.

Each FCIP tunnel is configured separately and may have the same or different IKE and IPSec policies.

Policies cannot be altered. To change the parameters associated with a current IKE or IPSec policy, that policy must be deleted and re-created with new parameters.

A policy cannot be deleted while an active FCIP tunnel is using it.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operands are required:

option

Specifies the action to take. Actions include the following:

--create

Creates the policy.

--delete

Deletes the policy.

--show

Displays the policy.

type

Specifies the policy type. Types include the following:

ike

Internet key exchange.

ipsec

Internet protocol security.

number

Specifies the numeric ID of the policy. Valid values are 1 to 32, and ALL with the --show option.

The following operands are optional:

-enc method

Specifies the encryption algorithm. The default is AES-128. Methods include the

following:

3DES

Triple data encryption standard, 168-bit key.

AES-128

Advanced encryption standard, 128-bit key.

AES-256

Advanced encryption standard, 256-bit key.

-auth algorithm

Specifies the authentication algorithm. The default is SHA-1. Algorithms include

the following:

SHA-1

Secure hash algorithm.

MD5

Message digest 5.

AES-XCBC

Advanced encryption standard. Valid only with IPSec.

-pfs value

Specifies the perfect forward secrecy. This operand is valid only with IKE policies.

Values are on (default) or off.

-dh group

Specifies the Diffie-Hellman group used in PFS negotiation. This operand is valid

only with IKE policies. The default is 1. Values include the following:

1

Fastest as it uses 768 bit values, but least secure.

14

Slowest as it uses 2048 bit values, but most secure.

-seclife seconds

Security association lifetime in seconds. A new key is renegotiated before the

specified length of time expires. The valid range for seconds is 28800 to

250000000 or 0. The default is 28800.

EXAMPLES To create a new policy:

```
switch:admin> policy --create ike 10 -enc 3des -auth md5
```

The following policy has been set:

IKE policy 10

Authentication Algorithm: MD5

Encryption: 3DES

Perfect Forward Secrecy: 0 Diffie-Hellman Group: 1 SA Life (seconds): 28800

To display a policy setting:

switch:admin> policy --show ipsec 1

IPSec policy 1

Authentication Algorithm: SHA-1

Encryption: 3DES

SA Life (seconds): 28800

```
To display all IKE policy settings:
   switch:admin> policy --show ike all
   IKE Policy 1
   Authentication Algorithm: SHA-1
   Encryption: AES-128
   Perfect Forward Secrecy: on
   Diffie-Hellman Group: 1
   SA Life (seconds): 28800
   IKE Policy 29
   _____
   Authentication Algorithm: SHA-1
   Encryption: AES-128
   Perfect Forward Secrecy: on
   Diffie-Hellman Group: 1
   SA Life (seconds): 28800
   Operation Succeeded
To display all IPSec policy settings:
   switch:admin> policy --show ipsec all
   IPSec Policy 2
   _____
   Authentication Algorithm: SHA-1
   Encryption: AES-128
   SA Life (seconds): 28800
   IPSec Policy 29
   _____
   Authentication Algorithm: SHA-1
   Encryption: AES-128
   SA Life (seconds): 28800
   Operation Succeeded
To change (delete and re-create) a policy:
    switch:admin> policy ike --delete 10
    This policy has been successfully deleted.
    switch:admin> policy ike --create 10 -enc \
        aes-128 -auth sha-1
    The following policy has been set:
    IKE policy 10
    _____
    Authentication Algorithm: SHA-1
    Encryption: AES-128
    Perfect Forward Secrecy: 0
    Diffie-Hellman Group: 1
    SA Life (seconds): 28800
To delete a policy:
    switch:admin> policy ike --delete 10
```

The policy has been successfully deleted.

SEE ALSO portCfg, portCfgShow, portShow

portAddress

Assigns the lower 16 bits of the Fibre Channel Port ID.

SYNOPSIS

portaddress --bind [slot/]port [16-bit_address] [--auto]

portaddress --unbind [s/ot/]port

portaddress --show [[s/ot/]port]

portaddress --findPID 24-bit Port ID

portaddress --help

DESCRIPTION

Use this command to bind the 16-bit address to the lower two bytes of a port 24-bit Fibre Channel address, or to unbind the currently bound address for the specified port. Changes effected by this command are persistent across reboots and power cycles.

The port must be offline to bind an address and not currently bound to another address. If the port is currently bound to another address, use this command with the **--unbind** option to unbind the port.

This command returns an error if the chosen address is in use or is bound to another port. If the address is currently assigned to another port, use this command with the **--findPID** option to identify the port that is bound to that address, and then unbind the port.

The command provides a **--show** option that displays the currently bound address for a specified port or for all ports. Alternately, you can use the **--findPID** option to display the port currently bound to a specified port ID (PID).

NOTES

This command is supported on the Brocade DCX, DCX-4S, DCX 8510-8, and DCX 8510-4 on all logical switches including the Default Switch. Virtual Fabrics must be enabled. It is also supported on the Brocade 300, 5100, 5300, 6510, 7800, and VA-40FC, regardless of Virtual Fabrics status.

This command is not supported on embedded platforms.

If a blade port is qualified to be in a user-created logical switch on a Brocade XDCX, DCX-4S, DCX 8510-4 or DCX 8510-8, this feature is supported on those ports. In the Default Switch, AP blades such as the Brocade FCOE10-24 or FS8-18 are not supported, when dynamic area mode is enabled. This is enforced by the software.

Dynamic Area Mode and WWN-Based persistent PID must be enabled on the switch before you can assign an address with this command. Refer to the **configure** command for more information.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--bind

Assigns the lower two bytes of the Fibre Channel address to the specified port.

slot

Specifies the slot number on bladed systems, followed by a slash (/).

port

Specifies the port number, relative to its slot on bladed systems.

16-bit_address

Specifies the 16-bit address to be bound to the FC address. Note that only the upper 10 bits of the PID can be used for a unique route. Therefore, not all addresses in the 16-bit range are available.

--auto

Enables autobinding on the specified port. If the auto feature is enabled, the entire area field of the PID is bound to a single port. With 10-bit routing, up to 4 ports can share the same 8-bit area field of the PID. This address assignment mode dedicates all four unique routes to a single port. By default, auto is off. This operand is optional; if unspecified, the default is used.

--unbind

Removes both the address and any automode override configuration from the specified port.

--show

Displays the currently bound address attributes for the specified port. This command shows the lowest two bytes of the Fibre Channel address as well as the current setting for automode. If a port is not specified, the display shows the Partition Address Mode value (0, 1, or 2) and all ports on the current partition. A -1 is displayed for ports that have not been assigned an area. Areas are dynamically assigned an address as they are added to a partition. The Partition Address Mode value is set by the **configure** command (Enable a 256 Area Limit).

--findPID

Displays the port (slot and port offset) of the port that is currently assigned the provided address. This command applies the 10-bit area mask to the provided PID and returns the port that has been assigned the specified address. Therefore not all 24 bits are required to match exactly.

24-bit_Port_ID

Specifies the 24-bit Fibre Channel port address. This operand is required with the **--findPID** option. This command applies the 10-bit area mask to the provided PID and returns the port hat has been assigned the specified address. Therefore not all 24 bits are required to match.

--help

Displays the command usage.

EXAMPLES

To bind a 16-bit address to the low two bytes of a port 24-bit Fibre Channel address:

```
switch:admin> portaddress --bind 5/18 0x1a00
```

To unbind a given address from a port:

```
switch:admin> portaddress --unbind 5/18 0x1a00
```

To display all port address bindings on the current partition:

```
switch:admin> portaddress --show

```
switch:admin> portaddress --findPID 0x2400
```

SEE ALSO None

portAlpaShow

Displays the Arbitrated Loop Physical Addresses (AL_PAs) of devices attached to a port.

SYNOPSIS portalpashow [s/ot/]port

DESCRIPTION Use this command to display the AL_PAs of devices connected to a port, and whether these devices are

public or private. If the specified port is not an active FL_Port or if no AL_PAs are present, this command

prints an error.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to display, followed by

a slash (/).

port

Specify the port number to display, relative to its slot for bladed systems. Use

switchShow to list valid ports.

EXAMPLES To display the AL_PAs of a port:

switch:user> portalpashow 4/14

AL_PA type AL_PA type AL_PA type

0xe2 public 0xe4 public

SEE ALSO switchShow

portBeacon

Sets port beaconing mode.

SYNOPSIS portbeacon --enable [slot/]port

portbeacon --disable [slot/]port

portbeacon --show [s/ot/]port

portbeacon --help

DESCRIPTION

Use this command to enable or disable beaconing mode on a specified port.

When beaconing mode is enabled on a port, the port LED flashes amber and green for 2.5 seconds each in an alternating pattern. The beaconing mode continues until you turn it off. Beaconing mode is useful if you are trying to locate a specific port.

Beaconing mode takes over the port LEDs. The normal flashing LED pattern associated with an active, faulty, or disabled port is suppressed, and only the beaconing pattern is shown. Other commands are still executable and functional. However, if diagnostic frame-based tests such as **portLoopbackTest** are executed, the diagnostic LED pattern is interleaved with the beaconing pattern. Running switch beaconing or HBA- side (E2E) beaconing also overwrites the pattern.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port group to display,

followed by a slash (/).

port

Specifies the number of the port to be configured, relative to its slot for bladed

systems. Use switchShow for a listing of valid ports.

--enable

Enables beaconing mode on the specified port.

--disable

Disables beaconing mode on the specified port.

--show

Displays the port beaconing mode on the specified port as ON or OFF.

--help

Displays the command usage.

EXAMPLES

To enable beaconing mode on a port:

```
switch:admin> portbeacon --enable 1/0
```

To disable beaconing mode on a port:

switch:admin> chassisbeacon --disable 2/1

To display beaconing mode on a port:

switch:admin> chassisbeacon --show 2/1 PortBeacon status of : slot 2, port 1 is ON

SEE ALSO chassisBeacon, switchBeacon

portBufferShow

Displays the buffer usage information for a port group or for all port groups in the switch.

SYNOPSIS portbuffershow [[s/ot/]port]

DESCRIPTION

Use this command to display the current long distance buffer information for the ports in a port group. The port group can be specified by giving any port number in that group. If no port is specified, then the long distance buffer information for all of the port groups of the switch is displayed.

The following long distance information is displayed:

User Port

Index number of the port.

Port Type

E (E_Port), F (F_Port), G (G_Port), L (L_Port), or U (U_Port).

Lx Mode

Long distance mode.

L0

Link is not in long distance mode.

LE

Link is up to 10 km.

LD

Distance is determined dynamically.

LS

Distance is determined statically by user input.

Max/Resv Buffers

The maximum or reserved number of buffers that are allocated to the port based on the estimated distance (as defined by the *desired_distance* operand of the **portCfgLongDistance** command). If the port is not configured in long distance mode, certain systems might reserve buffers for the port. This field then displays the number of buffers reserved for the port.

Buffer Usage

The actual number of buffers allocated to the port. In LD mode, the number is determined by the actual distance and the user-specified desired distance (as defined by the *desired_distance* operand of the **portCfgLongDistance** command).

Needed Buffers

The number of buffers needed to utilize the port at full bandwidth (depending on the port configuration). If the number of **Buffer Usage** is less than the number of **Needed Buffers**, the port is operating in the buffer limited mode.

Link Distance

For L0 (not in long distance mode), the command displays the fixed distance based on port speed, for instance: 10 km (1 Gbps), 5 km (2 Gbps), 2 km (4 Gbps), or 1 km (8 Gbps). For static long distance mode (LE), the fixed distance of 10 km displays. For LD mode, the distance in kilometers displays as measured by timing the return trip of a MARK primitive that is sent and then echoed back to the switch. LD mode supports distances up to 500 km. Distance measurement on a link longer than 500 km might not be accurate. If the connecting port does not support LD mode, is shows "N/A".

Remaining Buffers

The remaining (unallocated and reserved) buffers in a port group.

A hyphen in one of the display fields indicates that no relevant information is available; there may be no connection to a port, or the port is disabled, or the port is not an E_Port.

When invoked without operands, this command displays the long distance buffer information for all the port groups of the switch.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operands are optional:

slot

For bladed systems only, specifies the slot number of the port group to display, followed by a slash (/).

port

Specifies the number of a port associated with the port group, relative to its slot for bladed systems. Use **switchShow** for a list of valid ports.

54

EXAMPLES

To display the port buffer information for a port:

switch	switch:admin> portbuffershow 17							
User	Port	Lx	Max/Resv	Buffer	Needed	Link	Remaining	
Port	Type	Mode	Buffers	Usage	Buffers	Distance	Buffers	
16		-	-	0	-	-		
17	E	L1	_	54	54	50km		
18		-	_	0	_	-		

SEE ALSO portCfgLongDistance

19

portCamShow

Displays port-based filter CAM utilization.

SYNOPSIS portcamshow [slot/]port

DESCRIPTION

Use this command to display the current filter Content-Addressable Memory (CAM) utilization of a specified port.

The command displays the following information:

SID used

Total number of CAM entries used by this port. Note that each CAM entry, either source ID (SID) or destination ID (DID) CAM, can be shared among a certain

number of ports, depending on the ASIC.

DID used

Total number of CAM entries used by this port. Note that each CAM entry (either SID or DID CAM) can be shared among a certain number of ports, depending on the ASIC.

SID entries

All existing source ID entries within the CAM for this port. Note that each CAM entry (either SID or DID CAM) can be shared among a certain number of ports, depending on the ASIC.

DID entries

All existing destination ID entries within the CAM for this port. Note that each CAM entry (either SID or DID CAM) can be among a certain number of ports,

depending on the ASIC.

SID free

The total number of free SID CAM entries available for use by this port.

DID free

The total number of free DID CAM entries available for use by this port.

NOTES

This command cannot be executed on a logical port.

Ports that support shared areas are divided into two ports: primary and secondary ports. Primary and secondary ports share the same area. Port CAM entries displayed on the primary ports also consist of all the secondary port SIDs and DIDs as well, when both the ports are F_Ports. This is because the primary port acts as a proxy for the CAM entries of the secondary port, in this case using redirect filters.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on FCoE ports.

This command cannot be executed on a logical port.

OPERANDS '

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to display, followed

by a slash (/).

port

Specifies the port number to display, relative to its slot for bladed systems. Use

switchShow to list valid ports. This operand is required.

EXAMPLES To display the filter CAM utilization for a single port on a switch:

switch:user> portcamshow 3/2 Area SID used DID used SID entries DID entries 34 3 1 350400 2b2200 2b1200 220400 SID Free, DID Free: (61, 511)

To display port CAM entries on shared ports (in the example, port 7/31 and 7/39 are shared ports and 7/31 is the primary port):

switch:user> portcamshow 7/39									
Area 207	3	DID used 1 034100 03cf00	SID entries 03b380						
SID f	ree, DID f	ree: (2044	, 1020)						
switc	h:admin> p	ortcamshow	7/31						
Area	SID used	DID used	SID entries	DID entries					
207	4	2	03b380	03cf80					
			034100	03cf00					
	03cf00								
	03cf80								
SID f	SID free, DID free: (2044, 1020)								

The SID entry 03cf00 and DID entry 03cf80 on port 7/31 belong to port 7/39.

SEE ALSO switchShow

portCfg

Manages port configuration parameters for FC ports, VE_ports, and GbE/10GbE ports.

SYNOPSIS

portcfq action [slot/] port arguments

portcfg action [slot/] ge_port arguments

portcfg action [slot/]ve_port options arguments

portcfq action [slot/][qe port options arguments

DESCRIPTION

Use this command to manage port configuration parameters on FC ports as well as on Gigabit Ethernet (GbE) ports on the Brocade 7800/FX8-24 and on the Brocade FR4-18i.

You must use this command in a manner that honors the platform-specific differences in command syntax and behavior. Some command options are not available on all platforms. Others behave differently depending on the platform on which they are executed.

Platform specific commands are documented in separate sections that include function, synopsis, description, operands and examples. Use the following section headings to navigate this page.

Commands supported on all platforms

- portcfg mirrorport Configure a mirror port on the local FC port.
- portcfg rscnsupr Manage registered state change notification (RSCN) suppression on the local port.

Commands supported on the Brocade 7800/FX8-24 and the Brocade FR4-18i platforms

- portcfg ipif Configure the local IP interfaces
- portcfg iproute Configure a static route on the IP interface.
- portcfg vlantag Manage the IP interface VLAN configuration for FCIP.

Commands supported only on the Brocade 7800 and the Brocade FX8-24 platforms

- portcfg fciptunnel Create, modify, and delete Fibre Channel over IP (FCIP) tunnels (although this
 command is technically valid on the Brocade FR4-18i as well, the behavior is very different, and the
 command is therefore described separately for each platform).
- portcfg fcipcircuit Create, modify, and delete FCIP circuits.
- portcfg mgmtif Creates the inband management interfaces.
- portcfg mgmtroute Creates the routes for the inband management interfaces.

Commands supported only on the Brocade FR4-18i

- portcfg arp Add and delete address resolution protocol (ARP) entries. Flush ARP table.
- portcfg fciptunnel Create, modify, and delete Fibre Channel over IP (FCIP) tunnels (FCIP) tunnels (although this command is technically valid on the Brocade 7800/FX8-24 platforms as well, the behavior is very different, and the command is therefore described separately for each platform).
- portcfg fastwrite Configure the FC port for FC FastWrite.
- portcfg ficon Manage FICON emulation in an FCIP tunnel.

To display the command usage on the switch, execute **portcfg** action without any further arguments.

NOTES

In Fabric OS v7.0.0 and later, the Brocade FR4-18i and FX8-24 blades cannot co-exist in the same chassis.

IPv6 addresses are supported except for inband management. IPV6 and IPSec cannot co-exist on port XGE1.

In Fabric OS v7.0.0, the restrictions on addressing have been lifted. An IPv4 subnet can span multiple GbE interfaces, and you can now have multiple IPv6 addresses with the same prefix configured on different GbE interfaces on the same extension switch or blade.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Some of the features supported by this command may require a license.

The Fabric OS port configuration commands are not supported on FCoE ports.

FUNCTION Commands supported on all platforms

SYNOPSIS portcfg action [slot/]port arguments

DESCRIPTION

Use this command to configure the following parameters on a local FC port.

- portcfg mirrorport Configure a mirror port on the local port.
- portcfg rscnsupr Manage registered state change notification (RSCN) suppression on the local

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured,

followed by a slash (/).

port[-port]

Specifies a single port or a range of ports, for example, 3-22 or 1/3-8. port ranges

are supported only with the rscnsupr option.

rscnsupr

Manages Registered State Change Notification (RSCN) suppression on the local port. RSCN suppression is configurable only on FC ports. The syntax for portCfg

rscnsupr is as follows:

portcfg rscnsupr [slot/]port[-port] mode

The following modes are supported with the **rscnsupr** option:

--disable

Disables the configuration. When disabled, device changes on the port generate an RSCN to all other end devices that are zoned with this one. By default, RSCN suppression is disabled on all ports.

--enable

Enables the configuration. When enabled, any device changes on the port will not generate an RSCN to any other end device.

mirrorport

Configures a mirror port on the local port. The port mirroring feature reroutes data frames between two devices to the mirror port. Port mirroring can aid in troubleshooting common FC end-to-end communication problems. The command prompts for confirmation that the specified port be enabled as a mirror port. Once a port is configured as a mirror port, the port can only be used as part of a mirror connection. Port Mirroring is not supported over FCIP links (VE tunnels).

The syntax for **portCfg mirrorport** is as follows:

portcfq mirrorport [slot/]port mode

Valid modes for mirrorport include the following:

--disable

Disables the configuration. When disabled, a port cannot be a mirror port.

--enable

Enables the configuration. When the mirror port feature is enabled to a port, a mirror connection can use this port to mirror traffic.

EXAMPLES To enable a mirror port configuration:

```
switch:admin> portcfg mirrorport 2/4 --enable Please confirm enable of Mirror Port (Y,y,N,n):[n] y
```

To configure a range of ports as RSCN-suppressed:

```
switch:admin> portcfg rscnsupr 2/4-7 --enable
```

FUNCTION

Commands supported on the Brocade 7800/FX8-24 and the Brocade FR4-18i platforms

SYNOPSIS

portcfg action [slot/] ge_port arguments

DESCRIPTION

Use this command to configure the local IP interfaces and static routes on the Brocade 7800/FX8-24 and on the Brocade FR4-18i blade. You must configure the local IP interfaces before you can create and configure FCIP tunnels. You can also create a VLAN configuration at the IP interface on the Brocade 7800/FX8-24. The configuration procedures described in this section are essentially the same.

- portcfg ipif Configure the local IP interfaces.
- **portcfg iproute** Configure a static route on the IP interface.
- portcfg vlantag Manage the IP interface VLAN configuration for FCIP.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured, followed by a slash (/).

ge_port

Specifies the number of the GbE port to be configured. The GbE ports are numbered ge0 - ge9 on the Brocade FX8-24 blade and ge0 - ge5 on the Brocade 7800 switch. The two 10GbE ports on the Brocade FX8-24 blade are numbered xge0 and xge1. The two GbE ports on the Brocade FR4-18i are numbered ge0 and ge1. Use the **switchShow** command for a list of valid ports.

ipif

Defines the IP interface for both ports of a tunnel.

On the Brocade 7800 and FX8-24, up to eight IP interfaces per GbE port are supported, but only 4 FCIP circuits can be configured on a single GbE port. Up to 10 IP interfaces and 10 FCIP circuits are supported on the 10GbE port. In Fabric OS v7.0.0 and later, these circuits are not limited to a single 10GbE port. Rather, they can be distributed across both 10GbE ports.

On the Brocade FR4-18i, up to eight IP interfaces per GbE port are supported.

The IP network connection is configured by defining IP interfaces for origin and destination virtual ports, and then defining one or more IP routes to connect them. The syntax for **portCfg ipif** is as follows:

portcfg ipif [slot/]ge_port option args [optional_args]

Valid options and arguments for **ipif** include the following:

create src_ipaddr [netmask] mtu_size

Creates IP interfaces. Specify the following:

src_ipaddr

Specifies source IP address in either IPv6 or IPv4 format:

src_IPv6_addr/prefix_len

Specifies the source IPv6 address of the virtual port if IPv6 is used. The address must be an IPv6 global, unicast address, followed by a prefix. This is used for IPv6 addresses instead of a netmask. The prefix len operator is required. Refer to the Fibre Channel over IP Administrator's Guide for more information on IPv6 rules and restrictions.

src IPv4 addr netmask

Specifies the source IPv4 address of the virtual port, if IPv4 is used. If an IPv4 address is used, the subnet mask must be specified as well (in a.b.c.d. format.)

mtu sizemtu size

Specifies the maximum transmission unit size. The permitted range is 1260 Bytes to 1500 Bytes for the Brocade 7800/FX8-24 platforms and 1260 Bytes to 2348 Bytes for the Brocade FR4-18i. This operand is required.

-x | --crossport

Configures an interface for a failover crossport. A crossport is defined as the nonlocal (secondary) XGE port to a VE_Port group that provides failover capabilities for the tunnel configured on the local XGE port. For VE_Ports 12-21, xge1 is the local XGE port and xge0 is the crossport. For VE Ports 22-31, xge0 is the local XGE port and xge1 is the crossport. This operand is optional and supported only on the Brocade FX8-24 XGE ports.

delete ipaddr

Deletes IP interfaces. Specify the IPv6 or IPv4 address of the virtual port.

iproute

Defines static IP routes on a GbE port or on a 10GbE port. After defining the IP interface on the remote switch, you can define destination routes for an interface. A maximum of 32 user-configurable routes per GbE/10GbE port are supported. You cannot use this command to configure routes for inband management; use portCfg mgmtroute instead. In Fabric OS v7.0.0, you can use this command to configure an iproute for a XGE port configured as a failover crossport. This feature is supported only on the FX8-24.

The syntax for **portcfg iproute** is as follows:

portcfg iproute [slot/]ge_port option args [optional_args]

Valid options and arguments for **iproute** include the following:

create dest_ipaddr [netmask] [gateway_router] metric

Creates an IP route. Specify the following:

dest_ipaddr

Specifies the destination IP address in either IPv6 or IPv4 format:

dest_IPv6_addr/prefix_len

Specifies the destination IPv6 address of the virtual port, if IPv6 is used. The address must be an IPv6 global, unicast address, followed by a prefix. This is used for IPv6 addresses instead of a netmask. The prefix_len operand is required.

2

dest_IPv4_addr netmask

Specifies the destination IPv4 address of the virtual port, if IPv4 is used. If an IPv4 address is used, the subnet mask must be specified as well. Use a.b.c.d. format.

gateway_router

Specifies the IP address of an IP router that can route packets to the destination virtual port IP address. The gateway address must be on the same IP subnet as one of the port IP addresses. This operand is optional with IPv6 addresses. If not specified, the *gateway_router* learned from the Neighbor Discovery protocol is used.

metric

Specifies the link metric associated with the route. Valid values are 0 to 255. The default value is 0. A low value encourages the use of the route, and a high value discourages the use of the route. This operand is valid only on the Brocade FR4-18i blade.

-x | --crossport

Configures an IP route for a failover crossport. A crossport is defined as the nonlocal (secondary) XGE port to a VE_Port group that provides failover capabilities for the tunnel configured on the local XGE port. For VE_Ports 12-21, xge1 is the local XGE port and xge0 is the crossport. For VE_Ports 22-31, xge0 is the local XGE port and xge1 is the crossport. This operand is optional and supported only on the Brocade FX8-24 XGE ports.

delete ipaddr

Deletes IP routes for a specified IPv4 or IPv6 address. Valid *ipaddr* values include the following:

ipaddr

Specifies IP address in either IPv6 or IPv4 format:

IPv6_addr/prefix_len

Specifies the IPv6 address of the virtual port, if IPv6 is used. The address must be an IPv6 global, unicast address, followed by a prefix. The prefix_len operand is required.

dest_IPv4_addr netmask

Specifies the destination IPv4 address of the virtual port, if IPv4 is used. If an IPv4 address is used, the subnet mask must be specified as well. Use a.b.c.d. format.

vlantag

Use this command to maintain the VLAN tag table associated with a particular network interface. This table is mainly used during ingress processing to filter VLAN tagged frames. You can configure multiple VLAN IDs per IP interface; however, if you provide a destination address, there cannot be two entries to the same destination, including 0.0.0.0. Egress frames already marked as VLAN tagged (FCIP circuit-level tagging) take precedence over entries in this table.

This command supports **add** and **delete** options only. To modify a table entry, it must first be deleted, then added with different configuration parameters. The syntax for **portcfg vlantag** is as follows:

portcfg vlantag [slot/]ge_port mode arguments

Valid modes for **vlantag** include the following:

add ipif_addr vlan_id l2cos [dst_ipaddr][optional_args]
Adds an entry to the VLAN tag table.

delete ipif_addr vlan_id [dst_ipaddr]

Deletes an entry from the VLAN tag table. Valid arguments for add and delete include the following:

ipif_addr

Specifies the locally defined interface address in IPv6 or IPv4 format.

vlan_id

Specifies the VLAN ID used for this tag. The range is 1 to 4094.

I2cos

Specifies Layer 2 Class of Service/Priority, as defined in the IEEE 802.1p specification. The range is 0 to 7. Valid only with the **add** option.

dst_ipaddr

Specifies an optional destination IP address (IPv4 or IPv6). All packets destined for this IP address are tagged accordingly. If a destination IP address is not specified, all packets not already tagged will be tagged. The default is 0.0.0.0.

optional_args

Optional VLAN tagging parameters include the following:

-x | --crossport

>Applies the VLAN tag to a crossport interface. Specifying this parameter allows the VE_Ports 12-21 to use the IP interface with this vlantag. This operand is optional and valid only and supported only on the Brocade FX8-24 XGE ports.

-m | --mgmt

Specifying this parameter applies the VLAN tag to the inband management

EXAMPLES To create an IP interface using IPv4:

```
switch:admin> portcfg ipif ge0 create \
     192.168.0.20 255.0.0.0 1500
Operation Succeeded
```

To create an IP interface using IPv6 with a prefix:

switch:admin> portcfg ipif ge0 create 2000::22/64 1500 Operation Succeeded

switch:admin> portshow ipif ge0

Port: ge0

Interface	IPv4	Address	NetMask	Effective	MTU	F	Lag	gs
0	192.	 168.0.20	255.255.255.0	1500		U	 R	M
1	192.	168.0.21	255.255.255.0	1500		IJ	R	М

Interface IPv6 Address			Len	Effective MTU	Flags	
	2	fe80::205:1eff:fec3:e6b2	64	1500	U R M	
	3	2000::20	64	1500	U R M	
	4	2000::21	64	1500	U R M	
	5	2000::22	64	1500	URM	

Flags: U=Up B=Broadcast D=Debug L=Loopback P=Point2Point R=Running N=NoArp PR=Promisc M=Multicast S=StaticArp LU=LinkUp

To create an interface for a failover crossport on a Brocade FX8-24:

1. Configure the interface for the local XGE port (xge0).

```
switch:admin> portcfg ipif 8/xge0 create 192.168.10.20 \
    255.255.255.0 1500
Operation Succeeded
```

2. Configure the interface for the nonlocal XGE port (xge1).

```
switch:admin> portcfg ipif 8/xge1 create 192.168.11.20 \
    255.255.255.0 1500 -x
Operation Succeeded
```

3. The IP address 192.168.11.20 will be available for circuits on VE_Ports 22-31. The output from **portshow ipif** for the same address shows the crossport tag.

```
switch:admin> portshow ipif 8/xge0
Port: 8/xge0
Interface IPv4 Address NetMask Effective MTU Flags
------
0 192.168.10.20 255.255.255.0 1500 U R M
3 192.168.11.20 255.255.255.0 1500 U R M (crossport)
```

To delete an IP interface:

```
switch:admin> portcfg ipif ge0 delete 192.168.10.20
Operation Succeeded
```

To delete an IP interface for a failover crossport:

```
switch:admin> portcfg ipif 8/xge0 delete 192.168.11.20 -x
Operation Succeeded
```

To create a static IP route using an IPv4 destination address, a netmask, and a gateway address:

```
switch:admin> portcfg iproute ge0 create \
    192.42.0.0 255.255.255.0 192.168.0.250
Operation Succeeded
```

To create a static IP route using IPv6:

```
switch:admin> portcfg iproute ge0 create \
    2010::/64 2000::1:250
Operation Succeeded
```

switch:admin> portshow iproute ge0

Port: ge0 IP Address Mask Gateway Metric Flags ______

Flags: U=Usable G=Gateway H=Host C=Created(Interface) S=Static L=LinkLayer(Arp)

To create an IP route for a failover crossport on a Brocade FX8-24:

1. Configure the iproute for the local XGE port (xge0).

```
switch:admin> portcfg iproute 8/xge0 create 2.2.2.0 \
     255.255.255.0 192.168.11.250
Operation Succeeded
```

2. Configure the interface for the nonlocal XGE port (xge1).

```
switch:admin> portcfg ipif 8/xgel create 1.1.1.0 \
    255.255.255.0 192.168.11.250 -x
Operation Succeeded
```

3. The IP route will be available for circuits on VE ports 22-31. The output from portshow iproute for the same route shows the crossport tag.

```
switch:admin> portshow iproute 8/xge0
```

```

192.168.11.0 255.255.255.0 * 0 U C (crossport)
192.168.11.250 255.255.255.255 *
                                      0 U H L (crossport)
```

To delete the crossport IP route:

```
switch:admin> portcfg iproute 8/xgel delete \
     1.1.1.0 255.255.255.0 -x
Operation Succeeded
```

To delete a static IP route using an IPv4 address:

```
switch:admin> portcfg iproute ge0 delete \
     172.16.0.0 255.255.0.0
Operation Succeeded
```

To create a network-wide permanent VLAN tag entry with a VLAN ID of 200 and an L2 CoS value of 5 (no destination address):

```
switch:admin> portcfg vlantag ge2 add \
    192.168.2.10 200 5
Operation Succeeded
```

To display the VLAN tag configuration (for an explanation of the flags, refer to **portShow**):

switch:admin> portshow vlantag ge2

Port: ge2 Interface Address	S	VlanId	L2CoS	Flags
	Destination Address			
192.168.2.10	0.000	200	5	Perm Net
192.168.0.20	0.0.0.0	100	0	Perm
192.168.0.21	192.168.0.10	200	0	Perm
2000::20	192.168.0.11	300	0	Perm
2000::21	2000::10	400	0	Perm
2000::11				

To create a VLAN tag entry for a failover crossport interface with a VLAN ID of 200 and an L2 CoS value of 1 and to display the configuration:

```
switch:admin> portcfg vlantag 8/xge0 add 192.168.11.20 200 1 -x
Operation Succeeded
switch:admin> portshow vlantag 8/xge0
Port: 8/xge0
Interface Address

Destination Address

192.168.11.20

200 1 Perm Net (crossport)
0.0.0.0
```

To delete a VLAN tag entry:

```
switch:admin> portcfg vlantag ge2 delete 192.168.2.10 200
Operation Succeeded
```

To delete a VLAN tag entry for a crossport:

FUNCTION

Commands supported only on the Brocade 7800 and the Brocade FX8-24 platforms

SYNOPSIS

portcfg action [slot/]ve_port options arguments

DESCRIPTION

Use this command to configure FCIP tunnels and FCIP circuits on the GbE/10GbE ports on the Brocade 7800 and FX8-24 platforms only and to configure the inband management on these platforms. The FCIP tunnels on the local and remote GbE ports act as Virtual E_Ports (VE_Ports) connecting the local and remote fabrics. The following operations can be performed with this command:

- portcfg fciptunnel Create, modify, and delete Fibre Channel over IP (FCIP) tunnels.
 - Configure a tunnel with the FCIP FastWrite feature.
 - Enable or disable Tape Pipelining.
 - Configure the compression options.
 - Configure an IPSec-enabled tunnel.

- Configure VLAN tagging on the default FCIP circuit.
- Configure Differentiated Services Code Point (DSCP) markings.
- Set the committed rate or minimum and maximum rates for the default circuit.
- Configure a tunnel for FICON emulation.
- portcfg fcipcircuit Create, modify, and delete additional FCIP circuits.
 - Set or modify the committed rate or minimum and maximum rates for the circuit.
 - Configure or change VLAN tagging on the default circuit.
 - Set or modify additional circuit parameters.
- portcfg mgmtif Configure the inband management interfaces.
- portcfg mgmtroute Configure the routes for the inband management interfaces.

NOTES

You can configure up to 20 FCIP tunnels on the Brocade FX8-24 and up to 8 tunnels on the Brocade 7800.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured, followed by a slash (/).

ve_port

Specifies the number of the VE_Port associated with the tunnel configured on one of the GbE/10GbE ports to be configured. The VE_Ports are numbered 16-23 on the Brocade 7800.

fciptunnel

Creates, modifies, or deletes a Fibre Channel over IP (FCIP) tunnel.

Note the following port mapping rules on the Brocade FX8-24: The Brocade FX8-24 has two FCIP chips and each one controls specific GbE ports and VE ports. The first FCIP chip controls VE_Ports 12-21, and the GbE ports ge0-ge9 and the local XGE port, xge1. The second FCIP chip controls VE_Ports 22-31 and the local XGE port, xge0. Typically (that is in the case when you do not configure a failover crossport) you use the IP addresses on ge0-ge9 and xge1 for any FCIP circuits that use VE_Ports 12-21. And likewise, you use IP addresses on xge0 for any FCIP circuits that use VE_Ports 22-31. When you configure a failover crossport, the VE_Ports on one chip are allowed to use the IP addresses on the non-local chip's XGE port (crossport).

The syntax for **portcfg** fciptunnel is as follows:

portcfg fciptunnel [slot/]ve_port options [tunnel_arguments] [circuit_arguments]

The following *options* are supported with **fciptunnel**:

create [tunnel_arguments][circuit_arguments]

Creates an FCIP tunnel and, optionally a single default circuit. If no circuit arguments are specified, no FCIP circuit will be created. While it is possible to create a tunnel without a default circuit, it is an unlikely scenario (for example, for configuration staging purposes). In most cases, you will create a tunnel with at least one configured FCIP circuit. In this case, you must specify a remote and local IP address for the circuit as well as a committed rate (or alternately, a minimum and maximum committed rate) to configure the default circuit. The default circuit created with the tunnel is automatically assigned the circuit ID 0. You can modify the default circuit with the fciptunnel modify command. To add additional circuits to an existing tunnel, use the fcipcircuit create command.

modify [tunnel_arguments][circuit_arguments]

Modifies the properties of an existing FCIP tunnel. To modify a tunnel, you must specify at least one of the tunnel or circuit parameters for the command to be effective. Any circuit attribute you change with the **fciptunnel modify** command affects only the FCIP circuit 0. All other circuits remain unchanged. To modify a circuit other than circuit 0, you must use the **fcipcircuit modify** command.

In order to create a default circuit 0 with the tunnel, you must at least specify the following circuit arguments with **fciptunnel create**:

remote_ip_address

Specifies the IP address for the remote end of the FCIP circuit.

local_ip_address

Specifies the IP address for the local end of the FCIP circuit.

The following two operands are exclusive; you can either specify a committed rate or a minimum and maximum rate for circuit 0. You can modify these parameters later with **fciptunnel modify**.

comm rate

Specifies the committed traffic rate on the FCIP tunnel in Kbps. The valid range is 10,000 Kbps to 1,000,000 Kbps for 1G ports and 10,000 Kbps to 10,000,000 Kbps for 10G ports. There is no default. Both sides of the circuit must have matching configurations.

-b | --min-comm-rate value, -B | --max-comm-rate value

Alternately you may set a minimum and a maximum for the committed rate to configure the tunnel for Adaptive Rate Limiting (ARL), which allows for a more effective sharing of bandwidth between applications. The valid range is 10,000 Kbps to 1,000,000 Kbps for 1G ports and 10,000 Kbps to 10,000,000 Kbps for 10G ports. The maximum committed rate is the combined maximum committed rate of all configured circuits and it can be no larger than five times the minimum committed rate. Both sides of the circuit must have matching configurations.

Beginning with Fabric OS v7.0, you can configure minimum and maximum rates for each circuit of a tunnel using the XGE ports on the FX8-24 blade. This provides a maximum guaranteed rate of 10Gbps combined for all tunnels over a single 10GbE port and a maximum rate of 10Gbps for any single circuit. This feature is backwards compatible with 1GbE ports on either the Brocade 7800 Extension Switch or on the Brocade FX8-24 Extension Blade. For connections between 10GbE ports, ARL is supported only if Fabric OS v7.0 is running on both switches.

Optional *tunnel_arguments* for **fciptunnel create** and **modify** include the following. Tunnel parameters are by default disabled. To change the default (for example, enabling FastWrite) with **fciptunnel create**, specify the parameter only. To modify any of these parameters with **fciptunnel modify**, specify the parameter and one of the values in square brackets.

-f | --fastwrite [0 |1]

Disables (0) or enables (1) FCIP FastWrite on the specified FCIP tunnel.

-t | --tape-pipelining [0-2]

Configures Open Systems Tape Pipelining on the specified FCIP tunnel. By default, OSTP is disabled (0).

When using this operand with **fciptunnel create**, specify one or more of the following operands:

-t | --tape-pipelining

Enables write-read Tape Pipelining (FCIP FastWrite must also be enabled.)

-N | --no-read-pipelining

Disables tape read-pipelining. This operand is valid only with fciptunnel create and -t must be specified enabling the feature. The combination of -t and -N effectively enables tape write-pipelining.

When using this operand with fciptunnel modify, specify one or more of the following:

-t | --tape-pipelining mode

Modifies the Open System Tape Pipelining configuration. Specify one of the following modes:

0

Disables Tape Pipelining

1

Enables write-read Tape Pipelining (FCIP FastWrite must also be enabled).

2

Enables write-only Tape Pipelining (FCIP FastWrite must also be enabled).

-c | --compression compression_level

Configures compression on the specified FCIP tunnel. By default, compression is disabled (0). Specify one of the following values:

0

Compression disabled

1

Standard compression

2

Moderate compression

3

Aggressive compression

Auto compression. Automatically adjusts compression level based on the maximum configured tunnel bandwidth. The To enable this feature you must upgrade both ends of the tunnel to Fabric OS v7.0.0. Based on total effective tunnel bandwidth, the compression level will be adjusted as follows:

Aggressive

Bandwidth less than 512 Mbps

Moderate

Bandwidth more than 512 Mbps and less than 2 Gbps.

Standard

Bandwidth more than 2Gbps.

-T | --tperf [0|1]

Disables (0) or enables (1) TPerf test mode. Refer to portCmd help for more information regarding TPerf monitoring.

-n | --remote-wwn remote-wwn

Specifies the WWN of the remote FC entity.

-d | --description string

Specifies a description for the specified tunnel.

-i | --ipsec [0|1]

Disables (0) or enables (1) Internet Protocol Security (IPSec) on the specified tunnel. Circuits that fall underneath a tunnel inherit the IPSec tunnel attributes. IPSec uses a predefined policy with IKEv2 for key negotiation, ESP transport mode for IPSec, and AES with 256-bit keys for Encryption (AES-GCM-ESP). You must specify a key with this option. On the Brocade FX8-24, IPSec is supported only on VE_Ports 12-21.

-K | --key preshared_key

Specifies the preshared key to be used for authentication. Specify a string of alphanumeric characters 32 bytes in length. This argument must be used together with **--ipsec**.

-I | --legacy [0|1]

In Fabric OS v7.0.0, the connection process for FCIP tunnels has changed in ways that make it incompatible with earlier firmware versions. Specifying the **--legacy** allows connection to IPSec-configured tunnels that use pre-Fabric OS v7.0.0 firmware versions. You enable or disable this option per tunnel. This option is a disruptive modify request that causes the tunnel to bounce. The command prompts for confirmation with an appropriate message.

-q | --qos high, med, low

Sets QoS percentages for all QoS priorities. The default values are 50% (high), 30% (medium), and 20% (low). Each priority can have a minimum of 10%, the high must be greater than or equal to the medium, and the medium must be greater than or equal to the low. The sum of percentages must equal 100%. Both ends of the tunnel must have the same QoS priority settings and the switches must run Fabric OS v7.0.0.

Use the following operands to modify individual settings.

-- gos-high percentage

Specifies the percentage for the high priority.

-- qos-medium percentage

Specifies the percentage for the medium priority.

--qos-low percentage

Specifies the percentage for the high priority.

-F | --ficon [0|1]

Enables (1) or disables (0) FICON emulation on the specified FCIP tunnel. Optional FICON arguments for **fciptunnel create** allow you to control specific features. Use the [0|1] options only with **fciptunnel modify**.

--ficon-tera-read [0|1]

Enables (1) or disables (0) FICON Read Emulation for a Teradata server on the specified FCIP tunnel.

--ficon-tera-write [0|1]

Enables (1) or disables (0) FICON Write Emulation for a Teradata server on the specified FCIP tunnel.

--ficon-xrc [0|1]

Enables (1) or disables (0) FICON XRC emulation. FICON XRC Emulation allows XRC (IBM eXtendedRemote Copy, also known as IBM z/OS Global Mirroring) to operate effectively at extended distances.

--ficon-tape-write [0|1]

Enables (1) or disables (0) FICON Tape Write Pipelining. This feature improves the performance of certain applications when writing to tape over extended distances.

--ficon-tape-read [0|1]

Enables (1) or disables (0) FICON Tape Read Pipelining. This feature improves performance for certain applications when reading from FICON tape over extended distances.

--ficon-tin-tir [0|1]

Enables (1) or disables (0) FICON TIN/TIR emulation. This feature enhances recovery when a TIN/TIR exchange occurs as part of a channel recovery operation during tape emulation. This feature is enabled by default (recommended setting).

--ficon-dvcack [0|1]

Enables (1) or disables (0) FICON Device Level Acknowledgement emulation. This feature is applicable to both FICON Disk and Tape configurations. The feature removes one network round trip for exchanges that end with a Device Level Acknowledgement frame from the device. This feature is enabled by default (recommended setting).

--ficon-read-blk [0|1]

Enables (1) or disables (0) FICON read Tape Read Block ID emulation. This feature permits FICON write channel programs containing embedded read block ID commands (CCWs) with a byte count of exactly four bytes to be processed as emulated commands during write emulation processes.

--ficon-print [0|1]

Enables (1) or disables (0) FICON printer emulation on the specified FCIP tunnel. This command is valid only with the **modify** option.

--max-read-pipe value

Defines the maximum number of tape read channel commands (CCWs) that can enter the read pipeline for a single device whether all the CCWs are bundled in a single channel program or in multiple channel programs. The setting has significance only for host (channel) initiated operations at this side and will not affect tape write operations initiated by hosts (channels) attached at the opposite side. Too small of a value will result in poor performance. The value should be chosen based upon the typical tape channel program that requires optimum performance. The default value is 32 (recommended setting). The range is 1 to 100.

--max-write-pipe value

Defines the maximum number of tape write channel commands (CCWs) that can enter the write pipeline for a single device whether all the CCWs are bundled in a single channel program or in multiple channel programs. The setting has significance only for host (channel) initiated operations at this side and will not affect tape write operations initiated by hosts (channels) attached at the opposite side. Too small of a value will result in poor performance. The value should be chosen based upon the typical tape channel program that requires optimum performance. The default value is 32 (recommended setting). The range is 1 to 100.

--max-read-devs value

Defines the maximum number of concurrent emulated tape read operations. As concurrency increases, the value of emulation decreases. Excessive concurrency has the potential to oversubscribe packet data memory. The setting has significance only for host (channel) initiated operations at this side and will not affect tape read operations initiated by hosts (channels) attached at the opposite side. The default value is 16. The range is 1 to 32.

--max-write-devs value

Defines the maximum number of concurrent emulated tape write operations. As concurrency increases, the value of emulation decreases. Excessive concurrency has the potential to oversubscribe packet data memory. The setting has significance only for host (channel) initiated operations at this side and will not affect tape write operations initiated by hosts (channels) attached The default value is 16. The range is 1 to 32.

--write-timer value

Defines a time limit for pipelined write chains. This value is specified in milliseconds (ms). If a pipelined write chain takes longer than this value to complete, the ending status for the next write chain will be withheld from the channel. This limits processing to what the network and device can support. Too small a value limits pipelining performance. Too large a value results in too much data being accepted for one device on a path. The default value is 300 milliseconds (ms). The range is 100 to 1500.

--write-chain value

Defines the maximum amount of data that can be contained in a single CCW chain. If this value is exceeded, emulation is suspended. The default value is 3.2 MB (3200000 bytes) The range is 1 MB to 5 MB.

--oxid-base value

Defines the base value of an entry pool of 256 OXIDs supplied to emulation-generated exchanges. It should fall outside the range used by FICON channels and devices to avoid conflicts. The default value is 0x8000 (recommended setting). The range is 0x0000 to 0xF000.

--ficon-debug value

Defines optional debug flags. The default value is 0xF7C80000. This parameter is primarily for use by technical support personnel.

Optional FCIP circuit arguments for **fciptunnel create** and **modify** include the following.

-a | --admin-status [0|1]

Enables (1) or disables (0) the circuit. Admin status is disabled by default. Use **-a --admin-status** to enable the feature when you create a circuit. Use **-a |--admin-status 0|1** when you modify a circuit.

-C | --connection-type [0|1|2] | [default|listener|initiator]

Specifies whether the circuit is the listener or the initiator. Values are 0=Default, 1=Listener, and 2=Initiator. You can use either the numeric values or their string equivalents. String values are not case sensitive. In default mode, the initiator and listener are automatically chosen based on the lower and higher-order IP address. This can cause a problem in Network Address Translation (NAT) environments, if both sides of the circuit have lower-order addresses. This option is a disruptive modify request that causes the tunnel to bounce. The command prompts for confirmation with an appropriate message.

-s | --sack 0|1

Disables (0) or enables (1) selective acknowledgement code (SACK) on the FCIP circuit. SACK is enabled by default. Use -s | --sack to disable the feature when you create a circuit. Use -s | --sack $0 \mid 1$ to disable or enable SACK when you modify a circuit.

-k | --keepalive-timeout timeout

Specifies the keep alive timeout in milliseconds. The valid range is 500 ms to 720000 ms. If the tunnel does not already have FICON Emulation enabled. circuits created on the tunnel default to 10000 ms (10 seconds) for the FCIP Trunking keep alive timeout. If FICON emulation is enabled on the FCIP Tunnel when a circuit is created, the keep alive timeout defaults to 1000 ms (1 seconds).

-x | --metric metric

Specifies the metric for the configured circuit. The valid range is 0 to 1. The default value is 0. A lower metric assigns a higher priority to the circuit. As data is flowing through the FCIP tunnel, it automatically traverses the lowest metric cost circuits. For example, if a tunnel has four circuits, three of which are set to a metric of 0 and one is set to a metric of 1, all data will flow over the metric 0 circuits. If all of the metric 0 circuits go down, traffic will run over the metric 1 circuits. This parameter is meaningful only, if you configure more than one circuit.

-m | --min-retrans-time time

Specifies the minimum time interval in milliseconds between retransmits. The valid range is 20 ms to 5000 ms. The default value is 100 ms.

-r | --max-retransmits retransmissions

Specifies the maximum number of retransmissions. The valid range is 1 to 16. The default value is 8.

-v | --vlan-tagging vlan id

Creates an FCIP tunnel with VLAN Tagging and Class of Service (CoS). Specify a *vlan_id* in the range between 1 and 4094. If any other VLAN option is specified, the VLAN ID must also be specified. Refer to the IEEE 802.1p specification for more information.

You can configure VLAN tags when you create a circuit or after the fact by modifying a circuit. Note that adding or modifying the VLAN configuration after a circuit has been created is a disruptive operation.

You may also specify VLAN tagging per IP interface with the portCfg vlantag command. The VLAN configuration at the IP interface level is for non-data path traffic only. If the data path traffic is to be tagged, it must be done through the VLAN tagging option with the **fcipcircuit create** or **modify** command. Note that the circuit VLAN configuration takes priority over the IP interface VLAN configuration.

The following operands are optional with VLAN tagging

-- I2cos-f-class /2cos

Specifies the Layer 2 Class of Service (L2CoS) value for F-Class Traffic. This priority setting controls connections between switches. The range is 0 to 7. The default is 0.

-- l2cos-high /2cos

Specifies the L2CoS value for High Priority Traffic. The range is 0 to 7. The default is 0.

-- I2cos-medium /2cos

Specifies the L2CoS value for Medium Priority Traffic. The range is 0 to 7. The default is 0.

-- l2cos-low /2cos

Specifies the L2CoS value for Low Priority Traffic. The range is 0 to7. The default is 0.

--dscp-f-class dscp

Specifies the DSCP value for F-Class Traffic. The range is 0 to 63. The default value is 0.

--dscp-high dscp

Specifies the DSCP value for High Priority. The range is 0 to 63. The default value is 0.

--dscp-medium dscp

Specifies the DSCP value for Medium Priority. The range is 0 to 63. The default value is 0.

--dscp-low dscp

Specifies he DSCP value for Low Priority. The range is 0 to 63. The default value is 0.

delete tunnel_ID

Deletes the specified FCIP tunnel. This command deletes all associated circuits created with the **fciptunnel** or **fcipcircuit** commands. Use the **portShow** command to display all FCIP tunnels and their associated circuits.:

fcipcircuit

Creates an FCIP circuit on an existing tunnel. Use this command to configure additional circuits. The circuit-specific parameters are optional. The syntax for **portcfg fcipcircuit** is as follows:

portcfg fcipcircuit [slot/]ve_port option circuit_ID options [arguments]
[optional_arguments]

The following options and arguments are supported with **fcipcircuit**:

create circuit_ID remote_ip_addr local_ip_addr comm_rate [circuit_arguments]

Creates an FCIP circuit. You must specify the following parameters when creating an additional circuit:

circuit_ID

Specifies a numeric identifier for the circuit. The circuit ID is an integer value between 0-9 for both the Brocade FX8-24 and the Brocade 7800.

remote_ip_addr

Specifies the IP address for the remote end of the FCIP circuit.

local_ip_addr

Specifies the IP address for the local end of the FCIP circuit.

The following two operands are mutually exclusive:

comm_rate

Specifies the committed traffic rate on the FCIP tunnel in Kbps. The valid range is 10,000 Kbps to 1,000,000 Kbps for 1G ports and 10,000 Kbps to 10,000,000 Kbps for 10G ports. There is no default. Both sides of the tunnel must have matching configurations.

-b | --min-comm-rate value -B | --max-comm-rate value

Alternately you can set a minimum and a maximum for the committed rate to configure the tunnel for Adaptive Rate Limiting (ARL), which allows for a more effective sharing of bandwidth between applications. The valid range is 10,000 Kbps to 10,000 Kbps for 1G ports and 1,000,000 Kbps to 10,000,000 Kbps for 10G ports. The maximum committed rate can be no larger than five times the minimum committed rate, and both sides of the circuit must have matching configurations.

modify [circuit_ID] [circuit_arguments

Modifies the properties of an existing FCIP circuit. To modify a circuit, you must specify at least one of the optional circuit parameters for the command to be effective. Any circuit attribute you change with the fcipcircuit modify command affects only the specified FCIP circuit. All other circuits remain unchanged.

Refer to **fciptunnel create** and **modify** for a listing of optional circuit arguments and their descriptions.

delete circuit_ID

Deletes the specified FCIP circuit.

mgmtif

Configures an inband management interface. A maximum of one interface is supported per GbE Port. Up to a total of 6 management interfaces are supported for the Brocade 7800 and up to a total of 11 interfaces for the Brocade FX8-24 (depending on blade operating mode). The interfaces must each exist on a unique network, separate from the other inband management interfaces and from all other interfaces on the CP. The syntax for **mgmtif** is as follows:

mgmtif ge_port [options] arguments

Valid options and arguments for **mgmtif** include the following:

create

Creates a specified IP Address for the inband management interface. The IP address must be unique.

IPv4_address

Specifies an IP address for the inband management interface in IPv4 format, followed by the subnet mask.

netmask

Specifies the subnet mask for the IPv4 address in a.b.c.d format.

MTU

Specifies the MTU for the inband management interface. The valid range is 1260 to 1500. This operand is optional.

delete

Deletes the specified IP Address for the inband management interface.

IPv4_address

Specifies the IP address to be deleted.

disable

Disables the inband management interface at the specified GbE Port.

enable

Re-enables the inband management interface at the specified GbE Port after it has been disabled. The interface is by default enabled when it is created.

mgmtroute

Configures the management route for the inband management interface (needed only if the management interfaces are on different subnets). The syntax for mgmtroute is as follows:

mgmtroute ge_port [options] destination_ip_address

Valid options and arguments for **mgmtroute** include the following:

create

Creates a management route for a specified destination IP Address. The following operands are required:

dest_IPv4_addr

Specifies the destination IP address for the management route in IPv4

format.

netmask

Specifies the subnet mask for the IPv4 address in a.b.c.d format.

gateway

Specifies the IP address of an IP router that can route packets to the

destination IP address.

delete

Deletes a management route for a specified destination IP Address. The following operands are required.

dest_IPv4_addr

Specifies the destination IP address for the management route in IPv4

format.

netmask

Specifies the subnet mask for the IPv4 address in a.b.c.d format.

EXAMPLES

To create a FICON-enabled tunnel, first create an empty FCIP tunnel without any circuits:

```
switch:admin> portcfg fciptunnel 1/12 create
Operation succeeded
```

To enable FICON and compression on the tunnel (this sets the keepalive timeout value to 1000 ms, which is the default for DFICON-enabled tunnels):

```
switch:admin> portcfg fciptunnel 1/12 \mod fy -c \ 1 -F \ 1 Operation succeeded
```

To create two circuits (circuit 0 and circuit 1) on the tunnel (these circuits will be created with the FICON-compatible keepalive timeout value):

```
switch:admin> portcfg fcipcircuit 1/12 create \
    0 192.168.51.61 192.168.50.68 -b 300000 -B 500000
Operation succeeded

switch:admin> portcfg fcipcircuit 1/12 create
    1 192.168.50.61 192.168.51.68 -b 300000 -B 500000
Operation succeeded
```

To display circuit 1:

```
SACK: On
          Min Retrans Time: 100
          Max Retransmits: 8
          Keepalive Timeout: 1000
          Path MTU Disc: 0
          VLAN ID: (Not Configured)
          L2CoS: (VLAN Not Configured)
          DSCP: F: 0 H: 0 M: 0 L: 0
          Flags: 0x00000000
To set the compression rate to 'moderate' on the tunnel:
   switch:admin> portcfg fciptunnel 1/12 modify -c 2
   Operation succeeded
To enable FICON XRC and Teradata emulation on the tunnel:
    switch:admin> portcfg fciptunnel 1/12 modify \
         --ficon-xrc 1 --ficon-tera-read 1 --ficon-tera-write 1
   Operation succeeded
To enable printer emulation on the tunnel:
    switch:admin> portcfg fciptunnel 1/12 modify \
         --ficon-print 1
   Operation succeeded
To configure FCIP FastWrite and Tape Pipelining on the tunnel:
    switch:admin> portcfg fciptunnel 1/12 modify -f 1 -t 1
   Operation succeeded
To delete circuit 1:
   switch:admin> portcfg fcipcircuit 1/12 delete 1
   Operation succeeded
To create a tunnel with VLAN tagging:
1. Create a tunnel with VLAN tagging set.
   switch:admin> portcfg fciptunnel 16 create \
         192.168.2.20 192.168.2.10 2500000 -v 100
   Operation Succeeded
2. Create a circuit with VLAN tagging set.
   switch:admin> portcfg fcipcircuit 16 create 1 \
         192.168.2.21 192.168.2.11 2500000 -v 200
   Operation Succeeded
3. Modify an existing circuit to change the VLAN tag and L2 CoS levels.
   switch:admin> portcfg fcipcircuit 16 modify \
         0 -v 300 --12cos-f 7 --12cos-h 5 \
         --12cos-m 3 --12cos-l 1
    !!!! WARNING !!!!
   Modify operation can disrupt the traffic on the
   fcipcircuit specified for a brief period of time. This
```

operation will bring the existing circuit down (if circuit is up) before applying new configuration. Continue with Modification (Y,y,N,n): [n] ${\bf y}$ Operation Succeeded

4. Modify existing circuit to change DSCP marking values

```
switch:admin> portcfg fcipcircuit 16 modify 0 \
     --dscp-f 32 --dscp-h 16 --dscp-m 8 --dscp-l 4
Operation Succeeded
```

5. Display the tunnel configuration and circuit values.

```
switch:admin> portshow fciptunnel 16 -c
Tunnel ID: 16
  Tunnel Description:
  Admin Status: Enabled
  Oper Status: In Progress
  Compression: Off

```

To modify an existing circuit so it becomes the listener:

```
switch:admin> portcfg fcipcircuit 16 modify 2 -C 1
!!!! WARNING !!!!
Modify operation can disrupt the traffic on the fcipcircuit specified \setminus
for a brief period of time. This operation will bring the existing \setminus
circuit down (if circuit is up) before applying new configuration.
Continue with Modification (Y,y,N,n): [ n]\mathbf{y}
Operation Succeeded
```

To modify an existing circuit so it becomes the initiator (the following example uses the string option):

```
switch:admin> portcfg fcipcircuit 16 \
       modify 2 --connection-type initiator
!!!! WARNING !!!!
Modify operation can disrupt the traffic on the fcipcircuit specified \
for a brief period of time. This operation will bring the existing \setminus
circuit down (if circuit is up) before applying new configuration.
Continue with Modification (Y,y,N,n): [ n]\mathbf{y}
Operation Succeeded
```

To configure an IPSec-enabled tunnel to connect with an IPSec-configured tunnel in legacy mode:

```
switch:admin> portcfg fciptunnel 8/12 modify --legacy 1
!!!! WARNING !!!!
Modify operation can disrupt the traffic on the fciptunnel specified \
for a brief period of time. This operation will bring the existing \
tunnel down (if tunnel is up) before applying new configuration.
Continue with Modification (Y,y,N,n): [ n]y
Tunnel 8/12 modify: Operation Succeeded
```

To create inband management interfaces for two Brocade 7800 switches on the same subnet:

1. Configure each switch.

```
switch:admin> portcfg mgmtif ge0 create 192.168.3.10 255.255.255.0
switch:admin> portcfg mgmtif ge0 create 192.168.3.20 255.255.255.0
```

2. Access the switch through the external inband management interface.

```
linux# telnet 192.168.3.10
```

To create inband management interfaces for two Brocade 7800 switches on different subnets connected by two routers:

1. Configure the inband management interfaces on the first switch.

```
switch:admin> portcfg mgmtif ge0 create 192.168.1.10 255.255.255.0
```

2. Configure the inband management route for the management station.

```
switch:admin> portcfg mgmtroute ge0 create 192.168.3.0 \
255.255.255.0 192.168.1.250
```

3. Configure the inband management interfaces on the second switch.

```
switch:admin> portcfg mgmtif ge0 create 192.168.2.20 255.255.255.0
```

4. Configure the inband management route for the management station.

```
switch:admin> portcfg mgmtroute ge0 create 192.168.3.0 \
255.255.255.0 192.168.2.250
```

5. On the Management Station, add route entries to get to the Brocade 7800 external inband management interfaces.

```
linux# route add 192.168.1.0 netmask 255.255.255.0 gw 192.168.3.250 linux# route add 192.168.2.0 netmask 255.255.255.0 gw 192.168.3.250
```

6. Access the 7800 switches through the external inband management interfaces.

```
linux# telnet 192.168.1.10
```

To delete an inband management interface:

```
switch:admin> portcfg mgmtif ge0
     delete 192.168.3.10 255.255.255.0
```

To delete a management route:

```
switch:admin> portcfg mgmtroute ge0 delete 192.168.3.0 255.255.255.0 192.168.2.250
```

To disable and re-enable an inband management interface:

```
switch:admin> portcfg mgmtif ge0 disable
switch:admin> portcfg mgmtif ge0 enable.
```

To configure a VLAN tag for an inband management port:

```
\label{eq:switch:admin} switch: admin> \mbox{portcfg vlantag 10/xge0 add 172.16.30.40 30 0 --mgmt} \\ Operation Succeeded
```

switch:admin> portshow vlantag all

Port: 10/xge0 Interface Address	Destination Address	VlanId	L2CoS	Flags
172.16.30.80		30	0	Perm
172.16.30.40	172.16.50.80	30	0	Perm Net Mgmt
	0.0.0.0			

FUNCTION Commands supported only on the Brocade FR4-18i blade.

SYNOPSIS portcfg action [slot/]ge_port [if_action] arguments

DESCRIPTION

Use this command to manage configuration parameters for ports and Gigabit Ethernet (GbE) ports on the Brocade FR4-18i FC blade. The following commands are exclusive to this blade.

- portcfg arp Add and delete address resolution protocol (ARP) entries. Flush ARP table.
- portcfg fciptunnel Create, modify, and delete Fibre Channel over IP (FCIP) tunnels.
 - Delete, reset, and modify QoS mappings on an existing tunnel.
 - Create or modify a tunnel with VLAN tagging and Class of Service (CoS).
 - Create or modify a tunnel with Tape read/write Pipelining enabled or disabled.
 - Create or modify a tunnel with Byte Streaming enabled or disabled.
- portcfg fastwrite Configure the FC port for FC FastWrite.
- portcfg ficon Manage FICON emulation in an FCIP tunnel.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured, followed by a slash (/).

ge_port

Specifies the number of the port to be configured, relative to its slot for bladed systems. The GbE ports on the Brocade FR4-18i are numbered ge0 - ge1. Use the switchShow command for a list of valid ports.

arp

Optionally adds entries to the address resolution protocol (ARP) table or deletes entries from ARP table. Can also be used to flush the entire table. The syntax for portcfg arp is as follows:

portcfg arp [slot/][ge]port options arguments

Valid options and arguments for **arp** include the following:

add ipaddr macaddr

Adds a static ARP entry to the ARP table. Specify an IP address and a MAC address for each entry. Use portShow arp with the -Imac option to get the MAC address.

delete ipaddr

Deletes a static ARP entry from the ARP table. Only the IP address must be specified to delete the entry.

flush

Flushes the ARP table. Only dynamic entries can be flushed, static entries cannot be cleared.

fciptunnel

Creates, modifies, or deletes a Fibre Channel over IP (FCIP) tunnel. You can configure up to a maximum of eight FCIP tunnels per GbE port. The syntax for portCfg fciptunnel is as follows:

portcfg fciptunnel [slot/][ge]port options arguments [optional_arguments]

The following options and arguments are supported with **fciptunnel**:

create tunnel_id dest_ipaddr src_ipaddr comm_rate

Creates an FCIP tunnel. You must specify a tunnel ID, destination and source IP address, and committed rate when creating an FCIP tunnel. Other configuration parameters are optional, and can be added later.

tunnel_id

Specifies the FCIP tunnel on the GbE port. Valid values are 0 to 7.

dest_ipaddr

Specifies the IP address for the remote end of the FCIP tunnel.

src_ipaddr

Specifies the IP address for the local end of the FCIP tunnel.

comm_rate

Specifies the committed traffic rate on the FCIP tunnel in Kbps. Valid range is 1,544 to 1,000,000. Specify 0 for an uncommitted tunnel. Uncommitted tunnels compete for bandwidth. Changing *comm_rate* is potentially disruptive.

modify tunnel_id [arguments]

Modifies the properties of an existing FCIP tunnel. This operation disrupts the traffic on the specified FCIP tunnel for a brief period of time. If IPSec is enabled on the FCIP tunnel, the tunnel cannot be modified. To modify the tunnel attributes, you must delete and re-create the tunnel.

delete tunnel_id

Deletes the specified FCIP tunnel.

Optional arguments for **fciptunnel create** and **modify** include the following. Tunnel parameters are by default disabled. To change the default (for example, enabling FastWrite) with **fciptunnel create**, specify the parameter only. To modify any of these parameters with **fciptunnel modify**, specify the parameter and one of the values in square brackets.

-n remote_wwn

Specifies the remote-side FC entity WWN.

-d description

Specifies a descriptor for the FCIP tunnel, for example, "Tunnel 0 to San Jose Office".

-c [0|1]

Disables (0) or enables (1) compression on the specified tunnel. By default, compression is disabled.

-f [0|1]

Disables (0) or enables (1) FCIP FastWrite on the specified tunnel. By default, FCIP FastWrite is disabled.

-t [0|1]

Disables (0) or enables (1) read/write Tape Pipelining on the existing tunnel (requires FCIP FastWrite to be enabled).

-k timeout

Specifies the keep alive timeout, in seconds. Timeout values are 8 to 7,200. The default is 10. If Tape Piplelining is enabled, the minimum supported value is 80.

-M [0|1]

Disables (0) or enables (1) default VC QoS mapping on the specified tunnel. By default VC QoS mapping is disabled. There are two ways of prioritizing network traffic over FCIP tunnels: Differentiated Services Code Point (DSCP) and Layer 2 Class of Service (L2CoS). If the -M option is set, the VC on the FCIP outbound frame is mapped to both a DSCP and L2CoS value. These default values can be modified on a per-FCIP tunnel basis with the fciptunnel gosmap option. The -M option can be turned on or off any time. QoS map settings are unaffected by the -M option.

-q control-dscp

Specifies the DSCP (DiffServ Code Point) marking used for the TCP connection of the FCIP tunnel. This operand is optional. The range is 0 to 63. The default value is 0.

-Q data-dscp

Specifies the DSCP (DiffServ Code Point) marking used for the data TCP connection of the FCIP tunnel. This operand is optional. The range is 0 to 63. The default value is 0.

-m time

Specifies the minimum retransmit time, in milliseconds. The range is 20ms to 5000ms: the default value is 100ms.

-r retransmission

Specifies the maximum retransmissions. Values are 1 to 16. The default value is 8. If Tape Piplelining is enabled, the default value is calculated based on the minimum retransmit time to ensure that the TCP connection does not time out before the host times out. The specified value must be greater than the calculated value.

-s [0|1]

Disables or enables selective acknowledgement code (SACK) on the specified FCIP tunnel. Note that SACK is enabled by default. Use -s to disable the feature when creating a tunnel. Use -s 0 to disable and -s 1 to enable SACK when modifying a tunnel.

-t [0|1]

Disables (0) or enables (1) read/write Tape Piplelining on the specified tunnel (requires FCIP FastWrite to be enabled).

-v vlan_id

Creates an FCIP tunnel with VLAN Tagging and Class of Service (CoS). Specify a *vlan_id* in the range between 1 and 4094. There is no default. If any other VLAN option is specified, the VLAN ID must also be specified.

The following operands are optional with VLAN tagging:

-p Control I2cos

Specifies the L2 Class of Service/Priority for the FCIP control connection as defined in the IEEE 802.1p specification. The range is 0 to 7. The default is 0.

-P /2cos

Specifies the L2 Class of Service/Priority for the FCIP data connection as defined in the IEEE 802.1p specification. The range is 0 to 7. The default is 0.

-ipsec policy

_ID Specifies the Internet Protocol security (IPSec) policy number to be used on the specified tunnel. This option must be used together with -ike and -key.

-ike policy_ID vc_num

Specifies the Internet Key Exchange (IKE) policy number to be used on the specified tunnel. This option must be used together with **-ipsec** and **-key**.

2

-key preshared_key

Specifies the preshared key to be used during IKE authentication. Specify a double-quoted string of alphanumeric characters between 12 and 32 bytes in length. This argument must be used together with **-ike** and **-ipsec**.

NOTE: Only a single IPSec-enabled tunnel can be configured on a port. No other tunnels (IPSec or otherwise) can be configured on the same port. Jumbo frames (packets > 1500 bytes) are not supported on secure tunnels. Only a single route is supported on an interface with a secure tunnel.

-b comm rate

Modifies the committed traffic rate on the FCIP tunnel in Kbps. Valid range is 1,544 to 1,000,000. Specify 0 for an uncommitted tunnel. Uncommitted tunnels compete for bandwidth. Changing the *comm_rate* is potentially disruptive. This operand is valid only with the **fciptunnel modify** command.

qosmap

Modifies (or resets to default), the VC to QoS mapping for a particular FCIP tunnel. This table can be modified at any time without bringing down the tunnel. The FCIP tunnel must be configured with the **fciptunnel create modify -M** option before the actual mapping occurs.

The following operands are supported with the **fciptunnel gosmap** option:

tunnel_id

Specifies the tunnel ID. The valid range is 0 to 7.

-default

Resets or sets the VC QoS map to default values.

-delete

Deletes the associated QoS map configuration file. This command removes the file from the configuration flash memory only. The file is automatically reset to defaults if later used or modified.

vc_num

When modifying the VC QoS map, specifies the virtual channel ID for which the QoS map is modified. Valid values are 0 to 15.

When specifying vc_num , either the **-Q** or the **-P** option or both must be specified.

-Q dscp

Specifies the Differentiated Services Code Point (DSCP) value to be modified. Use the **portShow fciptunnel** ge_port **all -qosmap** command to display current values. Supported range is 0 to 63.

-P /2cos

Specifies the L2 Class Of Service (COS) Tagging value. Use the **portShow fciptunnel** ge_port **all** -**qosmap** command to display current values. Supported range is 0 to 7.

ficon

Use this command to enable or disable FICON emulation in an FCIP tunnel and modify associated parameters on an FCIP tunnel on a VE_Port. A feature key is required to enable any of the FICON emulation processing. The tunnel must be down or disabled to issue and process the FICON commands. The results of this command are persistent. The syntax for **portCfg ficon** is as follows:

portCfg ficon [slot/]Ge_Port tunnel_Id config | delete [FeatArgs] [ParamArgs]

This command has the following operands:

tunnel_ld

Specifies the tunnel ID for the configuration change. The valid range is 0 to 7.

config

Creates or modifies a FICON configuration.

delete

Deletes an existing FICON configuration.

The following optional feature arguments are supported with the config and **delete** options. These configurations are persistent.

-x 1|0

Enables (1) or disables (0) XRC emulation. FICON XRC Emulation allows XRC (IBM eXtendedRemote Copy, also known as IBM z/OS Global Mirroring) to operate effectively at extended distances.

-w 1|0

Enables (1) or disables (0) Tape Write Pipelining. This feature improves the performance of certain applications when writing to tape over extended distances.

-r 1|0

Enables (1) or disables (2) Tape read pipelining. This feature improves performance for certain applications when reading from FICON tape over extended distances.

-t 1|0

Enables or disables TIN/TIR emulation. This feature enhances recovery when a TIN/TIR exchange occurs as part of a channel recovery operation during tape emulation.

-I 1|0

Enables (1) or disables (0) Device Level Acknowledgement emulation. This feature is applicable to both FICON Disk and Tape configurations. The feature removes one network round trip for exchanges that end with a Device Level Acknowledgement frame from the device.

-i 1|0

Enables (1) or disables (0) FICON tape read block ID. This feature permits FICON write channel programs containing embedded read block ID commands (Cadres) with a byte count of exactly four bytes to be processed as emulated commands during write emulation processes.

The following optional parameter-specific arguments are supported with the config and delete options.

-a | --wrtMaxPipe value

Defines the maximum number of tape write channel commands (CCWs) that can enter the write pipeline for a single device whether all the CCWs are bundled in a single channel program or in multiple channel programs. The setting has significance only for host (channel) initiated operations at this side and does not affect tape write operations initiated by hosts (channels) attached at the opposite side. Too small of a value results in poor performance. The value should be chosen based upon the typical tape channel program that requires optimum performance. The default value is 32. The range is 1 to 100.

-b | --rdMaxPipe value

Defines the maximum number of tape read channel commands (CCWs) that can enter the read pipeline for a single device whether all the CCWs are bundled in a single channel program or in multiple channel programs. The setting has significance only for host (channel)initiated operations at this side and does not affect tape write operations initiated by hosts (channels)

attached at the opposite side. Too small of a value results in poor performance. The value should be chosen based upon the typical tape channel program that requires optimum performance. The default value is 32. The range is 1 to 100.

-c | --wrtMaxDevs value

Defines the maximum number of concurrent emulated tape write operations. As concurrency increases, the value of emulation decreases. Excessive concurrency has the potential to oversubscribe packet data memory. The setting has significance only for host (channel) initiated operations at this side and does not affect tape write operations initiated by hosts (channels) attached. The default value is 16. The range is 1 to 32.

-g | --rdMaxDevs value

Defines the maximum number of concurrent emulated tape read operations. As concurrency increases, the value of emulation decreases. Excessive concurrency has the potential to oversubscribe packet data memory. The setting has significance only for host (channel) initiated operations at this side and does not affect tape read operations initiated by hosts (channels) attached at the opposite side. The default value is 16. The range is 1 to 32.

-e | --wrtTimer value

Defines a time limit for pipeline write chains. This value is specified in milliseconds (ms). If a pipeline write chain takes longer than this value to complete, the ending status for the next write chain is withheld from the channel. This limits processing to what the network and device can support. Too small a value limits pipelining performance. Too large a value results in too much data being accepted for one device on a path. The default value is 300 milliseconds (ms). The range is 100 to 1500.

-n | --wrtMaxChains value

Defines the maximum amount of data that can be contained in a single CCW chain. If this value is exceeded, emulation is suspended. The default value is 3 MB (3000000 bytes) The range is 1 MB to 5 MB.

-o | --oxidBase value

Defines the base value of an entry pool of 256 OXIDs supplied to emulation-generated exchanges. It should fall outside the range used by FICO channels and devices to avoid conflicts. The default value is 0x1000. The range is 0x0000 to 0xF000.

-f | --dbgFlags value

Defines optional debug flags. The default is 0xF7C80000. This parameter is primarily for use by technical support personnel.

EXAMPLES To add an ARP entry for an IP address (the second parameter is the MAC address):

```
switch:admin> portcfg arp ge0 add \
     192.168.255.25 00:01:02:03:04:60
Operation Succeeded
```

To create an FCIP tunnel using an IPV4 address:

```
switch:admin> portcfg fciptunnel ge0 create 2 \
    192.168.255.2 192.168.255.20 2500000
Operation Succeeded
```

To create an FCIP tunnel using IPV6:

```
switch:admin> portcfg fciptunnel 8/ge0 create \
    0 4000::1234 2000::800:3333:1234 0
Operation Succeeded
```

To modify the committed rate and turn on compression on an existing FCIP tunnel:

```
switch:admin> portcfg fciptunnel 3/ge0 modify \
     6 -b 1000000-c 1
Operation Succeeded
```

To create an FCIP tunnel with VC QoS mapping (default) turned on:

```
switch:admin> portcfg fciptunnel gel create
     1 192.168.200.109 192.168.200.108 0 -M
```

To modify the default VC QoS map settings for VC 1:

```
switch:admin> portcfg fciptunnel gel qosmap 1 3 -Q 29
switch:admin> portcfg fciptunnel gel qosmap 1 3 -Q 28 -P 7
switch:admin> portcfg fciptunnel ge1 qosmap 1 3 -P 2
```

To return the VC QoS map settings to default values:

```
switch:admin> portcfg fciptunnel gel qosmap 1 -default
```

To create an FCIP tunnel with a minimum retransmission time of 20 ms, a VLAN ID of 100, and an L2 CoS priority setting of 7:

```
switch:admin> portcfg fciptunnel 8/ge0 create \
     1 192.168.10.1 192.168.20.1 0 -m 20 \
     -v 100 -p 3 -P 7
Operation Succeeded
```

To create an FCIP tunnel with FastWrite and read/write Tape Pipelining enabled:

```
switch:admin> portcfg fciptunnel 3/ge0 create 6 \
    10.1.1.44 192.168.131.124 155000 -f -t
```

To enable FCIP FastWrite and read/write Tape Pipelining on an existing tunnel:

```
switch:admin> portcfg fciptunnel gel modify 0 -f 1
```

To create an FCIP tunnel with Byte Streaming enabled:

```
switch:admin> portcfg fciptunnel geo create 1 \
     172.68.100.88 192.168.200.108 0 -f1 -bstr
```

To disable Byte Streaming on an existing tunnel:

```
switch:admin> portcfg fciptunnel ge0 modify 1-bstr 0
```

To configure an FCIP Tunnel 1 with FICON XRC and FICON write Tape Pipelining emulation features enabled using all default parameter arguments:

```
switch:admin> portcfg ficon ge0 1 -x 1 -w 1
```

SEE ALSO configure, portCfgShow, portCmd, portShow, switchShow

portCfgAlpa

Configures the AL_PA offset on a specified port or range of ports.

SYNOPSIS portcfgalpa [slot/]port, mode

DESCRIPTION Use this command to set the Arbitrated Loop Physical Address (AL_PA) offset on a port or a range of

ports to either 0x0 (default) or 0x13.

Changes made by this command are persistent across switch reboots and power cycles.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

The Fabric OS port configuration commands are not supported on FCoE ports.

OPERANDS When invoked without operands, this command displays the usage. The following operands are

supported:

slot

For bladed systems only, specify the slot number of the port to be configured,

followed by a slash (/).

port

Specify the number of the port to be configured, relative to its slot for bladed

systems. Use the switchShow command for a list of valid ports.

mode

Specify a value of 1 to set the AL_PA to 0x13. A value of 0 sets the default AL_PA

to 0x0. This operand is required.

EXAMPLES To configure a port with AL_PA 0x0 (default):

switch:admin> portcfgalpa 1/3 0

To configure a port with AL_PA 0x13:

switch:admin> portcfgalpa 1/3 1

SEE ALSO portCfgShow

portCfgAutoDisable

Manages the port autodisable configuration.

SYNOPSIS

portcfgautodisable --enable [slot/]port[-port]

portcfgautodisable --disable [slot/]port[-port]

portcfgautodisable --add option [slot/]port[-port]

portcfgautodisable --remove option [slot/]port[-port]

portcfgautodisable --addall [s/ot/]port[-port]

portcfgautodisable --removeall [slot/]port[-port]

portcfgautodisable --addexcept option [slot/]port[-port]

portcfgautodisable --show [slot/]port[-port[

portcfgautodisable --help>

DESCRIPTION

Use this command to enable or disable the autodisable feature for a specified port or a range of ports and to manage the configuration. If the ports are already in the requested configuration, no action is taken. If a range of ports is specified, some of which are already in the requested configuration, no action is taken for those ports. All other ports in the specified range are updated. Execution of this command is nondisruptive.

The autodisable feature is by default disabled for all ports.

The port autodisable feature minimizes traffic disruption introduced in some instances of automatic port recovery. When the autodisable flag is set, you can specify the conditions that will prevent the port to reinitialize. Such conditions include loss of sync, loss of signal, OLS, NOS, and LIP. Refer to the operand section for an explanation of these conditions. Note that a link reset does not cause a port autodisable. When a port is in FICON Management Server (FMS) mode, an autodisabled port remains persistently disabled across High Availability (HA) failover. In all cases, you can bring the automatically disabled port back into service using the **portEnable** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on GbE ports, VE_Ports, logical interswitch links (LISLs), or FCoE ports.

OPERANDS

This command has the following operands:

slot

Specifies the slot number on bladed systems, followed by a slash (/).

port[-port]

Specifies a port or a port range, relative to the slot number on bladed systems, for

example, 5/17-29.

--enable

Enables the autodisable feature on the specified ports.

--disable

Disables the autodisable feature on the specified ports.

--add

Specifies one or more trigger conditions that will disable the specified ports. Trigger conditions must be separated by a space, for example, LOSN OLS LIP.

Trigger conditions are case insensitive.

--remove

Removes one or more trigger conditions from the port autodisable configuration.

--addall

Adds all supported trigger conditions to the port autodisable configuration.

--removeall

Removes all supported trigger conditions from the port autodisable configuration. This command removes the triggers only; it does not disable the port autodisable

flag.

--addexcept

Adds all supported trigger conditions to the port autodisable configuration except

the one specified.

--show

Displays the port autodisable configuration.

option

Specify one or more the following options (supported with the --add, --remove,

and --addexcept operands):

LOSN

Loss of Sync

LOSNG

Loss of Signal

OLS

Offline Primitive Sequence

NOS

Not Operational Primitive Sequence

LIP

Loop Initialization Primitive Sequence

EXAMPLES To disable the port autodisable feature on single port:

```
switch:admin> portcfgautodisable --disable 18
switch:admin> portcfgautodisable --show 18
Port Auto Disable: OFF
Configured Option(s): No events configured. Port will
   not be automatically disabled.
```

To enable the port autodisable feature on a single port:

```
switch:admin> portcfgautodisable --enable 18
switch:admin> portcfgautodisable --show 18
Port Auto Disable: ON
Configured Option(s): No events configured. Port will
   not be automatically disabled.
```

To add multiple trigger conditions to the port autodisable configuration on a single port:

```
switch:admin> portcfgautodisable --add losn lip ols 18
switch:admin> portcfgautodisable --show 18
Port Auto Disable: ON
Configured Option(s): LOSN OLS LIP
```

To add all trigger conditions except the LOSN condition:

```
switch:admin> portcfgautodisable --addexcept LOSN 18
switch:admin> portcfgautodisable --show 18
Port Auto Disable: ON
Configured Option(s): LOSG OLS NOS LIP
```

To attempt to enable and configure the port autodisable feature on a port for which the feature is already activated (the configuration is not updated):

```
switch:admin> portcfgautodisable --show 18
Port Auto Disable: ON
Configured Option(s): LOSG OLS NOS LIP
switch:admin> portcfgautodisable --enable 18
Same configuration for port 18
switch:admin> portcfgautodisable --addexcept LOSN 18
Same configuration for port 18
```

To enable the port autodisable feature on a range of ports:

```
switch:admin> portcfgautodisable --enable 0-2
switch:admin> portcfgautodisable --show 0-2
Port Auto Disable: ON
Configured Option(s):No events configured.
Port will not be automatically disabled.
Port Auto Disable: ON
Configured Option(s):No events configured.
Port will not be automatically disabled.
Port Auto Disable: ON
Configured Option(s):No events configured.
Port will not be automatically disabled.
```

To enable the port autodisable feature for a range of ports, some of which were previously enabled (the configuration is applied only to those ports, for which an update is necessary, that is, port 3 in the following example):

```
switch:admin> portcfgautodisable --enable 0-3
Same configuration for port 0
Same configuration for port 1
Same configuration for port 2
```

SEE ALSO portCfgShow, portEnable

portCfgCompress

Configures a port for compression.

SYNOPSIS portcfgcompress --enable [slot]/port

portcfgcompress --disable [slot]/port

portcfgcompress --help

DESCRIPTION

Use this command to configure a port for compression. This command enables or disables the compression configuration on the specified port, and saves the configuration persistently.

Configuring a port for compression is disruptive. You must disable the port before you can enable compression on the port. This command fails on an enabled port.

The number of configurable ports is limited per ASIC. Use the **portEncCompShow** for a listing of configurable ports per ASIC.

NOTES

This command is supported only on E_Ports. An E_Port can be enabled for compression and for encryption at the same time.

When you move a configured port to another logical switch, you are informed that the operation requires the port configuration to be disabled. You are given the choice to cancel the move or to continue. If you want to go ahead with the move and the port is configured for encryption or compression, you must disable the configuration prior to moving the port. You must reconfigure the port on the target switch if you want to use compression or encryption on that port.

This command is supported only on Condor 3-based platforms running Fabric OS v7.0.0 or later with the exception of the Brocade 6505 switch and the Brocade FC8-32E and Brocade FC8-48E port blades.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be configured,

followed by a slash (/).

port

Specifies the port to be configured.

--enable

Enables the compression configuration on the specified port.

--disable

Disables the compression configuration on the specified port.

--help

Displays the command usage.

EXAMPLES

To enable the compression configuration:

switch:admin> portcfgcompress --enable 2

```
switch:admin> lscfg --config 15 -port 2
This operation requires that the affected ports be disabled.
Would you like to continue [y/n]?: y
Checking for cap port 2
After Checking for cap port 2
val 1 port 2
lscfg: The port cannot be moved to the requested switch because
port or ports have Encryption/Compression enabled. Please disable
the Encryption/Compression configuration.
    FID:
            15
    Slot:
              0
    Port:
              2
```

To disable the compression configuration:

```
switch:admin> portcfgcompress --disable 2
```

To attempt to move a configured port to another logical switch:

SEE ALSO portCfgEncrypt, portEncCompShow

portCfgCreditRecovery

Enables or disables credit recovery on a port.

SYNOPSIS portcfgcreditrecovery --enable [slot/]port

portcfgcreditrecovery --disable [slot/]port

DESCRIPTION Use this command to enable or disable credit recovery on a port.

The credit recovery feature enables credits or frames to be recovered. Only ports configured as long distance ports can utilize the credit recovery feature. The default credit recovery configuration is enabled.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

The Fabric OS port configuration commands are not supported on FCoE ports.

OPERANDS This command has the following operands:

--disable

Disables credit recovery configuration on the specified port.

--enable

Enables credit recovery configuration on the specified port.

--help

Displays the command usage.

EXAMPLES To enable credit recovery on a port:

switch:admin> portcfgcreditrecovery --enable 3/15

To disable credit recovery on a port:

portcfgcreditrecovery --disable 3/15

SEE ALSO portCfgShow

portCfgDefault

Resets the port configuration to factory default value.

SYNOPSIS portcfqdefault [slot/][qe]port

DESCRIPTION

Use this command to reset all configuration values on a specified port to their factory defaults. This command persistently disables ports capable of routing, which is the factory default value. Use the portCfgShow command to display the port configuration.

This command does not change the state of a port. To change the state of an E_Port, use either switchDisable/switchEnable or portDisable/portEnable.

When issued on a Brocade 8000 in Access Gateway mode, this command resets the buffer limited mode on all N Ports. It also returns the maximum NPIV per port login limit to the default value of 126 on all ports, including FCoE ports.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be reset, followed

by a slash (/).

port

Specifies the number of the port to be reset, relative to its slot for bladed systems.

Use switchShow to list of valid ports.

EXAMPLES

To reset a port to factory defaults:

```
switch:admin> portcfgdefault 1/3
```

To reset a GbE port to factory defaults:

```
switch:admin> portcfgdefault 8/ge1
```

To reset a an FCoE port on a Brocade 8000 in Access Gateway mode:

```
switch:admin> portcfgdefault 13
```

```
switch:admin> portcfgshow
Area Number:
                         13
                         AUTO(HW)

portCfgDPort

Configures a port as a D_Port.

SYNOPSIS

portcfqdport --enable [slot/]port list

portcfqdport --disable [slot/]port list

portcfgdport --help

DESCRIPTION

Use this command to configure a diagnostic port (D_Port). The D_Port is not part of the fabric. It does not carry any interswitch traffic or data traffic. The D_Port is used solely for the purpose of running link-level diagnostics between two switches and to isolate link level fault on the port, in the small form factor pluggable (SFP), or in the cable.

You must configure both ends of the link between a given pair of switches, and you must disable the port before you can configure a D_Port. Re-enabling the D_Ports will automatically start the diagnostics when the ports come online.

The D_Port test performs the following diagnostics:

- An electrical loopback test (supported only on 16G SFPs capable of electrical loopback)
- An optical loopback test (supported only on 16G SFPs capable of optical loopback)
- A link traffic test
- A link distance measurement

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

This command is supported only on Fibre Channel ports. SFPs must be 10G or 16G Brocade-branded SFPs and run Fabric OS v7.0.0 or later.

This command is not supported on the Brocade FC8-32E and Brocade FC8-48E port blades.

D Port configuration is not supported on interchassis link (ICL) ports, EX Ports, F Ports, or N Ports (both in Access Gateway and Host Bus Adapters). D_Port configuration will fail if the port is configured in R_RDY mode, encryption mode, or compression mode. Links with D_Port configuration mismatch will segment.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be configured, followed by a slash (/).

port_list

Specifies one or more ports, relative to the slot on bladed systems. Use switchShow for a listing of valid ports. A port list should be enclosed in double quotation marks and can consist of the following:

- A single port, for example, "8" or "5/8" on blades systems.
- A port range where beginning and end port are separated by a dash, for example, "8-13" or "5/8-13" on blades systems. A port range cannot span multiple slots.
- A set of ports separated by spaces, for example "3 5 7 8" or 5/3 5/5 5/7 5/8 on bladed systems.

- A set of ports separated by commas, for example "3,5,7,8" or 5/3,5,7,8 on bladed systems.
- A wildcard '*' indicates all ports. The wild card should be enclosed in single quotation marks.

--enable

Configures the specified ports as D_Ports.

--disable

Clears the D_Port configuration on the specified ports.

--help

Displays the command usage.

EXAMPLES

To configure a single port as a D_Port:

```
switch:admin> portdisable 42
switch:admin> portcfgdport --enable 42
switch:admin> portenable 42
```

To clear the D_Port configuration:

```
switch:admin> portdisable 42
switch:admin> portcfgdport --disable 42
switch:admin> portenable 42
```

SEE ALSO

fabricLog, portCfg, portDPortTest, portShow, switchShow

portCfgEncrypt

Configures a port for encryption.

SYNOPSIS portcfgencrypt --enable [slot]/port

portcfgencrypt --disable [slot]/port

portcfgencrypt --help

DESCRIPTION

Use this command to configure a port for encryption. This command enables or disables the encryption configuration on the specified port and saves the configuration persistently.

Before you can configure a port for encryption, you must configure the port for authentication. When disabling encryption, you must disable the encryption configuration before you can disable authentication. Refer to the Fabric OS Encryption Administrator's Guide for more information.

Configuring a port for encryption is disruptive. You must disable the port before you can enable encryption on the port. This command fails on an enabled port.

The number of configurable ports is limited per ASIC. Use the portEncCompShow for a listing of configurable ports per ASIC.

NOTES

This command is supported only on E_Ports. An E_Port can be enabled for compression and for encryption at the same time.

When you move a configured port to another logical switch, you are informed that the operation requires that the port configuration be disabled. You are given the choice to cancel the move or to continue. If you want to go ahead with the move and the port is configured for encryption or compression, you must disable the configuration prior to moving the port. You must reconfigure the port on the target switch if you want to use compression or encryption on that port.

This command is supported only on Condor 3-based platforms running Fabric OS v7.0.0 or later with the exception of the Brocade 6505 switch and the Brocade FC8-32E and Brocade FC8-48E port blades.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be configured,

followed by a slash (/).

port

Specifies the port to be configured.

--enable

Enables the encryption configuration on the specified port.

--disable

Disables the encryption configuration on the specified port.

--help

Displays the command usage.

EXAMPLES

To enable the encryption configuration:

switch:admin> portcfgencrypt --enable 2

To attempt to move a configured port to another logical switch:

```
switch:admin> lscfg --config 15 -port 2
This operation requires that the affected ports be disabled.
Would you like to continue [y/n]?: y
Checking for cap port 2
After Checking for cap port 2
val 1 port 2
lscfg: The port cannot be moved to the requested switch because port or ports have Encryption/Compression enabled. Please disable the Encryption/Compression configuration.
    FID: 15
    Slot: 0
    Port: 2
```

To disable the encryption configuration:

```
switch:admin> portcfgencrypt --disable 2
```

SEE ALSO authUtil, portCfgCompress, portEncCompShow, secAuthSecret

portCfgEport

Enables or disables E_Port capability on a port or locks down a port as an E_Port.

SYNOPSIS

portcfgeport [slot/]port mode

portcfgeport -i [index1[-index2] [...] [-f] mode]

portcfgeport -slot [slot1[-slot2] [...]

portcfgeport -h

DESCRIPTION

Use this command to enable or disable E Port capability on a port or to lock down a port as an E Port. E_Port capability is enabled by default. When an interswitch link (ISL) is connected to a port and the port's E_Port capability is disabled, the ISL is segmented, and all traffic between the switches stops. Fabric management data, such as zoning information, can no longer be exchanged through this port.

You can identify a single port to be configured by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use switchShow for a listing of valid ports, slots, and port index numbers. When used without operands, this command displays all persistently disabled ports on the switch.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if portSwap is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the portSwap status or alternately use portSwapShow.

Changes made by this command are persistent across switch reboots or power cycles.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Regardless of how many E_Ports are connected between two switches, the maximum routing paths are limited to 16 E Ports.

The Fabric OS port configuration commands are not supported on FCoE ports.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured,

followed by a slash (/).

port

Specifies the number of the port to be configured, relative to its slot for bladed

systems. Use **switchShow** to display a listing of valid ports.

-i index1[-index2]

Specifies a range of ports identified by port index numbers. You may specify multiple index ranges separated by a space, for example, -i 33-38 40-60.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot [*slot1*[*-slot2*]

Specifies all ports on a slot or on a range of slots, for example, -s 3-5. You may specify multiple slot ranges separated by a space, for example, -s 3-5 8-10.

```
mode
                                    Specifies the E_Port configuration as one of the following:
                   0
                                    Disables E_Port capability for the specified ports.
                   1
                                    Enables the ports as E_Ports. This is the default port state.
                   2
                                    Locks down the ports as E_Ports. This command effectively disables the port's
                                    F_Port capability.
              -h
                                    Displays the command usage.
EXAMPLES
               To disable E_Port capability on a port:
                   switch:admin> portcfgeport 1/3 0
              To enable E_Port capability on a port:
                   switch:admin> portcfgeport 1/3 1
              To lock down the port as an E_Port.
                   switch:admin> portcfgeport 1/3 2
              To disable E_Port capability on a range of ports specified by their index number:
                   switch:admin> portcfgeport -i 12-18 0
              To enable E_Port capability on all ports of slot 3-5:
                   switch:admin> portcfgeport -s 3-5 1
SEE ALSO
              portShow, portSwapDisable, portSwapShow, switchShow
```

portCfgEXPort

Sets a port to be an EX_Port, and sets and displays EX_Port configuration parameters.

SYNOPSIS portcfqexport [slot/]port

portcfgexport [-a admin]

portcfgexport [-f fabricid]

portcfgexport [-r ratov]

portcfgexport [-e edtov]

portcfgexport [-d domainid]

portcfgexport [-p pidformat]

portcfqexport [-t fabric parameter]

portcfgexport [-m port mode]

portcfqexport [-i mode]

DESCRIPTION

Use this command to allow a port to be configured as an EX Port, to display the port's EX Port configuration, or to change the configuration. If no optional parameter is specified, the command displays the currently configured values; otherwise, it sets the specified attribute to its new value. The port must be disabled prior to setting EX_Port attributes. The port must be enabled before the port can become active following EX_Port parameter changes. Use portDisable and portEnable to disable or enable the

IPFC over FCR allows the routing of IPFC traffic between different EX_Ports where EX_Ports are connected to an edge fabric that has IPFC-capable devices. IPFC traffic is routed between EX and VEX Ports. IPFC traffic can be related to the same edge fabric or to different edge fabrics.

When the port is not active, the preferred domain ID is configurable. The preferred domain ID is used by the EX_Port's front phantom domain to request a domain ID from the principal switch. The domain ID received becomes the subsequent preferred domain ID, which is persistent and is displayed.

FCR supports FCR connections to McDATA Open Fabric Mode fabrics operating in 239 domain ID mode. The 239 DID mode is only supported on the Brocade Mi10k director. The portCfgExport command displays the Domain ID mode of the McDATA edge fabric. Refer to the Examples section for an illustration of this feature.

FCR supports Network OS edge (NOS) fabric connectivity when the EX_Port is set to Brocade Network OS fabric mode. No Integrated Routing License is required to support Network OS fabric connectivity, and selective device sharing will be allowed even when a license is not present.

NOTES

The fabric ID must be the same for every router port connected to the same edge fabric, and different for every edge fabric. If two ports are connected to the same fabric but have been assigned different fabric IDs, one of them will be disabled due to a fabric ID oversubscription. If two fabrics have been assigned the same fabric ID, one of them will be disabled due to a fabric ID conflict.

When a port is changed from FL_Port to EX_Port, the topology is implicitly changed to point-to-point.

The front domain WWN field displays the WWN of the front domain. If the port is enabled and the state is "OK", the edge fabric principal switch domain ID and WWN also are displayed.

If the Fabric Parameter value is "Auto Negotiate", the port ID format, R_A_TOV, and E_D_TOV values display the negotiated values indicated by "(N)" next to them. The negotiated values are what the edge switch specifies in the ELP request. If the state is "Not OK", the R_A_TOV and E_D_TOV display "Not Applicable". By default, all EX_Ports are auto-ELP enabled.

If the Fabric Parameter attribute value is "User configured", the port ID format R_A_TOV and E_D_TOV values display the configured values.

A configuration change that would result in an invalid domain ID for McDATA Open Fabric mode or McDATA Fabric mode causes the preferred domain ID to be set to the minimum valid McDATA mode domain ID of 1. The exception to this is if the configuration change includes setting the preferred domain ID, in which case the configuration change does not take place and a corresponding error message is displayed.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

When invoked without operands, this command displays the usage. The following operands are supported:

slot

On bladed systems only, specifies the slot number followed by a slash (/).

port

Specifies the port number. Use **switchShow** for a list of valid ports. When executed with [slot/]port only, the command displays the current port

configuration.

-a admin

Enables or disables the specified port as an EX_Port. Valid values are 1 (enable as EX_Port), 2 (disable as EX_Port and enable as non-EX_Port). **portCfgDefault** may also be used to disable EX_Ports.

-f fabricid

Specifies the fabric ID. Valid values are 1 to 128.

-r ratov

Specifies the R_A_TOV used for port negotiation. Valid values are 2000 to 120000. This operand is only applicable if the "Fabric Parameter" attribute value is not "Auto Negotiate".

-e edtov

Specifies the E_D_TOV used for port negotiation. Valid values are 1000 to 60000. This operand is only applicable if the "Fabric Parameter" attribute value is not "Auto Negotiate".

-d domainid

Specifies the preferred domain ID. For Brocade native mode (-m 0) or McDATA Open Fabric mode (-m 1), valid values are 1 to 239. Use 239 for connectivity with the Mi10k director. For McDATA Fabric mode (-m 2), valid values are 1 to 31.

-p pidformat

Specifies the Port ID format. Valid values are 0-native, 1-core, 2-extended edge. This operand is applicable only when port mode is set to 0 (native mode). If port mode is not "Brocade Native", the Port ID format displays as "Not applicable".

-t fabric_parameter

Enables or disables negotiation of the fabric parameters. Valid values are 1 for enable and 2 for disable.

-m	port	mode

Specifies the port mode. The **-m** option enforces the same port mode for all the ports connected to the same edge fabric. If this option is selected, the port mode is compared against the online ports. If the modes are different, an error message is posted, and the command fails. Valid values are as follows:

0

Brocade Native mode.

McDATA Open Fabric mode.

McDATA Fabric mode.

3

MCDATA fabric legacy mode.

5

Brocade Network OS fabric mode.

-i mode

Enables or disables Insistent Domain Id (IDID) for the specified EX_Port. Specify 1 to enable IDID, specify 2 to disable IDID. This command must be issued from a McDATA edge switch attached to a single or dual FCR configuration.

EXAMPLES

To set the fabric ID of port 2/1 to 5 and the port ID format to core:

```
switch:admin> portcfgexport 2/1 -f 5 -p 1
```

To configure port 2/0 to be an EX_Port and set the fabric ID to 4:

```
switch:admin> portcfgexport 2/0 -a 1 -f 4
```

To disable fabric parameter negotiation on port 2/0 of an EX_Port:

```
switch:admin> portcfgexport 2/0 -t 2
```

To enable IDID on port 2:

```
switch:admin> portcfgexport 2 -i 1
```

To display EX_Port settings configured for Mi10K connectivity:

```
switch:admin> portcfgexport 10
```

SEE ALSO portCfgVEXPort, portDisable, portEnable, portShow, portCfgDefault, fcrBcastConfig

portCfgFaultDelay

Configures the fault delay for a single FC port.

SYNOPSIS portcfqfaultdelay [slot/]port delay

portcfgfaultdelay --help

DESCRIPTION

Use this command to configure the fault delay of an FC port.

In the event that the link is noisy after a host power cycle, the switch may go into a soft fault state, which means a delay of R_A_TOV. Setting the mode value to 1 reduces the fault delay value to 1.2 seconds. The configuration is stored in nonvolatile memory and is persistent across switch reboots and power

Use the **portCfqShow** command to display the user-configured fault delay settings.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is applicable only to Fibre Channel ports.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured,

followed by a slash (/).

port

Specifies the number of the port to be configured, relative to its slot for bladed

systems. Use switchShow for a listing of valid ports.

delay

Specifies the fault delay value for the port number. This operand is required. Valid

values are one of the following:

0

Sets the fault delay to R_A_TOV (default).

1

Sets the fault delay to 1.2 seconds.

---help

Displays the command usage.

EXAMPLES

To set the fault delay of a port to 1.2 seconds:

```
switch:admin> portcfgfaultdelay 2/3 1
```

To display the configuration

```
switch:admin> portcfgshow 2/3
```

SEE ALSO portCfgShow

portCfgFec

Enables or disables the Forward Error Correction flag in the chassis configuration file.

SYNOPSIS

portcfgfec --enable [slot/|port[-port]

portcfgfec --disable [slot/|port[-port]

portcfgfec --show

portcfgfec --help

DESCRIPTION

Use this command to enable or disable the Forward Error Correction (FEC) flag on a specified port or on a range of ports, or to display the configuration. If the FEC flag is already enabled on the ports, this command takes no action. If a range of ports is specified, some of which are already in the requested configuration, a notification is generated, and no action is taken for those ports only. All other ports in the specified range are updated. Execution of this command is non-disruptive.

The default behavior of FEC is to obtain method error control in data transmissions in which the source (transmitter) sends redundant data and the destination (receiver) recognizes only the portion of the data that contains no apparent errors.

FEC does not require handshaking between the source and the destination ,it can be used for broadcasting of data to many destinations simultaneously from a single source. In the simplest form of FEC, each character is sent twice. The receiver checks both instances of each character for adherence to the protocol being used. If conformity occurs in both instances, the character is accepted. If conformity occurs in one instance and not in the other, the character that conforms to the protocol is accepted. If conformity does not occur in either instance, the character is rejected and a blank space or an underscore (_) is displayed in its place.

NOTES

Forward Error Correction is supported only on Condor 3-based platforms with port speeds of 10 Gbps and 16 Gbps.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be configured,

followed by a slash (/).

port[-port]

Specifies a port or a port range, relative to the slot number on bladed systems, for

example, 5/17-29. Multiple port ranges are not supported with this command. .

--enable

Enables the FEC flag on the specified ports.

--disable

Disables the FEC flag on the specified ports.

--show

Displays the FEC port configuration. The output displays the following

parameters:

Forward Error Correction capable

Displays ON if the port supports FEC. Displays OFF if the port does not support FEC.

Forward Error Correction configured

Displays ON if FEC is enabled on the port. Displays OFF if the feature is disabled (default).

--help

Displays the command usage.

EXAMPLES

To enable the FEC feature on a single port and to display the configuration:

```
switch:admin> portcfgfec --enable 1
switch:admin> portcfgfec --show 1
Forward Error Correction capable:
                                      ON
Forward Error Correction configured: ON
```

To enable the FEC feature on a port, on which this feature is already enabled:

```
switch:admin> portcfgfec --enable 18
Same configuration for port 8
```

To enable the FEC feature on a port range:

```
switch:admin> portcfgfec --enable 0-8
```

To enable the FEC feature on a range of ports, some of which were previously enabled (the following example enables port 4):

```
switch:admin> portcfgfec --enable 2-4
Same configuration for port 2
Same configuration for port 3
```

To disable the FEC feature on a port range:

```
switch:admin> portcfgfec --enable 0-8
```

SEE ALSO

portCfgShow, portEnable

portCfgFillword

Configures the fill word for a single 8G FC port.

SYNOPSIS portcfgfillword [slot/]port, mode [passive]

portcfgfillword --help

DESCRIPTION

Use this command to configure the fill word of an 8G FC port. By default, this command disables and re-enables the port and the port comes online with the new fill word setting. When used with the **passive** option, the new settings are not applied until the next time the port goes offline and comes back online. The configuration is stored in nonvolatile memory and is persistent across switch reboots or power cycles.

NOTES

This command applicable only to 8G FC ports; it is not supported on Condor 3-based platforms.

This configuration cannot be set on VE Ports or VEX Ports.

Use the portCfgShow command to display user-configured fill word settings.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured,

followed by a slash (/).

port

Specifies the number of the port to be configured, relative to its slot for bladed

systems. Use switchShow for a listing of valid ports.

mode

Specifies the fill word for the port number. This operand is required. Valid values are one of the following:

0 | -idle-idle

Sets IDLE mode in the Link Init and IDLE as the fill word (default).

1 | -arbff-arbff

Sets ARB(ff) in the Link Init and ARB(ff) as the fill word.

2 | -idlef-arbff

Sets IDLE mode in the Link Init and ARB(ff) as the fill word.

3 | -aa-then-ia

Attempts hardware arbff-arbff (mode 1) first. If the attempt fails to go into active state, this command executes software idle-arb (mode 2). Mode 3 is the preferable to modes 1 and 2 as it captures more cases.

passive

Postpones the new settings to take effect only after the next time the port goes offline and comes back up. This operand is optional. It prevents immediate application of the new settings through a disruptive **portDisable** and **portEnable** operation.

EXAMPLES

To set the fill word of a port to ARBFF-ARBFF using the numeric mode notation:

switch:admin> portcfgfillword 2/3, 1

To set the fill word of a port to ARBFF-ARBFF using the -arbff-arbff option:

```
switch:admin> portcfgfillword 2/3, -arbff-arbff
```

To set the fill word of a port to IDLE-ARBFF using the **-idle-arbff** option:

```
switch:admin> portcfgfillword 27, -idle-arbff
switch:admin> portcfgshow 27
Area Number:
                             AUTO(HW)
Speed Level:
Fill Word(On Active) 2(SW Idle-Arbff)
Fill Word(Current) 2(SW Idle-Arbff)
(output truncated)
```

To set the fill word of a port to the preferred mode 3 (If hardware arb-arbff fails, try software idle-arbff) and using the passive option:

```
switch:admin> portcfgfillword 28 -aa-then-ia passive
switch:admin> portcfgshow 28
Area Number:
                AUTO(HW)
Speed Level:
Fill Word(On Active) 3(A-A then SW I-A)
Fill Word(Current) 0(Idle-Idle)
(output truncated)

SEE ALSO portCfgShow

portCfgFportBuffers

Configures F_Port buffer allocation.

SYNOPSIS portcfgfportbuffers -- enable [slot/]port buffers

portcfgfportbuffers --disable [slot/]port

DESCRIPTION

Use this command to change the default buffer allocation for an F_Port and to allocate a specified number of buffers to the port. When port buffer allocation is enabled, the number of buffers specified override the default F_Port buffer allocation. When the configuration is disabled, the default buffer allocation is restored. Only an F_Port can utilize the buffers allocated by this command, and the allocated buffers are reserved only for this port.

The F_Port buffer configuration is persistent across system reboots.

Use the **portBufferShow** command to determine current port buffer allocations.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The F_Port buffer feature does not support ports configured as EX_Ports, Mirror Ports, Long Distance Ports, L_Ports, QoS Ports, Fast Write, and Trunk Areas.

The Fabric OS port configuration commands are not supported on FCoE ports.

OPERANDS

This command has the following operands:

--enable

Enables the F_Port buffer configuration on a specified port. A port and buffer allocation must be specified with this option.

--disable

Disables the F_Port buffer configuration on a specified port.

slot

Specifies the slot number on bladed systems, followed by a slash (/).

buffers

Specifies the number of buffers to be allocated to the specified port. The specified buffer allocation takes effect when the F_Port comes online. This operand is required with the **--enable** option. The minimum buffer allocation is the default number of buffers plus 1. The maximum is determined by the remaining buffer allocations in the port's port group. Use **portBufferShow** to determine the number of remaining free buffers.

EXAMPLES

To allocate 12 buffers to an F_Port:

switch:admin> portcfgfportbuffers --enable 2/44 12

To disable the port buffer configuration and return to the default buffer allocation:

switch:admin> portcfgfportbuffers --disable 2/44 12

portBufferShow

portCfgGeMediaType

Sets the selected mode for the ge0 and ge1 ports on the Brocade 7800.

SYNOPSIS

portcfggemediatype ge_port [optical | copper]

portcfggemediatype --help

DESCRIPTION

Use this command to set the mode for ge0 and ge1 ports on the Brocade 7800.

Each of the ge0 and ge1 ports on the Brocade 7800 can be configured as a copper port (RJ45) or an optical port (SFP). The copper ports (RJ45) can only accept copper connections. The optical ports can accept any Brocade-branded SFP, optical or copper. Each of the ge0 and ge1 ports can be configured either as a copper port or an optical port, but not both.

The following configurations are possible:

Default

- ge0 (RJ45) active and ge0 (SFP) inactive
- ge1 (RJ45) active and ge1 (SFP) inactive

One copper and one optical port active

- ge0 (RJ45) active and ge0 (SFP) inactive
- ge1 (RJ45) inactive and ge1 (SFP) inactive

Or:

- ge1 (RJ45) inactive and ge1 (SFP) active
- ge0 (RJ45) active and ge0 (SFP) active

Both copper ports inactive. Both optical SPP ports active

- Ge0 (RJ45) inactive and Ge0 (SFP) active
- Ge1 (RJ45) inactive and Ge1 (SFP) active

The copper-only GbE ports are selected by default. To select ge0 or ge1 as optical mode specify the operand as **optical**. Specify **copper** to re-select the default copper port.

When used with the *ge_port* operand only, this command displays the currently selected GbE port and media type.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only on the Brocade 7800 and only on ge1 and ge0 ports. On all other platforms or ports, this command returns a "not supported message."

OPERANDS

This command has the following operands:

ge_Port

Specifies the GbE port to be selected. Valid ports are ge0 and ge1. This operand is required.

optical | copper

Specifies which mode to select. Specifying **optical** selects the optical mode for the GbE port. Specifying **copper** selects a copper mode for the GbE port. This operand is optional; if omitted, the current media type is displayed for the specified GbE port.

--help

Displays the command usage.

EXAMPLES

To select an optical mode for ge0:

```
switch:admin> portcfggemediatype ge0 optical
```

To display the current configuration:

```
switch:admin> portcfggemediatype ge0
Port gel is configured in optical mode
```

To restore the default configuration (copper only ports are selected):

```
switch:admin> portcfggemediatype ge0 copper
switch:admin> portcfggemediatype ge0
Port ge0 is configured in copper mode
```

SEE ALSO portCfgShow

portCfgGport

Designates a port as a G_Port; removes G_Port designation.

SYNOPSIS portcfggport [slot/]port,mode

DESCRIPTION Use this command to designate a port as a G_Port. After successful execution of this command, the

> switch attempts to initialize the specified port as an F_Port only, and does not attempt loop initialization (FL_Port) on the port. A port designated as a G_Port can become an E_Port. This configuration can be cleared but not set on VE/VEX_Ports. Changes made by this command are persistent across switch

reboots or power cycles.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to be configured,

followed by a slash (/).

port

Specify the port to be configured, relative to its slot for bladed systems. Use

switchShow to display a list of valid ports.

mode

Specify a value of 1 to designate the port as a G_Port or specify a value of 0 to remove the G_Port designation from the port. A value of 0 is the default port state.

Mode must be preceded by a comma. This operand is required.

EXAMPLES To configure port as a locked G_Port:

switch:admin> portcfggport 1/3, 1

SEE ALSO configure, portCfgLport, portShow, switchShow

portCfgISLMode

Enables or disables ISL R_RDY mode on a port.

SYNOPSIS port

portcfgisImode [slot/]port,mode

DESCRIPTION

Use this command to enable or disable interswitch link read-ready (ISL R_RDY) mode on a port. Use the **portCfgShow** command to determine whether ISL R_RDY mode is enabled on a port.

In ISL R_RDY mode, the port sends a primitive signal that the port is ready to receive frames. The port sends an exchange link parameter (ELP) with flow control mode 02. If a port is ISL R_RDY enabled, it can only receive an ELP with flow control mode 02. A received ELP with flow control mode 01 will segment the fabric.

This mode cannot detect any inconsistencies in fabric operating mode parameters, such as the PID format of connected ports. Before enabling ISL R_RDY mode, ensure that all fabric-wide parameters are consistent for every switch in the fabric.

Use **configShow fabric.ops** to view a complete listing of fabric operating mode parameters on the switch.

The following E_Port configurations are not applicable to a port configured for ISL R_RDY mode. If configured, these port configuration parameters are ignored during E_Port initialization:

- Trunk port
- VC link init

The **portCfgISLMode** and **portCfgLongDistance** levels LE, LD, or LS only can be enabled at the same time. Such an ISL uses R_RDY mode of flow control over the long distance link. This feature is not backward compatible with firmware versions that do not support it.

NOTES

Changes made by portCfgISLMode are persistent across switch reboots and power cycles.

This configuration can be cleared but not set on VE/VEX Ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The Fabric OS port configuration commands are not supported on FCoE ports.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to display, followed by

a slash (/).

port

Specify the port to display, relative to its slot for bladed systems. Use **switchShow**

to list valid ports.

mode

Specify 1 to enable ISL R_RDY mode. Specify 0 to disable ISL R_RDY mode.

EXAMPLES

To enable ISL R_RDY mode on a port:

```
switch:admin> portcfgislmode 1/3, 1
ISL R_RDY Mode is enabled for port 3. Please make sure
the PID formats are consistent across the entire fabric.
```

To disable ISL R_RDY mode on a port:

switch:admin> portcfgislmode 1/3, 0

SEE ALSO

configure, portCfgLongDistance, portCfgShow

portCfgLongDistance

Configures a port to support long distance links.

SYNOPSIS

portcfglongdistance [slot/]port

[distance_level]
[vc_translation_link_init]
[desired_distance]

DESCRIPTION

Use this command to allocate frame buffer credits to a port or to configure a specified long distance link. The port can only be used as an E_Port. Changes made by this command are persistent across switch reboots and power cycles. This configuration can be cleared but not set on VE/VEX_Ports.

Long distance configuration allows native FC ports to run WAN/LAN connections. It ensures that the full bandwidth of a link or trunk can be utilized for a particular long distance configuration. The receiving port must have sufficient buffers available, so that the transmitting port can stuff the link with enough frames to fill the entire length of the link. As the distance between switches and the link speed increases, additional buffer-to-buffer credits are required to maintain maximum performance. If a port is configured as a long distance port, the remaining ports of that port group could be disabled, fail to initialize, or move to "buffer limited" mode due to a lack of frame buffer credits.

The number of credits reserved for a port depends on the switch model and on the extended fabric mode for which it is configured. Not all distance modes are supported by all platforms. For example, the FC10-6 only supports LO and LS up to 120 km at 10 Gbps, and the maximum supported distance can vary greatly depending on switch platform and available buffers. Refer to the *Fabric OS Administrator's Guide* for details on platform-specific buffer credit models, long distance mode support, and maximum distance supported for specific hardware configurations.

NOTES

This command requires an Extended Fabrics license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

A long-distance link can also be configured to be part of a trunk group. Refer to **portCfgTrunkPort** help for details.

When a port is configured as a long-distance port, the output of **portShow** and **switchShow** displays the long-distance level. Refer to **portShow** help and **switchShow** help for details.

The **portCfglSLMode** and **portCfgLongDistance** LE, LD, or LS levels can be enabled at the same time. Such an ISL uses the R_RDY mode of flow control over the long distance link. While using R_RDY mode flow control, an E_Port cannot form trunk groups of long-distance links even if the trunking is enabled. This feature is not backward compatible with firmware versions that do not support it.

Ctrl-D cancels the configuration update.

The Fabric OS port configuration commands are not supported on FCoE ports.

OPERANDS

This command has the following operands:

slot

Specify the slot number (for bladed systems only), followed by a slash (/).

port

Specify the number of the port to be configured relative to its slot for bladed systems. Use **switchShow** to display a list of valid ports. This operand is required.

distance_level

Specify the long distance level as one of the following (the numerical value representing each *distance_level* is shown in parentheses):

L0 (0)

Specify L0 to configure the port as a regular port. A total of 20 full-size frame buffers are reserved for data traffic, regardless of the port's operating speed; therefore, the maximum supported link distance is up to 5 km at 2 Gbps, up to 2 km at 4 Gbps and up to 1 km at 8, 10, and 16 Gbps.

LE (3)

Specify LE mode to configure an E_Ports distance greater than 5 km and up to 10 km. A total of 5, 10, 20, 40, 50, and 80 full-size frame buffers are reserved for data traffic at port speeds of 1 Gbps, 2 Gbps, 4 Gbps, 8, 10, and 16 Gbps. LE does not require an Extended Fabrics license. If a port in LE mode is set to autonegotiation, it will reserve the buffers for the highest support speed on that port. If this is not the desired buffer allocation, you should set the port to a fixed speed.

LD (5)

Specify LD for automatic long-distance configuration. The buffer credits for the given E_Port are automatically configured based on the actual link distance. Up to a total of 1452 full-size frame buffers are reserved depending on the distance measured during E_Port initialization. If a value for <code>desired_distance</code> is specified, it is used as the upper limit to the measured distance. If a port in LD mode is set to autonegotiation, it will reserve the buffers for the highest support speed on that port. If this is not the desired buffer allocation, you should set the port to a fixed speed.

LS (6)

Specify LS mode to configure a static long distance link with a fixed buffer allocation greater than 10 km. Up to a total of 1452 full-size frame buffers are reserved for data traffic, depending on the specified *desired_distance* value. If a port in LS mode is set to autonegotiation, it will reserve the buffers for the highest support speed on that port. If this is not the desired buffer allocation, you should set the port to a fixed speed.

vc_translation_link_init

Specifies the fill words used on long distance links. When set to 1, the link uses ARB fill words (default). When set to 0, the link uses IDLE fill words. The IDLE fill word option is not compatible with QoS configured links and Credit Recovery enabled links. You must disable these features before configuring long distance IDLE fill words.

desired_distance

This parameter is required when a port is configured as an LD or an LS mode link. In LD mode, the value of desired_distance is the upper limit of the link distance and is used to calculate buffer availability for other ports in the same port group. When the measured distance exceeds the value of <code>desired_distance</code>, this value is used to allocate the buffers. In this case, the port operates in degraded mode instead of being disabled due to insufficient buffers. In LS mode, the actual link distance is not measured, instead the <code>desired_distance</code> is used to allocate the buffers required for the port.

EXAMPLES

To configure a switch port 63 to support a 100 km link and be initialized using the long distance link initialization protocol:

```
portState: 2 Offline
portPhys: 4 No_Light
portScn: 0
portId: 013f00
portWwn: 20:3f:00:60:69:00:02:48
Distance: super long <= 100km
portSpeed: 2Gbps
Interrupts: 9 Link_failure: 0 Frjt: 0
Unknown: 0 Loss_of_sync: 0 Lli: 9 Loss_of_sig: 9
                                      Fbsy: 0
Proc_rqrd: 0 Protocol_err: 0 Timed_out: 0 Invalid_word: 0
Rx_flushed: 0 Invalid_crc: 0
Tx_unavail: 0 Delim_err: 0
Free_buffer: 0 Address_err: 0

Suspended: 0 Lr_out: 0
Parity_err: 0 Ols_in: 0
2_parity_err: 0 Ols_out: 0
CMI_bus_err: 0
```

SEE ALSO configure, portCfglSLMode, portCfgTrunkPort, portCfgShow, portShow, switchShow

portCfgLossTov

Enables or disables de-bouncing of signal loss for front end ports.

SYNOPSIS portcfglosstov [slot/]port mode

DESCRIPTION Use this command to enable or disable the de-bouncing of loss of signal for 100 ms for front end ports.

Use **portCfgShow** to display the current setting.

If executed without operands, the command prints the usage.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

On a chassis, this command must be executed on the active CP.

OPERANDS This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured,

followed by a slash (/).

port

Specifies the port to be configured, relative to its slot for bladed systems. Use

switchShow to list valid ports.

mode

Specify 1 to enable the configuration. Specify 0 to disable the configuration.

EXAMPLES To enable the configuration on port 1/5 and to display the configuration: switch:admin> portcfglosstov 1/5 1

```
switch:admin> portcfgshow 1/5
Area Number: 5
Speed Level:
                      AUTO (HW)
Fill Word(On Active):
                      0(Idle-Idle)
Fill Word(Current): 0(Idle-Idle)
AL_PA Offset 13:
                      OFF
Trunk Port
                       on
```

Long Distance OFF VC Link Init OFF Locked L_Port OFF Locked G_Port OFF Disabled E_Port OFF Locked E_Port OFF ISL R_RDY Mode OFF RSCN Suppressed OFF Persistent Disable OFF LOS TOV enable ON (Output truncated)

To disable the configuration on port 1/5:

switch:admin> portcfglosstov 1/5 0

SEE ALSO portCfgShow

portCfgLport

Configures a port as an L_Port.

SYNOPSIS portcfqlport

[[slot/]port] locked_mode [private_mode] [duplex_mode]]

DESCRIPTION

Use this command to designate a port as an L_Port, and to configure its behavior. When a port is designated as an L_Port, the switch attempts to initialize that port as a fabric L_Port (FL_Port). The switch will never attempt a point-to-point (F_Port) initialization on the port. By default the L_Port will be a public L_Port. It can be configured as a private L_Port, in which case it will reject fabric login (FLOGI).

NOTES

This configuration can be cleared but not set on VE/VEX_Ports.

VE_Ports on the Brocade 7800 and FX8-24 platforms do not support Arbitrated Loops. If one of the virtual FC ports (16-31) is preconfigured as an L_Port, and a Brocade FX8-24 Extension blade is inserted into the slot, the configuration is not honored. The system logs a RASLOG error and the port defaults back to a G_Port. Attempts to configure a VE_Port as an L_Port are rejected with a corresponding system message.

The Fabric OS port configuration commands are not supported on FCoE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

When invoked without operands, this command reports the L_Port conditions for all ports present. The following operands are supported:

slot

For bladed systems only, specify the slot number of the port to be configured,

followed by a slash (/).

port

Specify a port number to be configured, relative to its slot for bladed systems. Use switchShow to display a list of valid ports. This operand is optional; if omitted,

this command displays the L Port conditions for all ports.

locked_mode

Specify 1 to configure the specified port as a locked L_Port. Specify 0 to remove the locked L_Port configuration from the port (default). This operand is required, if a port is specified.

private_mode

Specify 1 to configure the L_Port as a private L_Port. Specify 0 to configure the L Port as a public L Port. This operand is optional; if omitted; the default value of 0 is used. On unsupported platforms, this command is blocked and returns an appropriate message.

duplex_mode

Specify 2 to configure the specified port as a full-duplex L_Port with fairness. Specify 0 to configure the L_Port as a full-duplex L_Port. This operand is optional; if omitted, the default value of 0 is used.

EXAMPLES To configure ports 8, 14, and 15 as locked L_Ports:

switch:admin> portcfglport 4/8 4/14-15, 1

To display the L_Port conditions:

```
switch:admin> portcfglport
[...]
Ports of Slot 4 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
-----
[...]
Locked L_Port ..... ON ..... ON ON
(output truncated)
```

SEE ALSO configure, portCfgShow, portShow, switchShow

portCfgNPIVPort

Enables or disables N_Port ID virtualization (NPIV) functionality on a port and sets the per-port login limit.

SYNOPSIS portcfgnpivport --enable [slot/]port

portcfgnpivport --disable [s/ot/]port

portcfgnpivport --setloginlimit [slot/]port login_limit

portcfgnpivport --help

portcfgnpivport [slot/]port mode

DESCRIPTION

Use this command to enable or disable NPIV functionality on a port and to configure the maximum number of logins for this port. Changes made by this command are persistent across switch reboots and power cycles.

N_Port ID Virtualization (NPIV) enables a single Fibre Channel protocol port to appear as multiple, distinct ports, providing separate port identification within the fabric for each operating system image behind the port as if each operating system image had its own unique physical port. NPIV assigns a different virtual port ID to each Fibre Channel protocol device without impacting your existing hardware implementation. The virtual port has the same properties as an N_Port and is therefore capable of registering with all fabric services.

The following conditions must be met for a switch port to respond to NPIV requests from an NPIV device:

NPIV capable

NPIV capability is a switch blade or port attribute that is required for NPIV functionality. Some blades within a switch, or some ports within a switch or blade, may not have NPIV capability. NPIV functionality cannot be enabled on such ports and they do not respond to NPIV requests.

NPIV enabled

NPIV functionality must be enabled on a port for it to respond to NPIV requests. NPIV is enabled by default. It can be selectively disabled or re-enabled on specified switch ports using this command.

NPIV HA

To enable NPIV functionality on dual-CP systems, NPIV-enabled firmware must be running on both the active and the standby CPs. This requirement does not apply to single-CP systems.

Use the **--setloginlimit** option to configure the number of permitted logins per NPIV port. Up to 255 virtual port IDs are allocated per NPIV port, which means each NPIV port can support up to 255 logins. The number of logins you can configure per port is between 0 to 255. The default is 126 per port. The sum of all configured per-port login maximum values cannot exceed the total number of logins set for the switch with the **configure** command.

As of Fabric OS v.6.4.0 you can no longer use the **configure** command to set the NPIV port login limit on a per-switch basis. However, the maximum number of logins per switch is still set and enforced by the **configure** command. Use **configure** to display the current setting.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When using **portCfgNPIVPort** --disable or --enable on trunked ports, you must disable all trunk member ports before changing the NPIV capability on a trunk member and then re-enable the trunked ports to ensure that the configuration changes take effect.

Use the **portCfgShow** command to determine whether NPIV is enabled on a port and to display the maximum logins configured for that port. Use the **portCfgDefault** command to reset all port configurations, including the NPIV configuration of a port.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured,

followed by a slash (/).

port

Specifies the number of the port to be configured, relative to its slot for bladed

systems. Use switchShow for a listing of valid ports.

--enable

Enables NPIV on the specified port. This command can be executed only in

switch mode.

--disable

Disables NPIV on the specified port. This command can be executed only in

switch mode.

--setloginlimit login_limit

Sets the maximum number of allowed logins for the specified port. This command can be executed both in switch mode and Access Gateway mode. Valid values for

login_limit are 0 to 255. The default value is 126.

--help

Displays the command usage.

mode

Enables or disables NPIV on the specified port. Specify 1 to enable or 0 to disable the feature. The mode operand is a legacy command; it will be deprecated in a

future Fabric OS release.

EXAMPLES

To display the current NPIV port configuration:

switch:admin> portcfgshow

portCfgNPort

Enables or disables N_Port functionality for an Access Gateway port.

SYNOPSIS

portcfgnport [slot/]port1[-port2] [mode]

DESCRIPTION

Use this command to enable or disable N_Port functionality for an Access Gateway port or for a range of ports. The enabled N_Ports automatically come online if they are connected to an enterprise fabric switch that supports NPIV. When used without operands, this command displays the port configuration.

NOTES

NPIV capability must be enabled on the ports connected to the Access Gateway. By default, NPIV is enabled. Use **portcfgnpivport --enable** to enable NPIV capability on a port, if it was previously disabled. Note that enabling or disabling NPIV capability is no supported in Access Gateway mode.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following optional operands:

slot

Specifies the slot number, followed by a slash (/) on bladed systems.

port1[-port2]

Specifies a single port or a range of ports to be configured as N_Ports, for

example, 3-9, or 2/10-15.

mode

Enables (1) or disables (0) N_Port functionality on the specified ports. The default

mode is 0 (disabled).

EXAMPLES

To enable N_Port functionality for a port:

```
switch:admin> portcfgnport 8 1
```

To enable N Port functionality for a set of ports in a specific range:

```
switch:admin> portcfgnport 2-3 1
```

To display the N_Port configuration for all ports:

switch:admin> portcfg	npo	rt									
Ports	0	1	2	3	4	5	6	7	8	9 10	[]
+	+	+	+	+	+	+	+	+	+	++-	[]

SEE ALSO portCfgShow, ag

portCfgOctetSpeedCombo

Sets port speed combination for a port octet.

SYNOPSIS

portcfgoctetspeedcombo [slot|port combo

portcfgoctetspeedcombo [slot]port -default

DESCRIPTION

Use this command to configure the speed for a port octet. A Condor 3 ASIC has six octets, each of which contains eight ports. You can configure up to three different speed combinations. When you configure a given port, the combination applies to all ports in the octet. You can specify the octet by any port within the octet. To change the first octet, for example, you can specify any port from 0 through 7 as a port argument value. The following speed combinations are supported:

- Autonegotiated or fixed port speeds of 16 Gbps,8 Gbps,4 Gbps, and 2 Gbps (1)
- Autonegotiated or fixed port speeds of 10 Gbps,8 Gbps,4 Gbps, and 2 Gbps (2)
- Autonegotiated or fixed port speeds of 16 Gbps and 10 Gbps (3)

A port octet can be set to any of the three octet combinations, and the ports in the octet can run on any speed supported by its octet combination. This applies to both autonegotiated and fixed speeds.

Before you change the octet speed combination, make sure that the following conditions are met:

- All fixed speed ports are configured at a speed supported by the new combination.
- All online ports in autonegotiation mode have a negotiated speed supported by the new combination.
- If a port is running at a speed not supported in the new combo, you must disable the port or change the speed to a supported fixed speed before you can set the combo.

If any of the ports does not meet the conditions, the operation fails with an appropriate error message. You can change the port speed or disable the ports and retry the command.

The octet combination default is 1. Use the **portCfgOctetSpeedCombo** *port--***default** command to reset the octet combination to its default value.

NOTES

This command is supported only on Condor 3-based platforms and only on the first eight ports of a blade (slot) or a standalone switch. On the Brocade FC8-32E and Brocade FC8-48E port blades, only the default octet combination is supported. On the Brocade 6505, the command is not supported.

The operation of the **portCfgOctetSpeedCombo** can be disruptive. For example, when you install a 10G SFP in the first eight ports of the switch and subsequently change the speed for this octet from default to 2 or 3, the SFP does not receive a state change and continues to show the mod_inv state (Incompatible vendor or module speed mismatch). You must disable and re-enable the ports for the SFP to come online with the configured speed of 10 Gbps. The same is the case when you replace a 10G SFP with an 8G SFP or a 16G SFP with a 10G SFP.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the port to be configured, followed by a slash (/).

port

Sets the speed combination for the specified port and all other ports in the octet port group.

combo	
	Specifies the speed combination for the ports in the octet. The following speed combinations are supported:
1	
	Supports autonegotiated or fixed port speeds of 16 Gbps,8 Gbps,4 Gbps, and 2 Gbps.
2	
	Supports autonegotiated or fixed port speeds of 10 Gbps,8 Gbps,4 Gbps, and 2 Gbps.
3	
	Supports autonegotiated or fixed port speeds of 16 Gbps and 10 Gbps.

-default

Sets all octet combination values back to the default value of 1.

EXAMPLES

To configure the ports in first octet for combination 3 on a Brocade 6510:

```
switch:admin> portcfgoctetspeedcombo 3 3
```

To reset the combination to default:

```
switch:admin> portcfgoctetspeedcombo 3 --default
```

To switch from combo 3 to combo 2 and there are online ports running at 10G speed.:

```
switch:admin> portcfgoctetspeedcombo 2 2
The following ports must be disabled or \
   speed configuration needs to be change.
Please retry the operation after taking appropriate action.
```

portCfgPersistentDisable

Persistently disables a port or a range of ports.

SYNOPSIS portcfgpersistentdisable

. ...

portcfgpersistentdisable [slot/]port1[-port2] [...]

portcfgpersistentdisable -i [index1[-index2] [...] [-f]]

portcfgpersistentdisable -slot [slot1[-slot2] [...]

portcfgpersistentdisable -h

DESCRIPTION

Use this command to persistently disable a port or a range of ports. Persistently disabled ports remain disabled across power cycles, switch reboots, and switch enables. By default, a port is enabled persistently, unless the port is capable of routing. The change in configuration is effective immediately.

You can identify a single port to be configured by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use **switchShow** for a listing of valid ports, slots, and port index numbers. When used without operands, this command displays all persistently disabled ports on the switch.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the **portSwap** status, or alternately use **portSwapShow**.

The persistent disable configuration overrides existing port configurations, but it does not change these configurations. Use the **portCfgPersistentEnable** command to enable a port persistently and to restore all previously set port configurations for that port. The switch still runs power-on diagnostics and initializes a persistently disabled port. The **portEnable**, **switchEnable**, and **bladeEnable** commands do not enable a specific port or ports alone, but these commands succeed on a switch with one or more persistently disabled ports. The **portEnable** command fails when issued on persistently disabled ports.

The persistent switch disable or enable configuration does not alter the persistent disable or enable configurations of the ports within the switch.

Because ports are by default persistently enabled, the persistently disabled state of a port is cleared by the **portCfgDefault** command.

NOTES

This command is blocked if the switch is operating in the FICON Management Server mode (fmsmode); instead, use **portDisable** with Active=Saved mode enabled.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on FCoE ports. To disable an FCoE port, use fcoe --disable.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be disabled persistently, followed by a slash (/).

port1[-port2]

Persistently disables a single port or a range of ports identified by port numbers. The port range cannot span slots, but you can specify multiple port ranges pairs separated by a space, for example 3/1-4 4/7-9.

-i index1[-index2]

Persistently disables a port or a range of ports identified by port index numbers. You may specify multiple index ranges separated by a space, for example, -i 33-38 40-60.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot [*slot1*[*-slot2*]

Persistently disables all ports on a slot or on a range of slots, for example, **-s** 3-5. You may specify multiple slot ranges separated by a space, for example, **-s** 3-5 8-10

-h

Displays the command usage.

EXAMPLES

To disable a single port persistently:

```
switch:admin> portcfgpersistentdisable 2/4
```

To disable a range of ports persistently:

```
switch:admin> portcfgpersistentdisable 2/4-8
```

To disable multiple port ranges persistently:

```
switch:admin> portcfgpersistentdisable 2/12 \
-15 3/10-12 4/3-4
```

To display the **portSwap** status:

```
switch:admin> portcfgpersistentdisable -i
portcfgpersistentdisable: portSwap feature enabled.
'-i' option not supported.
```

To disable a port persistently by specifying its index number:

```
switch:admin> portcfgpersistentdisable -i 176
```

To disable a range of ports persistently by specifying the corresponding port index range:

```
switch:admin> portcfgpersistentdisable -i 17-18
```

To disable multiple ports persistently by specifying multiple port index ranges:

```
switch:admin> portcfgpersistentdisable -i 17-18 30-39
```

To disable all ports on slots 3-5 persistently:

```
switch:admin> portcfgpersistentdisable -s 3-5
```

To disable all ports on slots 3-5 and 8-10 persistently:

```
switch:admin> portcfgpersistentdisable -s 3-5 8-10
```

To display the persistently disabled ports on the switch:

```
Disabled - YES YES - - - - - - - - - YES YES
Slot 0 32 33 34 35 36 37 38 39
-----
Disabled YES YES YES YES YES YES YES
```

SEE ALSO

ficonCupSet, ficonCupShow, portCfgDefault, portDisable, portEnable, portCfgPersistentEnable, portShow, portSwapDisable, portSwapShow, switchShow

portCfgPersistentEnable

Persistently enables a port or a range of ports.

SYNOPSIS portcfgpersistentenable

portcfgpersistentenable [slot/]port1[-port2] [...]

portcfgpersistentenable -i [index1[-index2] [...] [-f]]

portcfgpersistentenable -s[lot] [s/ot1[-s/ot2]

portcfgpersistentenable -h

DESCRIPTION

Use this command to persistently enable a port or a range of ports. If the port is connected to another switch when this command is issued, the fabric may reconfigure. After the port is persistently enabled, devices connected to the port can again communicate with the fabric.

You can identify a single port to be configured by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use **switchShow** for a listing of valid ports, slots, and port index numbers. When used without operands, this command displays all persistently enabled ports on the switch.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the **portSwap** status, or alternately use **portSwapShow**.

For ports that come online after being persistently enabled, the following indications may be sent to indicate a state transition: RSCN, SNMP trap, Web pop-up window.

Persistently enabled ports remain enabled across power cycles, switch reboots, and switch enables. By default, a port is enabled persistently, unless the port is capable of routing. The change in configuration is effective immediately.

This command re-enables all previously set port configurations of a specified port. You can temporarily disable a persistently enabled port with the **portDisable** or **switchDisable** commands. The persistent switch disable or enable configuration does not alter the persistent disable or enable configurations of the ports within the switch. The configuration commands **configDefault** and **portCfgDefault** do not modify the persistent enable attribute of a port.

NOTES

This command is blocked if the switch is operating in the FICON Management Server mode (fmsmode). Instead use **portEnable** with Active=Saved Mode enabled.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on FCoE ports. To enable an FCoE port, use fcoe --enable.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be enabled persistently, followed by a slash (/).

port1[port2]

Persistently enables a single port or a range of ports identified by port numbers. The port range cannot span slots, but you can specify multiple port ranges pairs separated by a space, for example 3/1-4 4/7-9.

-i index1[-index2]

Persistently enables a port or a range of ports identified by port index numbers. You may specify multiple index ranges separated by a space, for example, 33-38 40-60.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot [slot1[-slot2]

Persistently enables all ports on a slot or on a range of slots, for example, **-s** 3-5.

Multiple slot ranges are not supported with this command.

-h

Displays the command usage.

EXAMPLES

To enable a single port persistently:

```
switch:admin> portcfgpersistentenable 2/4
```

To enable a range of ports persistently:

```
switch:admin> portcfgpersistentenable 2/4-8
```

To enable multiple port ranges persistently:

```
switch:admin> portcfgpersistentenable 2/24-26 3/10-12 4/3-4
```

To enable a port persistently by specifying its index number:

```
switch:admin> portcfgpersistentenable -i 176
```

To enable a range of ports persistently by specifying the corresponding port index range:

```
switch:admin> portcfgpersistentenable -i 17-18
```

To enable multiple ports persistently by specifying multiple port index ranges:

```
switch:admin> portcfgpersistentenable -i 17-18 30-39
```

To enable all ports on slots 3-5 persistently:

```
switch:admin> portcfgpersistentenable -s 3-5
```

To display the persistently enabled ports on the switch:

switch:admin> portcfgpersistentenable

portCfgQoS

Enables or disables QoS, sets the default configuration, and sets and resets the ingress rate limit.

SYNOPSIS

portcfggos --disable | --enable [slot/]port

portcfgqos --setratelimit [slot/]port ratelimit

portcfgqos --resetratelimit [slot/]port

portcfggos --enable | --disable | slot/|port|-port| csctl mode

portcfqqos --default [slot/]port

portcfgqos --help

DESCRIPTION

Use this command to configure traffic prioritization on a port. Two alternate modes of traffic prioritization are supported by this command: Adaptive Networking/Quality of Service (AN/QoS) or Class-Specific Control (CS_CTL):

- The Adaptive Networking with QoS feature allows latency-sensitive applications to share storage resources alongside throughput-intensive applications. You can enable or disable Adaptive Networking/Quality of Service (AN/QoS) on a port, set or reset the ingress rate limit for the specified port, and set the default behavior. Ingress Rate Limiting delays the return of BB credits to the external device. By limiting the throughput on the ingress side of a port, existing congestion can be removed or avoided.
- In Fabric OS v7.0.0 and later, an alternate method of traffic flow prioritization based on the CS_CTL bits of a Fibre Channel frame is provided through this command. This feature uses the value of the CS_CTL bit of the frame to determine the virtual channel (VC), so each frame can be prioritized based on the value of the CS_CTL bit.

CS_CTL flow prioritization is independent of traffic prioritization based on QoS zones; and both methods are mutually exclusive. If CS_CTL VC mode is enabled on an F/FL_Port, QoS-based traffic flow prioritization cannot be used between any two devices connected to these F/FL_Ports in that fabric and vice versa.

If both QoS-based and CS_CTL-based traffic prioritization are enabled on the same F/FL_Port, the CS_CTL-based method takes priority over the QoS zones. When QoS is enabled on an F/FL_Port and you enable CS_CTL VC mode on the same port, the command displays a message stating that QoS zones will lose priority to CS_CTL-based traffic prioritization. When you disable CS_CTL mode on a given F/FL port, the QoS zones, if already enabled, become the effective frame classification method for all devices connected to that F/FL_Port.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Enabling and disabling QOS is potentially disruptive to the I/O on the affected port.

An Adaptive Networking license is required for using this command.

This command is not supported on all platforms. Refer to the *Fabric OS Administrator's Guide* for more information.

The configuration changes effected by this command are persistent across system reboots.

The Fabric OS port configuration commands are not supported on FCoE ports.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to configure,

followed by a slash (/).

port[-port]

Specifies the port or port range to be configured, relative to the slot for bladed systems. Use switchShow for a listing of valid ports. You can specify a port range

only when you configure CS_CTL-based traffic prioritization.

--disable

Disables the current configuration on the specified ports. When issued for a single port, this command disables QoS, which is enabled by default. When issued with the **csctl mode** operand, this command accepts a port range and disables traffic prioritization based on CS_CTL. If QoS was enabled before you enabled **csctl mode**, this command restores QoS-based traffic prioritization.

--enable

Enables QoS or CS CTL mode. When issued for a single port, this command enables QoS. When issued with the csctl_mode operand, this command accepts a port range and enables traffic prioritization based on CS_CTL. If QoS is enabled when you enable csctl_mode, the command displays a message stating that QoS zones will lose priority to CS CTL-based traffic prioritization.

--resetratelimit

Turns off the ingress rate limiting feature on the specified port.

--setratelimit ratelimit

Sets an ingress rate limit to reduce traffic from the specified port. This configuration is applicable only to F/FL_Ports. For E/EX_Ports, this configuration would not be effective. The ingress rate limit is enforced only when a given port can run at a speed higher than the speed specified in the configuration. For example if the rate limit is set at 4 Gbps and the port comes online only at 2 Gbps. no enforcement is needed. Specify an ingress rate in Mbps. Supported values for ratelimit are: 200, 400, 600, 800, 1000, 1500, 2000, 2500, 3000, 3500, 4000, 5000, 6000, 7000, and 8000, 9000, 10000, 11000, 12000, 13000, 14000, 15000, 16000.

--default

Applies the default configuration to the specified port. This command attempts to re-enable QoS; success depends on availability of buffers. If CS CTL was enabled on the port, this command disables the configuration.

--help

Displays the command usage.

EXAMPLES

To enable QoS on a port.

```
switch:admin> portcfgqos --enable 1/15
```

To disable QoS on a port.

```
switch:admin> portcfgqos --setratelimit 12/41 2000
```

To set the default QoS configuration on a port:

```
switch:admin> portcfggos --disable 1/15
```

To set the ingress rate limit on a port to 2 Gbps:

```
switch:admin> portcfgqos --default 12/41
```

To enable CS_CTL VC mode on a port when QoS is enabled.:

switch:admin> portcfgqos --enable 1/10-16 csctl_mode

```
Enabling CSCTL mode flows causes QoS zone flows to \
  lose priority on such ports

To disable CSLT VC mode on a port range:

switch:admin> portcfgqos --disable 1/10-16 csctl_mode

SEE ALSO portCfg, portCmd, portShow, switchShow, configure

portCfgShow

Displays port configuration settings.

SYNOPSIS

portcfgshow

portcfgshow [slot/]port

portcfgshow -i [ndex1[-index2] [...] [-f]]

portcfgshow -slot slot1[-slot2] [...]

portcfgshow option [slot/][ge_port] [arguments]
 [optional_arguments]

DESCRIPTION

Use this command to display the current configuration of a port. The behavior of this command is platform-specific; output varies depending on port type and platform, and not all options are supported on all platforms.

Non-GbE port displays

When used without operands, this command displays port configuration settings for all ports on a switch, except Gigabit Ethernet (GbE) ports.

Displays supported only on the Brocade 7800/FX8-24 and on the Brocade FR4-18i platforms

Use this command with optional arguments to display the following parameters configured for a GbE port on the Brocade 7800/FX8-24 and on the Brocade FR4-18i platforms.

- IP interfaces on the GbE port
- Static routes on the IP interfaces
- Address resolution protocol (ARP) entries
- VLAN tag configuration
- Fibre Channel over IP (FCIP) tunnel configuration settings
 - IPSec configuration
 - QoS mappings (Brocade FR4-18i only)
- Port mode information (Brocade FR4-18i only)

Displays supported only on the Brocade 7800/FX8-24 platforms

Inband Management IP addresses and routes.

Non-GbE port displays

The following information is displayed when the command is issued for all ports, for a single port, or for one or more port ranges specified by their port index numbers or slot numbers:

Area Number

Displays the port area number. This field is displayed only when portCfgShow is executed for a single port.

Speed

Displays Auto for auto speed negotiation mode, or a specific speed of 1, 2, 4, or 8 Gbps. This value is set by the **portCfgSpeed** command.

Fill Word (On Active)

Displays the fill word setting that will take effect after the next time the port goes offline and comes back Possible values are 0(Idle-Idle), 1(arbff-arbff), 2(Idle-arbff), or 3(A-A then SW I-A). This parameter is set by the **portcfgFillword** command.

Fill Word (Current)

Displays the currently effective fill word setting. Possible values are 0(Idle-Idle), 1(arbff-arbff), 2(Idle-arbff), or 3(A-A then SW I-A). This parameter is set by the **portcfgFillword** command.

AL_PA Offset 13

Displays (..) or OFF when the arbitrated loop physical address (AL_PA) on the port is configured to use a 0x0 AL_PA address (default). Displays ON when the address configuration is 0x13 AL_PA. This value is set by the **portCfgAlpa** command.

Trunk Port

Displays ON when port is set for trunking. Displays (..) or OFF when trunking is disabled on the port. This value is set by the **portCfgTrunkPort** command.

Long Distance

Displays (..) or OFF when long distance mode is off; otherwise, displays long distance levels. This value is set by the **portCfgLongDistance** command. Values are as follows:

LE

The link is up to 10 km.

LM

The link is up to 25 km.

L1

The link is up to 50 km.

L2

The link is up to 100 km.

LD

The distance is determined dynamically.

LS

The distance is determined statically by user input.

VC Link Init

Displays (..) or OFF when the long distance link initialization option is turned off. Displays ON when it is turned on for long distance mode. This value is set by the **portCfgLongDistance** command.

Locked L_Port

Displays ON when the port is locked to L_Port only. Displays (..) or OFF when L_Port lock mode is disabled and the port behaves as a U_Port). This value is set by the **portCfgLport** command.

Locked G_Port

Displays ON when the port is locked to G_Port only. Displays (..) or OFF when G_Port lock mode is disabled and the port behaves as a U_Port. This value is set by the **portCfgGport** command.

Disabled E_Port

Displays ON when the port is not allowed to be an E_Port. Displays (..) or OFF when the port is allowed to function as an E_Port. This value is set by the **portCfgEport** command.

ISL R_RDY Mode

Displays ON when ISL R_RDY mode is enabled on the port. Displays (..) or OFF when ISL R_RDY mode is disabled. This value is set by the **portCfgISLMode** command.

RSCN Suppressed

Displays ON when RSCN suppression is enabled on the port. Displays (..) or OFF when RSCN suppression is disabled. This value is set by the **portCfg rscnsupr** command.

Persistent Disable

Displays ON when the port is persistently disabled; otherwise displays (..) or OFF. This value is set by the **portCfgPersistentDisable** command.

LOS TOV enable

Displays ON when LOS TOV is enabled on the port; otherwise displays (..) or OFF. This value is set by the **portCfgLossTov** command.

NPIV capability

Displays ON when N_Port ID Virtualization (NPIV) is enabled on the port (default). Displays (..) or OFF when NPIV capability is disabled. This value is set by the **portCfgNPIVPort** command.

QOS E_Port

Displays ON when Quality of Service (QoS) is enabled on the E_Port (or EX_Port) when QoS is enabled in an FCR deployment scenario. Displays (..) or OFF when QoS is disabled. By default, QoS is enabled if sufficient buffers are available. Displays AE when QoS is configured as Auto Enabled. In the AE state, QoS is enabled based on the availability of buffers.

Use **isIShow** to determine the current status of QoS (on or off) in the AE state. This value is set by the **portCfqQos** command.

EX_Port

Displays ON when the port is configured as an EX_Port. Otherwise displays (..) or OFF. This value is set by the **portCfgExPort** command.

Mirror Port

Displays ON when Mirror Port is enabled on the port. Displays (..) or OFF when Mirror Port is disabled. This value is set by the **portCfg mirrorport** command.

FC Fastwrite

Displays ON when FC FastWrite is enabled on the port or (..) or OFF when disabled. FastWrite is disabled by default. This value is set by the **portCfg fastwrite** FC Fastwrite is no longer supported as of Fabric OS v7.0.0.

Rate Limit

Displays ON when ingress rate limit is set on the port or (..) or OFF when the ingress rate limiting feature is disabled. This value is set by the **portCfgQos** --setratelimit command. The default value is OFF.

Credit Recovery

Displays ON when Credit Recovery is enabled on the port. Displays (..) or OFF when the feature is disabled. This value is set by the **portCfgCreditRecovery** command. The credit recovery feature is enabled by default, but only ports configured as long distance ports can utilize this feature.

Port Auto Disable

Displays On when the Auto Disable feature is enabled on a port. Displays (..) or OFF when the feature is disabled. This feature causes ports to become disabled when they encounter an event that would cause them to reinitialize. This feature is enabled by the **portCfgAutoDisable** command. The feature is disabled by default. In the single port view, the configured trigger conditions are displayed when the feature is disabled. Refer to the example section for an illustration.

F_Port Buffers

Displays the number of configured F_Port buffers. Displays (..) or OFF if no buffers are configured. The buffer value is set by the **portCfgfPortbuffers** command.

NPIV PP Limit

Displays the maximum number of allowed logins for the port. Displays the default

of 126 or the configured maximum. This parameter is set with the

portCfgNPIVPort --setloginlimit command.

CSCTL mode

Displays ON if CSCTL mode is enabled on the port. Displays (..) or OFF if the feature is disabled. This parameter is set with the **portCfqQos** command.

D_Port mode

Displays ON when the port is configured as a D_Port; otherwise displays (..) or OFF. Refer to the **portCfgDPort** command for more information. This parameter is displayed only on on Condor3-based blades that support D_Port capability.

Fault Delay

Displays the Fault delay value. Displays 0 if the value is R_A_TOV. This is the default. Displays 1 if the value is 1.2 seconds. This value is set by the **portCfgFaultDelay** command. valid for FC ports only.

Compression

Displays ON when compression is enabled on a port. Displays (..) or OFF when the configuration is disabled. Compression is enabled by the **portCfgCompress** command; it is disabled by default.

Encryption

Displays ON when encryption is enabled on a port. Displays (..) or OFF when the configuration is disabled. Encryption is enabled by the **portCfgEncrypt** command; it is disabled by default.

FEC

Displays ON when Forward Error Correction (FEC) is enabled on a port and the port is online. Displays (..) or OFF when the configuration is disabled. FEC is enabled by the **portCfgFec** command; it is enabled by default.

When **portCfgShow** is issued for a single FCoE port, only the following fields are displayed: **Area Number**, **Speed Level**, **AL_PA Offset**, **RSCN Suppressed**, and **NPIV PP Limit**. If the command is issued without operands on a DCX with one or more FCOE10-24 blades, the port parameters that are not valid on the FCoE ports are marked with a dash (-). Refer to the example section for an illustration.

You can identify a single port to be displayed by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use **switchShow** for a listing of valid ports, slots, and port index numbers. When used without operands, this command displays all persistently disabled ports on the switch.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the **portSwap** status, or alternately use **portSwapShow**.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The Fabric OS port configuration commands are not supported on FCoE ports.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured, followed by a slash (/).

port

Specifies the number of the port to be displayed, relative to its slot for bladed systems. Use **switchShow** for a listing of valid port numbers.

-i index1[-index2]

Specifies a port or a range of ports identified by port index numbers. You can specify multiple index ranges separated by a space, for example, -i 33-38 40-60.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot slot1[-slot2]

Specifies a slot or a range of slots. You can specify multiple slot ranges separated

by a space, for example, -s 1-3 5-7.

ge_port

Specifies the number of the GbE Port to be displayed. The GbE ports are numbered ge0 - ge9 on the Brocade FX8-24 blade and ge0 - ge5 on the Brocade 7800 switch. The 10GbE ports on the Brocade FX8-24 blade are numbered xge0 and xge1. The GbE ports on the Brocade FR4-18i are numbered ge0 and ge1. Use the **switchShow** command for a list of valid ports.

Use **portCfgShow** with a GbE port or with one of the optional arguments to display specific FCIP-related parameters.

Displays supported on the Brocade 7800/FX8-24 and on the Brocade FR4-18i platforms

The following operands are optional; if omitted, all of the configuration settings are displayed on the FR4-18i platforms, along with the FCIP tunnels. When issued on the Brocade 7800/FX8-24, tunnels and parameters not applicable to these platforms are not displayed. Use the **portShow** command to display FCIP tunnel and circuit parameters on the Brocade 7800/FX8-24.

ipif

Displays the IP interface for both ports of the tunnel. IPv6 addresses are

supported.

iproute

Displays the IP route on the specified GbE port. IPv6 addresses are supported.

arp

Displays the address resolution protocol (ARP) table.

vlantag

Displays the VLAN tagging configuration. For each entry, the output displays the IP interface address, the destination IP address, the VLAN ID, and the L2 CoS priority. This display includes permanent entries only. Permanent entries are configured at the IP interface level with the **portCfg vlantag** command. To view VLAN tagged tunnels and circuits along with permanent entries, use the

portShow vlantag command.

fciptunnel

Displays FCIP tunnels and related parameters. Valid arguments for fciptunnel

include the following:

all

Displays information for all FCIP tunnels.

ve_port

Displays information for the specified FCIP tunnel on the Brocade 7800/FX8-24 (only). To display the tunnel, specify the VE_Port number associated with the tunnel configured on one of the GbE ports. VE_Ports are numbered 16-23 on the Brocade 7800 and 12-31 on the Brocade FX8-24 blade.

tunnel id

Displays information for the specified FCIP tunnel on the Brocade FR4-18i only.

valid tunnel IDs are 0 to 7.

-ipsec

On the Brocade FR4-18i, this option displays IKE and IPSec policy information on IPSec-enabled tunnels. On the Brocade 7800/FX8-24, this option displays whether IPSec is enabled or disabled. If enabled, the key is displayed. If IPSec is enabled and configured in legacy mode, the mode is displayed as "legacy". The mode information is displayed whether or not you issue the **-ipsec** option. This operand is optional.

-gosmap

Displays the VC to QoS mapping. This operand is optional and valid only on the Brocade FR4-18i.

mode

Displays the mode of the specified GbE port as FCIP or not configured This operand is optional and valid only on the Brocade FR4-18i.

Displays supported only on the Brocade 7800/FX8-24platforms.

mgmtif ge_port

Displays the inband management interfaces configured for a specified GbE Port. The display includes the interface status (enabled or disabled), the interface IPv4 Address, the netmask, effective MTU, and annotated port flags.

mgmtroute ge_port

Displays the management routes configured for a specified GbE Port. The display includes the destination IPv4 Address, the netmask, the gateway address, and annotated port flags. The metric field is not valid for the Brocade 7800.

EXAMPLES To display the port configuration settings for a single port on a Brocade DCX 8510-8:

```
switch:admin> portcfgshow 10/38
Area Number:
Octet Speed Combo:
                          1(16G|8G|4G|2G)
Speed Level:
                          AUTO (HW)
AL_PA Offset 13:
                          OFF
Trunk Port
                          ON
Long Distance
                          OFF
VC Link Init
                          OFF
Locked L_Port
                          OFF
Locked G_Port
                          OFF
Disabled E_Port
                          OFF
Locked E_Port
                          OFF
ISL R_RDY Mode
                          OFF
RSCN Suppressed
                          OFF
                          OFF

portCfgSpeed

Configures the speed for a port or a range of ports.

SYNOPSIS

portcfgspeed [slot/]port speed

portcfgspeed -i [index1[-index2] [-f] speed

portcfgspeed -slot [slot1[-slot2] [...] speed

portcfgspeed -h

DESCRIPTION

Use this command to set the speed on a specified port or port range. This command disables and then re-enables the ports, and the ports come online with the new speed setting. The configuration is saved in nonvolatile memory and is persistent across switch reboots or power cycles. Use the **portShow** command to display supported port speed levels. Use the **portCfgShow** command to display configured speed settings.

On Condor 3-based plat forms ,the **portCfgSpeed** command checks if the requested speed is allowed, based on the combination configured for the octet that contains the port. If the speed is not supported by the current octet speed combination, this command exits with a warning message that displays the combination compatible with desired speed. Use the **portCfgOctetSpeedCombo** command to the set the suggested combination before re-executing the **portCfgSpeed** command.

You can identify a single port to be configured by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use **switchShow** for a listing of valid ports, slots, and port index numbers.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the **portSwap** status, or alternately use **portSwapShow**.

NOTES

This configuration cannot be set on VE/VEX_Ports. For a virtual FC port, the speed is always 10 GbE and port speed autonegotiation is not possible.

Speed configuration is not applicable to FCoE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the ports to be configured,

followed by a slash (/).

port

Configures a single port identified by the port number relative to the slot on bladed

systems.

-i index1[-index2]

Configures a port or a range of ports identified by port index numbers. Multiple

port ranges are not supported with this command.

-f

Ignores nonexisting ports. This operand is valid only with the ${\mbox{-}}{\mbox{i}}$ option.

-slot [slot1[-slot2]	
0.01 [0.01.]	Configures all ports on a slot or on a range of slots, for example, -s 3-5. You may specify multiple slot ranges separated by a space, for example, -s 3-5 8-10.
speed	
·	Sets speed for the specified ports. This operand is required. Valid values are one of the following.
0	
	Autosensing mode (hardware). The port automatically configures for maximum speed.
ax	
	Autosensing mode (hardware). The port automatically configures for maximum speed with enhanced retries.
S	
	Auto-sensing mode (software). The port automatically configures for maximum speed with enhanced retries.
1	
	The port is set at a fixed speed of 1 Gbps (not supported on 10G and 16G platforms).
2	
	The port is set at a fixed speed of 2 Gbps.
4	
	The port is set at a fixed speed of 4 Gbps.
8	
	The port is set at a fixed speed of 8 Gbps.
10	
	The port is set at a fixed speed of 10 Gbps (not supported on 8G platforms).
16	
	The port is set at a fixed speed of 16 Gbps (not supported on 8G platforms).
-h	
	Displays the command usage.
To post the amount of a	a month to 40 Ohmo.
To set the speed of a	
switch:admin	> portcfgspeed 2/3 10
To set the speed of a	a port using the port index:
•	
switch.admin	> portcfgspeed -i 78 16
To set the speed of a	a port range using the port index:
switch:admin	> portcfgspeed -i 24-38 8
to set all ports on slo	ots 2 and 3 to 8 Gbps:
switch:admin	> portcfgspeed -s 2-3 8
To set all ports on slo	ots 2-3 and 9-12 to 10 Gbps:

portCfgTrunkPort

Enables or disables trunking on a port.

SYNOPSIS portcfgtrunkport [slot/]port[,] mode

DESCRIPTION

Use this command to enable or disable trunking on a port. Use **switchCfgTrunk** to enable or disable trunking on all ports of a switch.

When the command is executed to update the trunking configuration, the port to which the configuration applies is disabled and subsequently re-enabled with the new trunking configuration. Traffic through the ports may be temporarily disrupted.

Disabling trunking fails if a Trunk Area (TA) is enabled on the port. Use the **portTrunkArea** command to remove the TA before disabling trunking.

NOTES

Enabling trunking requires an ISL Trunking license. You may disable trunking without a license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The Fabric OS port configuration commands are not supported on FCoE ports.

Virtual FC Ports do not support frame-based trunking . If trunking is enabled for one of these ports in a slot, and a Brocade FX8-24 Extension blade is inserted into the slot, the configuration is not honored and the system logs a RASLOG error. An attempt to enable trunking for a Virtual FC port in a slot that contains a Brocade FX8-24 is rejected.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured,

followed by a slash (/).

port

Specifies the port to be configured, relative to its slot for bladed systems. Use

switchShow to display a listing of valid ports.

mode

Specify 1 to enable trunking on the specified port. Specify 0 to disable trunking on the port. This operand is required. Trunking is enabled by default, when a trunking

license is present on the switch.

EXAMPLES To enable a port for trunking:

switch:admin> portcfgtrunkport 1/3, 1

SEE ALSO

portCfgShow, portShow, switchCfgTrunk, portTrunkArea, switchShow

portCfgVEXPort

Configures a port as a VEX_Port connected to an FC-IP and sets and displays VEX_Port configuration parameters.

SYNOPSIS

portcfqvexport [slot/]port

portcfgvexport [-a admin]

portcfgvexport [-f fabricid]

portcfgvexport [-r ratov]

portcfgvexport [-e edtov]

portcfgvexport [-d domainid]

portcfgvexport [-p pidformat]

portcfgvexport [-t fabric_parameter]

portcfgvexport [-m portmode]

DESCRIPTION

Use this command to configure a port as a VEX_Port, to display the port's VEX_Port configuration, or to change the configuration. If no optional parameter is specified, the command displays the currently configured values; otherwise, it sets the specified attribute to its new value. The port must be disabled prior to setting VEX_Port attributes. The port must be enabled before the port can become active following VEX_Port parameter changes. Use portDisable and portEnable to disable or enable the port.

When the port is not active, the preferred domain ID is configurable. The preferred domain ID is used by the VEX_Port's front phantom domain to request a domain ID from the principal switch. The domain ID received becomes the subsequent preferred domain ID, which is persistent and is displayed.

NOTES

The fabric ID must be the same for every router port connected to the same edge fabric, and different for every edge fabric. If two ports are connected to the same fabric but have been assigned different fabric IDs, one of them will be disabled due to a fabric ID oversubscription. If two fabrics have been assigned the same fabric ID, one of them will be disabled due to a fabric ID conflict.

The front domain WWN field displays the WWN of the front domain. If the port is enabled and the state is "OK", the edge fabric principal switch domain ID and WWN also are displayed.

If the Fabric Parameter value is "Auto Negotiate", the port ID format, R_A_TOV, and E_D_TOV values display the negotiated values indicated by "(N)" next to them. The negotiated values are what the edge switch specifies in the ELP request. If the state is "Not OK", R_A_TOV and E_D_TOV display "Not Applicable". By default, all VEX_Ports are auto-ELP enabled.

If the Fabric Parameter attribute value is "User configured", port ID format, R_A_TOV, and E_D_TOV display the configured values.

A configuration change that would result in an invalid domain ID for McDATA Open Fabric mode or McDATA Fabric mode causes the preferred domain ID to be set to the minimum valid McDATA mode domain ID of 1. The exception to this is if the configuration change includes setting the preferred domain ID, in which case the configuration change does not take place and a corresponding error message is displayed.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS This command has the following operands:

-a admin

Enables or disables the specified port as a VEX_Port. Valid values are 1 (enable as VEX_Port), 2 (disable as VEX_Port and enable as non-VEX_Port).

portCfgDefault may also be used to disable VEX_Ports.

-f fabricid

Specifies the fabric ID. Valid values are 1-128.

-r ratov

Specifies the R A TOV used for port negotiation. Valid values are 2000 to 120000. This operand is only applicable if the "Fabric Parameter" attribute value is not "Auto Negotiate".

-e edtov

Specifies the E_D_TOV used for port negotiation. Valid values are 1000 to 60000. This operand is only applicable if the "Fabric Parameter" attribute value is not "Auto Negotiate".

-d domainid

Specify the preferred domain ID. For Brocade native mode (-m 0) or McDATA Open Fabric mode (-m 1), valid values are 1 to 239. For McDATA Fabric mode (-m 2), valid values are 1 to 31.

-p pidformat

Specifies the Port ID format. Valid values are 0-native, 1-core, 2-extended edge. This operand is applicable only when port mode is set to 0 (native mode). If port mode is not "Brocade Native", the Port ID format displays as "Not applicable".

-t fabric_parameter

Enables or disables negotiation of the fabric parameters. Valid values are:

1-enable, 2-disable.

-m port mode

Specifies the Port mode. The -m option enforces the same port mode for all the ports connected to the same edge fabric. If the -m option is selected, the port mode is compared to the online ports. If the modes are different, an error message is displayed, and the command fails. Valid values are as follows:

0

Brocade Native mode.

1

McDATA Open Fabric mode.

2

McDATA Fabric mode.

EXAMPLES

To display the VEX_Port configuration of port 2/16:

switch:admin> portcfgvexport 2/16

Port 2/16 info Admin: enabled State: Pid format: core(N) Edge Fabric ID: 16 Front Domain ID: 160 Front WWN: 50:06:06:9e:20:9f:ce:10

Principal Switch:

principal WWN: 10:00:00:60:69:c0:05:8a

Fabric Parameters: Auto Negotiate R_A_TOV: 9000(N) E_D_TOV: 2000(N)

Edge fabric's primary wwn: N/A Edge fabric's version stamp: N/A

To set the fabric ID of port 2/21 to 5 and the port ID format to core:

```
switch:admin> portcfgvexport 2/21 -f 5 -p 1
```

To configure port 2/20 as a VEX_Port and set the fabric ID to 4:

```
switch:admin> portcfgvexport 2/20 -a 1 -f 4
```

To disable fabric parameter negotiation on port 2/20 of a VEX_Port:

```
switch:admin> portcfgvexport 2/20 -t 2
```

    [-z size] [-v vlan_id [-c L2 Class-of-Service]]
```

```
portcmd --tperf [s/ot/]veport -sink | -source

[-high | -medium | -low][-time duration] [-unidirectional]

[-random] [-pattern pattern] [-size pdu_size]

[-interval interval]
```

DESCRIPTION

Use this command to invoke the end-to-end IP path performance (ipperf) characterization feature, to ping or trace a route to a destination IP host from an intelligent GbE port, or to determine the path characteristics between a local data source and a remote data sink.

The following **portCmd** features are platform-specific:

- IPperf Supported only on the Brocade FR4-18i.
- Tperf Supported only on the Brocade 7800/FX8-24.
- VLAN tagging Supported on the Brocade 7800/FX8-24 and FR4-18i.
- IPv6 Supported on the Brocade FX8-24/7800 and FR4-18i.

When issued with the **--tperf** option, this command determines the path characteristics to a remote host or tunnel destination. TPerf generates statistics every 30 seconds by default unless you specify a different value for **-interval**. The output displays the following information:

Tunnel ID

Numeric identifier for the TPerf tunnel.

Traffic Priority

High, Medium, or Low.

bytes tx

Number of bytes transmitted.

bytes rx

Number of bytes received.

PDUs tx

Number of protocol data units transmitted.

PDUs rx

Number of protocol data units received.

bad CRC headers rx

Number of bad CRC headers received.

bad CRC payloads rx

Number of bad CRC payloads received.

out of seq PDUs rx

Number of out-of-sequence PDUs received.

flow control count

Flow control count.

last rtt

Last Round trip in milliseconds (RT traffic only).

When issued with the **ipperf** option, this command determines characteristics of the path to the remote host. The output of the **--ipperf -S** command includes the following information:

Sampling frequency(s)

The interval specified with the -i option or the default (30 seconds).

Total Time(s)

The time in seconds the command has been running since it was last issued.

BW

The bandwidth measured in the last interval. Bandwidth is defined as the total number of transmitted packets in bytes. BW represents what the FCIP tunnel and the FC application register as throughput rather than the Ethernet on-the-wire bytes.

WBW

The current bandwidth weighted with a gain of 50%.

Loss(%)

The number of TCP retransmits. This number averages the TCP retransmit rate over the last display interval.

Delay(ms)

The smoothed TCP round-trip time and variance estimate in milliseconds.

PMTU

The path maximum transmission unit (MTU) represents the largest IP layer datagram that can be transmitted over the end-to-end path without fragmentation. This value is measured in bytes and includes the IP header and payload. There is limited support for black hole PMTU detection. PTMUs of decreasing size are sent: Jumbo PMTU (greater than 1500 bytes), 1500 bytes, and 1260 bytes, the minimum PMTU supported for FCIP tunnels. If the 1260 PMTU transmission fails, the **--ipperf** command terminates. There is no support for aging. During black hole PMTU detection the BW, WBW, Loss and PMTU values printed may not be accurate.

VLAN tagging ensures that test traffic traverses the same path as real FCIP traffic. A VLAN tag entry must exist prior to issuing the **--ping** or **--traceroute** commands; this includes both the local and remote sides. A VLAN Tag table entry is dynamically maintained by the **ipperf** application.

NOTES The -crc option to portCmd --tperf is no longer supported as of Fabric OS v7.0.0.

End-to-end path characterization is not supported if an IPSec-enabled tunnel exists that uses the same source/local IP address.

Make sure to use the **--ping** and **--ipperf** commands with a double-dash (**--**). If the dashes are omitted, a message displays indicating that the command is deprecated.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be configured, followed by a slash (/).

ge port

Specifies the port number of the GbE port on the blade.

--ipperf

Determines the path characteristics to the remote host. Valid arguments and their values include the following:

-s src_ip

Specifies the local IP address to use for sourcing the probe packets. The **ipperf** command will not start, if an IPSec-enabled tunnel exists that uses the same source IP address. IPv6 addresses are supported.

-d dst_ip

Specifies the destination IP address to which to probe the IP router path. IPv6 addresses are supported.

-S

Instructs the source mode to initiate the TCP connection. The source end-point generates a traffic stream and reports the end-to-end IP path characteristics from this end-point to the receiver end-point sink.

-R

Instructs the sink mode to accept the new connection. The end-to-end path characteristics are not reported.

-i interval

Specifies the intervals between polling and displaying statistics, in seconds. If the duration is greater than **-t** *running_time*, the statistics displays only once, at the conclusion of the test. This operand is optional.

-p port

Specifies the TCP port number for the listener end-point. This operand is optional.

-q diffserv

Specifies the DSCP (DiffServ Code Point) marking used for the TCP connection. This operand accepts values between 0 and 63. The default value is 0. This operand is optional.

-r committed_rate

Specifies a committed rate for the data stream, in Kbps. If specified, the traffic generator is limited by a traffic shaper. This characterizes the end-to-end IP path performance based on the data rate configured for a tunnel between the same end-points. If a rate is not specified, the traffic generator competes for uncommitted bandwidth. This operand is optional.

-t running_time

Specifies total time to run the test traffic stream, in seconds. If not specified, the test runs continuously until aborted with **Ctrl+c**. This operand is optional.

-z size

Specifies the size, in bytes, of the trace route packet to use. The default is 64 bytes. In an IPv4 environment, the ICMP/IP header occupies 28 bytes. In an IPv6 environment, it occupies 48 bytes. The total size, including ICMP/IP headers (28 or 48 bytes without IP options) cannot be greater than the IP MTU configured on the interface. This operand is optional.

-v vlan_id

Specifies the VLAN ID. Values must be in the range between 1 and 4094. There is no default value. Note that a VLAN tag entry must exist on the local and remote sides prior to issuing the -v option. A VLAN Tag table entry is dynamically maintained by the **ipperf** application. See the **portCfg** help page for details on creating a VLAN tag table.

-c L2 Class-of-Service

Specifies Class of Service/Priority, as defined by IEEE 802.1p. Valid values are 0 to 7. The default is 0. This operand is optional with the **-v** option

--ping

Pings a destination IP address from one of the source IP interfaces on the GbE port. Valid arguments and their values include the following:

-s src_ip

Specifies the source IP address that originates the ping request. IPv6 addresses are supported.

-d dst ip

Specifies the destination IP address to which to target the ping request. IPv6 addresses are supported.

-x | -crossport

Specifies the source IP address as a crossport. A crossport is the nonlocal (secondary) XGE port to a VE_Port group that provides failover capabilities for the tunnel configured on the local XGE port. This operand is optional and supported only on the Brocade FX8-24 XGE ports.

-n num_requests

Specifies the number of ping requests. Valid values are 1 to 255. The default is 4. This operand is optional.

-q service_type

Specifies the type of service in the ping request. The default is 0 and service_type must be an integer from 0 to 255. This operand is optional.

-t tt/

Specifies the time to live. Valid values are 1 to 255. The default is 100. This operand is optional.

-w wait_time

Specifies the time to wait for the response of each ping request in milliseconds. The default is 5000 ms and the maximum wait time is 9000 ms (9 seconds). This operand is optional.

-z size

Specifies the default packet size to a fixed size in bytes. The default is 64 bytes. In an IPv4 environment, the ICMP/IP header occupies 28 bytes. In an IPv6 environment it occupies 48 bytes. The total size, including ICMP/IP headers (28 or 48 bytes without IP options) cannot be greater than the IP MTU configured on the interface. This operand is optional.

-v vlan_id

Specifies the VLAN ID. Values must be in the range between 1 and 4094. There is no default value. Note that a VLAN tag entry must exist on the local and remote sides prior to issuing the -v option. A VLAN Tag table entry is dynamically maintained by the ipperf application. See the portCfg help page for details on creating a VLAN tag table.

-c L2 Class-of-Service

Specifies Class of Service/Priority, as defined by IEEE 802.1p. Values must be in the range between 0 and 7. The default is 0. This operand is optional with the **-v** option.

--traceroute

Traces the IP router hops used to reach the host dst_ip from one of the source IP interfaces on the GbE port. Valid arguments include the following:

-s src_ip

Specifies the local IP address to use for sourcing the probe packets. IPv6 addresses are supported.

-d dst_ip

Specifies the destination IP address to which to probe the IP router path. IPv6 addresses are supported.

-x | -crossport

Specifies the source IP address as a crossport. A crossport is the nonlocal (secondary) XGE port to a VE_Port group that provides failover capabilities for the tunnel configured on the local XGE port. This operand is optional and supported only on the Brocade FX8-24 XGE ports.

-h max_hops

Specifies the maximum hop limit used in the outgoing probe packets. The default value is 30 hops. This operand is optional.

-f first ttl

Specifies the starting point for the "time to live" parameter. The default is 1. The command skips processing for those intermediate gateways that are less than the *first_ttl* hops. This operand is optional.

-q service_type

Specifies the type of service in the **traceroute** request. The default is 0 and service_type must be an integer from 0 to 255. This operand is optional.

-w wait_time

Sets the time, in milliseconds, to wait for a response to a probe. The default is 5000 milliseconds. The maximum wait time is 9000 milliseconds (9 seconds). This operand is optional.

-z size

Specifies the size, in bytes, of the trace route packet to use. The default is 64 bytes. In an IPv4 environment, the ICMP/IP header occupies 28 bytes. In an IPv6 environment, it occupies 48 bytes. The total size, including ICMP/IP headers (28 or 48 bytes without IP options), cannot be greater than the IP MTU configured on the interface. This operand is optional.

-v vlan_id

Specifies the VLAN ID. Values must be in the range between 1 and 4094. There is no default value. Note that a VLAN tag entry must exist on the local and remote sides prior to issuing the **-v** option. A VLAN Tag table entry is dynamically maintained by the **ipperf** application. See the **portCfg** help page for details on creating a VLAN tag table.

-c L2 Class-of-Service

Specifies Class of Service/Priority, as defined by the IEEE 802.1p specification. Values must be in the range between 0 and 7. The default value is 0. This operand is optional with the **-v** option.

--tperf

Determines the path characteristics to a remote host or tunnel destination The **-tperf** option requires two separate Brocade FX8-24 blades to function. One blade plays the role of a data sink and the other blade plays the role of the data source. TPerf also requires that you define a tunnel as a TPerf tunnel. Refer to **portCfg fciptunnel** for more information.

-sink | -source

Designates the switch to function either as a data sink or a data source. This operand is required.

When -sink is specified, TPerf begins to respond to traffic sent by the switch acting as the data source. The process continues to run until it is either terminated by user intervention (Ctrl +C) or, if a value for duration is specified with the -t option, until the process completes the set time frame.

The following optional arguments are ignored on the data sink, because it services all requests from the data source: -high, -medium, -low, -unidirectional, -random, -pattern, and -size.

When **-source** is specified, TPerf generates traffic until it is interrupted by user intervention (Ctrl + c) or, if a value for duration is specified with the -t option, until the process completes the set time frame. The TPerf module on the remote host will immediately begin generating traffic; it is therefore imperative that the data sink has been started on the opposing switch before the data source is started on the local switch.

The following arguments are optional:

-hiah

Generates high priority traffic.

-medium

Generates medium priority traffic.

-low

Generates low priority traffic.

If no traffic priority is specified only medium priority traffic is generated.

-time duration

Specifies the duration of the TPerf traffic flow in seconds. If a value for duration is not specified, the process continues to run until it is terminated with Ctrl + C.

-unidirectional

Generates traffic in one direction only. The default is round-trip.

-random

Specifies a random protocol data unit (PDU) size between 2048 and the size of the send request. Refer to -size below.

-pattern pattern

Specifies the test data pattern for the payload as one of the following values:

0 | notspecified

No pattern is specified. TPerf applies whatever is already set or in memory. This is the default value.

1 | allzeros

The specified pattern is "all zeros".

2 | allones

The specified pattern is "all ones".

3 | incrementingbyte

The specified pattern is "incrementing byte".

4 | random

The specified pattern is "random".

5 | jitter

The specified pattern is "jitter".

-size pdu_size

Specifies the PDU size to use (not including headers). The valid range is between 2048 and 10112 bytes. The default is equivalent to the maximum segment size (MSS). This is the maximum size if the **-random** option is specified.

-interval interval

Specifies the interval at which the statistics display is refreshed, in seconds. The default is 30 seconds.

EXAMPLES To verify if packets can be sent to the destination IP address with maximum wait_time specified:

```
switch:admin> portcmd --ping 12/ge0 \
    -s 2007:7:30:32:227:138:10:120 \
    -d 2007:7:30:32:227:77:0:60 -w 29000
Pinging 2007:7:30:32:227:77:0:60 from ip interface \
    2007:7:30:32:227:138:10:120 on 12/ge0 with 64

bytes of data
Reply from 2007:7:30:32:227:77:0:60: bytes=64 rtt=0ms ttl=255
Reply from 2007:7:30:32:227:77:0:60: bytes=64 rtt=1ms ttl=255
Reply from 2007:7:30:32:227:77:0:60: bytes=64 rtt=0ms ttl=255
Reply from 2007:7:30:32:227:77:0:60: bytes=64 rtt=0ms ttl=255
Ping Statistics for 2007:7:30:32:227:77:0:60:
    Packets: Sent = 4, Received = 4, Loss = 0 ( 0 percent loss)
    Min RTT = 0ms, Max RTT = 1ms Average = 0ms
```

To trace the IP router hops used to reach the remote (with packet size specified):

```
switch:admin> portcmd --traceroute 12/ge0 \
    -s 2007:7:30:32:227:138:10:120 \
    -d 2007:7:30:32:227:77:0:60 -z 1452
Traceroute to 2007:7:30:32:227:77:0:60 from IP interface 2007:7:30:32:227:138:10:120 on 12/0, 30
hops max
1 1 ms 0 ms 0 ms
Traceroute complete.
```

To verify if packets can be sent to the destination IP address using VLAN tagging with the -c option.

```
switch:admin> portcmd --ping 8/ge0 \
    -s 192.168.10.1 -d 192.168.20.1 -v 10 -c 3
```

To trace the IP router hops used to reach the remote host using VLAN tagging with the -c option.

```
switch:admin> portcmd --traceroute 8/ge0 \
    -s 192.168.10.1 -d 192.168.20.1 -v 10
```

To ping a failover crossport:

```
switch:admin> portcmd --ping 8/xge0 \
    192.168.11.20 -d 1.1.1.1 -x
```

To trace the route to a failover crossport:

```
switch:admin> portcmd --traceroute 8/xge0 \
192.168.11.20 -d 1.1.1.1 -x
```

To set the path characteristic to source mode on the remote host using VLAN tagging with the **-c** option.

```
switch:admin> portcmd --ipperf 8/ge0 \
     -s 192.168.10.1 -d 192.168.20.1 -s -v 10 -c 3
```

To create a TPerf data sink on VE_Port 16:

```
switch:admin> portcmd --tperf 16 -sink
TPerf has been configured successfully for 16
TPerf is servicing requests on 16 priority: high
TPerf is servicing requests on 16 priority: medium
TPerf is servicing requests on 16 priority: low
Tperf data source can now be started
```

To configure a Brocade FX8-24 blade as a TPerf data source (this example generates round-trip high, medium, and low priority traffic with a fixed PDU size of 2084 bytes. The payload pattern is a jitter pattern and the checksum is checked by the sink):

```
switch:admin> portcmd --tperf 16 -source \
    -size 2048 -pattern 5
TPerf has been configured successfully for 16
TPerf is generating traffic on 16 priority: medium
Tunnel ID: 16
               High Priority Medium Priority Low Priority

switch:admin> portcmd --tperf 16 -source -pattern 5
```

SEE ALSO portCfg, portShow

portDebug

Sets debug level and verbose level of port modules.

SYNOPSIS portdebug dbg_lvl, vbs_lvl

DESCRIPTION Use this command to set the debug level and verbose level of port modules.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

dbg_lvl

Specify the debug level to be set for port modules; valid values are 1 to 5.

vbs_lvl

Specify the verbose level to be set for port modules; valid values are 1 to 5.

EXAMPLES To set debug level and verbose level of port modules:

switch:admin> portdebug 3 4

SEE ALSO dbgShow

portDecom

Decommissions and disables an E_Port without frame loss.

SYNOPSIS portdecom

portdecom [slot/]port

portdecom --help

DESCRIPTION

Use this command to disable an E_Port without frame loss. The E_Port can either be a single redundant E_Port or an E_Port which is part of a trunk group. The port must be an operational E_Port with at least one other redundant E_Port available to reach all domains that the E_Port can reach. Or the port must be an operational E_Port which is part of a trunk group with at least one other member in the trunk. The last member of the trunk group may also be decommissioned, if there are other available redundant E_Ports.

Upon successful completion of the command all traffic flows on the port will have been moved to other redundant paths and the port will be placed in a persistently disabled state. To bring the port back online use the **portCfgPersistentEnable** command.

NOTES

Port decommissioning is not supported on links configured for encryption or compression.

The execution of this command requires that the lossless feature is enabled on both the local switch and the remote switch on the other end of the E_Port. This command will fail for online ports, if the port is not a fully operational E_Port or trunk port, lossless is not enabled on the local or remote switch, or no alternate redundant path is available to route the traffic. A redundant path must be an E_Port connection between the same pair of switches as the E_Port that is being decommissioned. Use the **topologyShow** command to verify that alternate paths are available to reach all domains.

When decommissioning the member of a trunk group, all members must have an equal link cost. If a member does not have an equal cost, the cost of the trunk as a whole may change after decommissioning the port and cause routes to be changed. Refer to the **linkCost** command for more information.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the ports to be disabled,

followed by a slash (/).

port

Specifies the E_Port to be decommissioned.

EXAMPLES To decommission a port

switch:user> portdecom 2/5

The port has been decommissioned and persistently disabled.

SEE ALSO

dlsSet, dlsShow, linkCost, portCfgPersistentEnable, topologyShow

portDisable

Disables a port or a range of ports.

SYNOPSIS

portdisable [slot/]port1[-port2] [...]

portdisable -i [index1[-index2] [...] [-f]]

portdisable -slot [slot1[-slot2] [...]

portdisable -h

DESCRIPTION

Use this command to disable a port or a range of ports. If the port is connected to another switch when disabled, the fabric may reconfigure. Devices connected to this port can no longer communicate with the fabric.

You can identify a single port to be disabled by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use switchShow for a listing of valid ports, slots, and port index numbers.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F Port trunks. Use the -i option without a port index argument to display the portSwap status, or alternately use portSwapShow.

The front panel LED of a disabled port flashes amber in a two-second cycle. If the port was online before being disabled, a state transition will be indicated in one of the following ways: RSCN, SNMP trap, or Web pop-up window.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on FCoE ports. To disable an FCoE port, use fcoe --disable.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be disabled,

followed by a slash (/).

port1[-port2]

Disables a single port or a range of ports identified by port numbers. The port range cannot span slots, but you can specify multiple port ranges pairs separated by a space, for example, 3/1-4 4/7-9.

-i index1[-index2]

Disables a port or a range of ports identified by port index numbers. You may specify multiple index ranges separated by a space, for example, -i 33-38 40-60.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot [slot1[-slot2]

Disables all ports on a slot or on a range of slots, for example, -s 3-5. You may specify multiple slot ranges separated by a space, for example, -s 3-5 8-10.

-h

Displays the command usage.

EXAMPLES To disable a single port.

```
switch:admin> portdisable 2/4
```

To disable a range of ports:

```
switch:admin> portdisable 2/4-8
```

To disable multiple port ranges:

```
switch:admin> portdisable 2/24-26 3/10-12 4/3-4
```

To disable a port by specifying its index number:

```
switch:admin> portdisable -i 176
```

To disable a range of ports by specifying the corresponding port index range:

```
switch:admin> portdisable -i 170-176
```

To disable multiple ports by specifying multiple port index ranges:

```
switch:admin> portdisable -i 30-36 170-176
```

To disable all ports on slots 3-5:

```
switch:admin> portdisable -s 3-5
```

To disable all ports on slots 3-5 and 9-12:

```
switch:admin> portdisable -s 3-5 9-12
```

portDPortTest

Initiates or terminates a D_Port test.

SYNOPSIS portdporttes

portdporttest --start [slot/]port_list

portdporttest --stop [slot/]port_list

portdporttest --show [slot/]port_list | all

portdporttest --help

DESCRIPTION

Use this command to manually terminate or re-initiate testing on a diagnostic port (D_Port). The port must be configured as a D_Port and physically connected to a second D_Port on a remote switch. Refer to the **portCfgDPort** command for more information. The **portdporttest --start** command only needs to be issued on one end of the link.

The D_Port test performs the following diagnostics:

- An electrical loopback test (supported only on 16G SFPs capable of electrical loopback)
- An optical loopback test (supported only on 16G SFPs capable of optical loopback)
- A link traffic test
- A link distance measurement

Use the **--show** option with a port operand to display the test status for the specified ports at any time during the test or after the diagnostics has completed. The command output includes the following information for each configured D_Port:

Port

The port number on the local side of the link

Remote WWN

The world wide node name of the switch on the remote side of the link.

Remote Port

The port number on the remote side of the link

Start time

Date and time of test start

End time

Date and time of test completion

Status

On the link initiator, this field displays the overall test status as PASSED, FAILED, SKIPPED, or NOT STARTED (test in progress). On the link responder, the status

displays PASSED, FAILED, or RESPONDER.

Test

For each sub-test, the command displays the Start time, test result (PASSED, FAILED, RESPONDER, or IN PROGRESS), estimated time in seconds, and diagnostic comments. Comments include the following:

No SFP or chip support

The test result is skipped because the SFP or port is not capable of D_Port functionality.

See remote port results

The test result related to this comment is RESPONDER. The port is in responder state and test results will be available at the initiator port on the remote side of the link

Roundtrip link latency

Displays roundtrip link latency in nanoseconds or unknown when the test is in progress. Roundtrip link latency is the time required for the light to travel from a given port to the port at the remote side of the link and back again.

Estimated cable distance

The estimated physical distance of the interswitch link in meters.

Use the **--show all** command to display the following test summary information:

Port

The port number on the local side of the link

State

The port state: OFFLINE or ONLINE

SFP Capabilities

Electrical loopback (E) or optical loopback (O), or both (E, O)

Test Result

PASSED or FAILED, or RESPONDER (for remote ports)

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is supported only on Fibre Channel ports. SFP's must be Brocade-branded and run Fabric OS v7.0.0 or later.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be configured, followed by a slash (/).

port_list

Specifies one or more ports, relative to the slot on bladed systems. Use **switchShow** for a listing of valid ports. A port list should be enclosed in double quotation marks and can consist of the following:

- A single port, for example, "8" or "5/8" on blades systems.
- A port range where beginning and end port are separated by a dash, for example, "8-13" or "5/8-13" on blades systems. A port range cannot span multiple slots.
- A set of ports separated by spaces, for example "3 5 7 8" or 5/3 5/5 5/7 5/8 on bladed systems.
- A set of ports separated by commas, for example "3,5,7,8" or 5/3,5,7,8 on bladed systems.
- A wildcard '*' indicates all ports. The wild card should be enclosed in single quotation marks.

--start

Initiates the diagnostics on the specified D_Ports.

--stop

Terminates the diagnostics on the specified D_Ports

--show

Displays runtime status and results of the diagnostics.

--help

Displays the command usage.

EXAMPLES To initiate the D_Port test on a single port:

```
switch:admin> portdporttest --start
```

To terminate the D_Port test on a single port:

```
switch:admin> portdporttest --stop
```

To display the runtime status for a single D_Port while the test is in progress:

```
switch:admin> portdporttest --show 42
D-Port Information:

portEnable

Enables a port or a range of ports.

SYNOPSIS

portenable [slot/]port1[-port2] [...]

portenable -i [index1[-index2] [...]] [-f]

portenable -slot [slot1[-slot2]

portenable -h

DESCRIPTION

Use this command to enable a port or a range of ports. If a port is connected to another switch when this command is issued, the fabric may reconfigure. After the port is enabled, devices connected to the port can again communicate with the fabric. The front panel LED of a port that is enabled and online is green.

You can identify a single port to be enabled by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use **switchShow** for a listing of valid ports, slots, and port index numbers.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the **portSwap** status, or alternately use **portSwapShow**.

For ports that come online after being enabled, the following indications might be sent to indicate a state transition: RSCN, SNMP trap, Web pop-up window.

This command fails if the switch is disabled, the port's blade is not fully enabled (faulted, powered off, or disabled), or if the port is persistently disabled.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on FCoE ports. To enable an FCoE port, use fcoe --enable.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies the slot number of the ports to be enabled,

followed by a slash (/).

port1[-port2]

Enables a single port or a range of ports identified by port numbers. The port range cannot span slots, but you can specify multiple port ranges separated by a

space, for example 3/1-4 4/7-9.

-i index1[-index2]

Enables a port or a range of ports identified by port index numbers. You may specify multiple index ranges separated by a space, for example, 33-38 40-60.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot [slot1[-slot2]

Enables all ports on a slot or on a range of slots, for example, **-s** 3-5. Multiple slot

ranges are not supported with this command.

-h

Displays the command usage.

EXAMPLES To enable a single port:

```
switch:admin> portenable 2/4
```

To enable a range of ports:

```
switch:admin> portenable 2/4-8
```

To enable multiple port ranges:

```
switch:admin> portenable 2/24-26 3/10-12 4/3-4
```

To enable a port by specifying its index number:

```
switch:admin> portenable -i 176
portenable: portSwap feature enabled.
```

To enable a range of ports by specifying the corresponding port index range:

```
switch:admin> portenable -i 170-176
portenable: portSwap feature enabled.
```

To enable multiple ports by specifying multiple port index ranges:

```
switch:admin> portenable -i 30-36 170-176
portenable: portSwap feature enabled.
```

To enable all ports on slot 3-5.

```
switch:admin> portenable -s 3-5
```

SEE ALSO

portCfgPersistentDisable, portCfgPersistentEnable, portDisable, portShow, portSwapDisable, portSwapShow, switchShow

portEncCompShow

Displays encryption and compression port configuration details.

SYNOPSIS portenccompshow

DESCRIPTION

Use this command to display a list of ports that can be configured for encryption or compression. The command displays one section per ASIC and the ports configurable for that ASIC. The output includes the following information:

User Port

The port index number of the port to be configured. Use the **switchShow** command to identify the corresponding slot and port number.

Encryption configured

Displays "Yes" if encryption is enabled on the port. Displays "No" if encryption is disabled. This parameter is configured with the **portCfgEncrypt** command.

Encryption active

Displays the port's runtime status. "Yes" indicates that the port is online and enabled for encryption. "No" indicates that the port is enabled for encryption but offline, or not enabled for encryption.

Compression configured

Displays "Yes" if compression is enabled on the port. Displays "No" if compression is disabled. This parameter is configured with the **portCfqCompress** command.

Compression active

Displays the port's runtime status. "Yes" indicates that the port is online and enabled for compression. "No" indicates that the port is enabled for compression but offline, or not enabled for compression.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the port configuration and runtime status of the ports configurable for encryption or compression on a DCX 8510-8:

SEE ALSO portCfgEncrypt, portCfgCompress

portErrShow

Displays a port error summary.

SYNOPSIS

porterrshow

DESCRIPTION

Use this command to display an error summary for all ports. Counts are reported on frames transmitted by the port (Tx) or on frames received by the port (Rx). The display contains one output line per port. Numeric values exceeding 999 are displayed in units of thousands (k), or millions (m) if indicated.

Values for the following parameters are displayed:

frames tx

Number of frames transmitted (Tx).

frames rx

Number of frames received (Rx).

enc in

Number of encoding errors inside frames received (Rx).

crc err

Number of frames with CRC errors received (Rx).

crc g_eof

Number of frames with CRC errors with good EOF received (Rx).

too shrt

Number of frames shorter than minimum received (Rx).

too long

Number of frames longer than maximum received (Rx).

bad eof

Number of frames with bad end-of-frame delimiters received (Rx).

enc out

Number of encoding error outside of frames received (Rx).

disc c3

Number of Class 3 frames discarded (Rx). This counter includes the sum of the following class 3 discard counters reported by the **portStatsShow** command:

er_rx_c3_timeout, er_tx_c2_timeout, er_c2_dest_unreach, and

er_other_disc. Refer to portStatsShow help for a description of these counters.

link fail

Number of link failures (LF1 or LF2 states) received (Rx).

loss sync

Number of times synchronization was lost (Rx).

loss sig

Number of times a loss of signal was received (increments whenever an SFP is

removed) (Rx).

frjt

Number of transmitted frames rejected with F_RJT (Tx).

fbsy

Number of transmitted frames busied with F_BSY (Tx).

c3-timeout tx

The number of transmit class 3 frames discarded at the transmission port due to

timeout (platform- and port-specific).

c3-timeout rx

The number of receive class 3 frames received at this port and discarded at the transmission port due to timeout (platform- and port-specific).

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

This command is not supported on FCoE ports.

OPERANDS

portFencing

Configures the Fabric Watch port fencing feature.

SYNOPSIS

portfencing --show

portfencing --enable

port_type_list | all -area area_list | -area all

portfencing --disable

port_type_list | all -area area_list | -area all

portfencing --help

DESCRIPTION

Use this command to enable or disable the Fabric Watch port fencing feature for specified port types and Fabric Watch areas. Supported port types include E_Ports, optical F_Ports, copper F_Ports, physical ports, and Virtual E_Ports (VE_Ports). You can configure a specified port type or a list of port types to enable port fencing for one or more areas. Use the **all** option to indicate all port types or all areas.

Use the **--disable** option to disable port fencing for the specified areas on all ports of the specified port types. Use the **--show** option to display the configuration. The display includes the configured port types, error types, and port fencing status (disabled or enabled). Port fencing is disabled by default.

Port fencing monitors ports for erratic behavior and disables a port if specified error conditions are met. The **portFencing** command enables and configures the port fencing feature; it does not set the thresholds for port fencing. You must configure port thresholds with the **portThConfig** command before you can enable port fencing.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command requires a Fabric Watch license.

OPERANDS

This command has the following operands:

--show

Displays the port fencing status of all configured port types and area types.

--enable

Enables port fencing for one or more specified port types and areas. Specifying at least one port type and area is required. This command fails if thresholds are not set. Refer to **portThConfig** help for more information.

--disable

Disables port fencing for a specified area on all ports in a port type list. Upon successful execution Fabric Watch ceases monitoring the ports for errors in the disabled area. You must specify at least one port type and area when disabling port fencing.

The following operands are required with the **--enable** and **--disable** options.

```
port_type_list | all
```

Specifies one or more port types for which to enable or disable port fencing. When specifying multiple port types, the list members must be separated by a comma. Alternately, use the **all** option to specify all of the following port types:

e-port

Enables or disables port fencing for all E_Ports.

fop-port

Enables or disables port fencing for all optical F_Ports.

cu-port

Enables or disables port fencing for all copper F_Ports. This operand is supported only on embedded platforms and only on copper ports.

port

Enables or disables port fencing for all physical ports.

-area area | -area all

Specifies one or more Fabric Watch areas to be monitored by the port fencing feature. Areas are not case sensitive. Alternately, use the **all** option to specify all of the following areas:

CRC

Cyclic redundancy check error.

ITW

Invalid word transmission

PΕ

Protocol error

ST

State Change

LR

Link reset

C3TX_TO

Class 3 frame discard due to timeout.

--help

Displays the command usage.

EXAMPLES

To enable port fencing for the CRC area on all E_Ports:

```
switch:admin> portFencing --enable e-port -area crc
```

To enable port fencing for all areas on all E_Ports:

```
switch:admin> portFencing --enable e-port -area all
```

To enable port fencing for the CRC, ITW, and PE areas on all E_Ports:

```
switch:admin> portFencing --enable e-port -area CRC,ITW,PE
```

To enable port fencing for the ST area on all E_Ports and optical F_Ports:

```
switch:admin> portFencing --enable e-port,fopport -area ST
```

To enable port fencing for the ST area on all port types:

```
switch:admin> portFencing --enable all -area ST
```

To display the current port fencing configuration:

switch:adr	min> portFencing	show
Port Type	Area	PF Status
E-port	CRC	disabled
	ITW	enabled
	LR	enabled
	PE	enabled
	ST	enabled
FOP-port	CRC	enabled
	ITW	enabled
	LR	enabled
	C3TX_TO	enabled
	PE	enabled
	ST	enabled
Port	CRC	enabled
	ITW	disabled
	LR	disabled
	C3TX_TO	disabled
	PE	disabled
	ST	disabled

SEE ALSO fwHelp, portThConfig

portFlagsShow

Displays the port status bitmaps for all ports in a switch.

SYNOPSIS portflagsshow

DESCRIPTION Use this command to display the following status for a port:

SNMP

Displays whether the port is online or offline.

Physical

Displays the port physical status. Valid values are In_Sync, No_Light (Condor 2 ports only), and No_SigDet (quad small form-factor pluggables (QSFPs) installed without cables). Refer to switchShow help for more information on these states.

Flags

Displays whether there is an SFP inserted in the port, whether the port is active,

and the port type.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the port status for all ports in the switch:

```
switch:user> portflagsshow
Port SNMP Physical Flags
   U_PORT LOGICAL_ONLINE LOGIN NOELP ACCEPT FLOGI
   1 Online In_Sync PRESENT ACTIVE E_PORT G_PORT \
  U_PORT SEGMENTED CBL_LB LOGIN LED
   2 Offline No_Module PRESENT U_PORT LED
   3 Offline No_Light PRESENT U_PORT LED
   4 Offline No_Module PRESENT U_PORT LED
   5 Offline No_Module PRESENT U_PORT LED
   6 Offline No_Module PRESENT U_PORT LED
   7 Offline No_Module PRESENT U_PORT LED
   8 Offline No_Module PRESENT U_PORT LED
   9 Offline No_Module PRESENT U_PORT LED
  10 Online In_Sync PRESENT ACTIVE F_PORT G_PORT \
  U_PORT LOGICAL_ONLINE LOGIN NOELP ACCEPT FLOGI
  11 Offline No_Module PRESENT U_PORT LED
  12 Offline No_Module PRESENT U_PORT LED
  13 Offline No_Module PRESENT U_PORT LED
  14 Offline No_Module PRESENT U_PORT LED
  15 Offline No_Module PRESENT U_PORT LED
  16 Online In_Sync PRESENT ACTIVE F_PORT G_PORT \
  U_PORT LOGICAL_ONLINE LOGIN NOELP ACCEPT FLOGI
  17 Online In_Sync PRESENT ACTIVE F_PORT G_PORT \
  U_PORT LOGICAL_ONLINE LOGIN NOELP ACCEPT FLOGI
  18 Offline No_Module PRESENT U_PORT LED
```

```
19 Offline No_Module PRESENT U_PORT LED
20 Offline No_Module PRESENT U_PORT LED
21 Offline No_Module PRESENT U_PORT LED
22 Offline No_Module PRESENT U_PORT LED
(output truncated)
```

To display the port status for QSFPs installed without cables (partial output):

```
6 16 Offline No_SigDet PRESENT U_PORT LED
6 17 Offline No_SigDet PRESENT U_PORT LED
6 18 Offline No_SigDet PRESENT U_PORT LED
6 19 Offline No_SigDet PRESENT U_PORT LED
```

To display the port status for QSFPs installed and connected with cables (partial output) :

```
28 Online In_Sync PRESENT ACTIVE E_PORT \
T_PORT T_MASTER G_PORT U_PORT LOGICAL_ONLINE LOGIN LED
6 29 Online In_Sync PRESENT ACTIVE E_PORT T_PORT \
T_MASTER G_PORT U_PORT LOGICAL_ONLINE LOGIN LED
6 30 Online In_Sync PRESENT ACTIVE E_PORT \
T_PORT T_MASTER G_PORT U_PORT
```

SEE ALSO portShow, switchShow

portLedTest

Cycles user port LEDs.

SYNOPSIS

portledtest

[--slot slot number] [-ports itemlist] [-npass count] [-action value]

ceeportledtest

[--slot slot number] [-ports itemlist] [-npass count] [-action value]

DESCRIPTION

Use this command to exercise the user port LEDs in the current switch. When used without a slot or port specifier, all ports are tested. For each port, the command cycles through the ON and OFF state by setting the ATTN LEDs to green for the ON condition and unlighted for the OFF condition. The SPEED LEDs are initially set to black before the test starts. The SPEED LEDs turn green while the test is running.

portLedTest and ceePortLedTest are platform-specific versions of the same test. Use ceePortLedTest on FCoE platforms only. Use fcipLedTest for GbE port testing on the Brocade 7800 and FX8-24. On all other platforms, use portLedTest.

This diagnostic cannot be run on an operational switch. You must disable the switch using the chassisDisable command before you can run this test. After the command completes, the ATTN LEDs flash amber, indicating that the command has finished and exited. Enable the switch using the chassisEnable command to set the ATTN LEDs back to black.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--slot slot

Specifies the slot number on bladed systems. When used without the port option, this option exercises all ports in the specified slot. When used with the port option, only the ports specified for the specified slot are tested.

-ports itemlist

Specifies a list of front-end blade ports to test. Refer to itemList for more information on the itemlist parameter. When specifying a ports on a chassis, the -ports operand must be preceded by the --slot operand. Refer to the example section for an illustration. When used without a port or slot option, all ports are tested.

-npass count

Specify the number of times to perform this test. The default value is 10.

-action action

Specifies the LED color. Valid values include the following:

0

Cycle all Port LEDs.

Turn Port status LED off.

Turn Port status LED amber.

Turn Port status LED green.

Turn Port speed LED green.

Turn Port speed LED amber.

EXAMPLES To test port LEDs:

switch:admin> portledtest --slot 1 -ports 1/1-1/5

This test should NOT be aborted in the middle. If aborted, current blade or the switch (in-case of Pizza box) may become unusable. Reset the blade or the switch to recover.

PASSED.

To test port LEDs on a Brocade 8000 using default values:

switch:admin> ceeportledtest
PASSED.

SEE ALSO fcipLedTest, itemList, switchDisable, switchEnable

portLogClear

Clears the port log.

SYNOPSIS portlogclear

DESCRIPTION

Use this command to clear the port log. It is recommended that you clear the port log before triggering an activity so that the log displays only the log events related to that activity.

If the port log is disabled, portLogClear enables it. The port log is disabled automatically when certain errors occur to allow the collection of all the information needed to understand the cause of the error. When the port log is disabled, the events already present in the log are preserved, but new events are not collected.

The following errors disable the port log:

- FCPH, EXCHBAD
- FCPH, EXCHFREE
- NBFSM, DUPEPORTSCN
- UCAST, RELICPDB

Refer to the Fabric OS Message Reference for more information on these errors.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To clear the port log:

> switch:admin> portlogclear switch:admin> portlogshow port log is empty

SEE ALSO portLogDump, portLogShow

portLogConfigShow

Displays the current port log configuration.

SYNOPSIS portlogconfigshow

DESCRIPTION Use this command to display the current port log configuration.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the current port log configuration:

switch:admin> portlogconfigshow
max portlog entries = 16384

SEE ALSO portLogResize

portLogDisable

Disables the port log facility.

SYNOPSIS portlogdisable

DESCRIPTION Use this command to disable the port log facility.

> **NOTES** The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the port log facility:

switch:admin> portlogdisable

SEE ALSO portLogEnable

portLogDump

Displays the port log without page breaks.

SYNOPSIS portlogdump [count[, saved]]

DESCRIPTION

Use this command to display the port log, listing all entries in the log without page breaks. This command displays the same information as **portLogShow**, but **portLogShow** prompts you to press Enter between each page.

For an explanation of the information displayed by this command, refer to the portLogShow command.

If the port log is disabled while this command is executed, a warning message is displayed. Refer to the **portLogClear** command for more information.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

count

Specifies the maximum number of lines to be displayed. Only the most recent count entries are displayed. This operand is optional.

saved

Specify a nonzero value to display the saved port log from the last switch fault. Refer to **upTime** for conditions that cause a fault. The operand count is ignored when displaying the saved log. This operand is optional.

EXAMPLES

To display 10lines of the portlog on a Brocade DCX:

```
switch:user> portlogdump 10
                event port cmd args
time
          task

SEE ALSO portLogClear, portLogShow, upTime

portLogDumpPort

Displays the port log of a specified port without page breaks.

SYNOPSIS portlogdumpport port_index

DESCRIPTION

Use this command to display the port log for a single port specified by its port index number. The command displays all entries in the log without any page breaks. This command is identical to **portLogShowPort**, except that **portLogShowPort** prompts you to press Enter to display the next page.

Port logs are circular log files in the switch firmware, which can save up to 65,536 entries depending on the hardware platform. Use **portLogConfigShow** to display the current size of the port log. Once the log has reached its maximum size, new entries displace the oldest ones. Port logs capture switch-to-device, device-to-switch, switch-to-switch, some device-to-device1, and control information

If the port log is disabled while this command is executed, a warning message is displayed. Refer to **portLogClear** command for more information.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

port_index

Displays the port log for the a single port specified by its port index number. Use **switchShow** for a listing of valid port index numbers.

EXAMPLES

To display the port log dump for a port:

switch:user> p	portlogdumpp	ort 14									
time											
08:35:27.899	tShell	pstate	14	OL1							
08:35:27.899	tReceive	pstate	14	LR2

portLogEnable

Enables the port log facility.

SYNOPSIS portogenable

DESCRIPTION Use this command to enable the port log facility.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To enable the port log facility:

switch:admin> portlogenable

SEE ALSO portLogDisable

portLogEventShow

Displays information about port log events.

SYNOPSIS portlogeventshow

DESCRIPTION Use this command to display information about the ID associated with the various port log events. The

Disabled field indicates whether the port log for that event ID is disabled (1) or enabled (0).

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display information about port log events:

switch:	switch:admin> portlogeventshow										
ID	Event-Name	Disabled

(output	truncated)										

SEE ALSO portLogTypeDisable, portLogTypeEnable

portLoginShow

Displays port login status of devices attached to the specified port.

SYNOPSIS

portloginshow [slot/]port

DESCRIPTION

Use this command to display port login status received from devices attached to the specified port. For each login, this command displays the following fields:

Type

Type of login can display one of the following:

fd

FDISC, Discover F_Port Service Parameters or Virtual N_Port login.

fe

FLOGI, Fabric Login to Fabric F Port.

ff

PLOGI, Port Login to specific N_Ports or well-known addresses like Name Server.

PID

The 24-bit Port ID of the attached device.

WorldWideName

The port's world wide name.

credit

The credit for this login as appropriate. This is BB (buffer-to-buffer) credit for Flogs

and EE (end-to-end) credit for PLOGIs.

df sz

The default frame size for this login.

cos

Class of Services supported. This can be a combination of the following bits:

4

Class 2 is supported.

8

Class 3 is supported.

Further information about each login is displayed after these columns, including the Port ID of the well-known address or N_Port that was the target of the PLOGI, if applicable.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not applicable to embedded FCoE ports. Use fcoeLoginShow.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to be displayed,

followed by a slash (/).

port

Specify the port for which to display login status information, relative to its slot for

bladed systems. Use **switchShow** for a list of valid ports.

EXAMPLES To display the logins received by Port 23 (revealing one FLOGI (type fe) and two PLOGIs):

```
switch:admin> portloginshow 23
Type PID World Wide Name
                              credit df_sz cos
______
fe 201700 21:00:00:e0:8b:05:a3:c9 3 2048 8 scr=1
ff 201700 21:00:00:e0:8b:05:a3:c9 0 0 8 d_id=FFFC20 ff 201700 21:00:00:e0:8b:05:a3:c9 0 0 8 d_id=FFFFFC
```

SEE ALSO fcpProbeShow, portShow

portLogPdisc

Sets or clears the debug_pdisc_flag.

SYNOPSIS portlogpdisc 0 | 1

DESCRIPTION Use this command to set or clear the debug_pdisc_flag. This command is part of the environmental

monitor. A setting of 1 enables logging of Port Discovery parameters. The PDISC log is disabled by

default.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

0 |1

Specify 0 to clear or 1 to set the debug_pdisc_flag. The default is 0.

EXAMPLES To set the debug_pdisc_flag:

switch:admin> portlogpdisc 1

PDISC log setting = 1

SEE ALSO None

portLogReset

Enables the port log facility.

SYNOPSIS portlogreset

DESCRIPTION Use this command to enable the port log facility.

> **NOTES** Refer to portLogClear for events that may disable the port log facility.

> > The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To enable the port log:

switch:admin> portlogreset

SEE ALSO None

portLogResize

Resizes the port log to include a specified number of entries.

SYNOPSIS portlogresize num_entries

DESCRIPTION Use this command to resize the port log to include a specified number of entries. If the specified number

of entries is less than the already configured port log size, there is no change.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

num_entries

Specifies the number of port log entries. The valid range of values is 32,768 to

13,1072 for the Brocade Encryption Switch, DCX, and DCX-4S. For all other

platforms, the range is 16,384 to 32,768.

EXAMPLES To resize the portlog:

switch:admin> portlogresize 17288

SEE ALSO portLogConfigShow

portLogShow

Displays the port log with page breaks.

SYNOPSIS portlogshow [count[, saved]]

DESCRIPTION

Use this command to display the port log with page breaks. This command displays the same information as portLogDump, but one page at a time.

The port log is a circular log file in the switch firmware which can save up to 65,536 entries depending on the hardware platform. Use portLogConfigShow to display the current port log size. Once the log has reached the maximum size, new entries replace the oldest ones. The port log captures switch-to-device, device-to-switch, switch-to-switch, some device-to-device, and control information.

If the command is executed while the port log is disabled, a warning message is displayed. Refer to the portLogClear command for more information.

For each log entry, the following information is displayed:

Time

Displays the event date and time in milliseconds. The clock resolution is 16

milliseconds.

Task

Displays the name of the task that logged the event or "interrupt" if the event was

logged in interrupt context, or "unknown" if the task no longer exists.

Event

Displays the task event that generated the log entry. Possible events include the

following:

start

A switch start or restart event.

disable

A port is disabled.

enable

A port is enabled.

ioctl

A port I/O control is executed.

Tx

A frame is transmitted (class is indicated).

Rx

A frame is received (class is indicated).

scn

A state change notification is posted.

pstate

A port changes physical state.

reject

A received frame is rejected.

busy

A received frame is busy.

ctin

A CT based request is received.

ctout

A CT based response is transmitted.

errlog

A message is added to the error log.

loopscn

A loop state change notification is posted.

create

A task is created.

debug

Indicates a debug message.

nbrfsm

Indicates a neighbor state transition.

sn

Indicates a speed negotiation state.

fcin

Indicates an incoming Fibre Channel information unit.

fcout

Indicates an outgoing Fibre Channel information unit.

read

Indicates an information unit header log from a read operation.

write

Inidcates an information unit header log from a write operation.

err

Indicates an information unit header log of an FC error frame.

frame

Indicates a Fibre Channel frame payload.

nsRemQ

Indicates an interswitch name server query.

rscn

Indicates a Registered State Change Notification.

xalloc

Allocates an exchange.

xfree

Frees an exchange.

xerr

Indicates an exchange error.

xstate

Indicates an exchange state.

payload

Indicates a frame payload.

Port

Displays the port number that logged the event.

Cmd

Defined by the event. Displays a value defined by the event as follows:

ioctl

I/O control command code.

Tx & Rx

Frame payload size.

scn

New state (see state codes below).

pstate

New physical state (see pstate codes below).

ctin

The CT-subtype:

fc

Simple Name Server.

f8

Alias Server.

ctout

The same as ctin.

errlog

Error level (refer to errShow).

loopscn

The current loop state during loop initialization. Possible values areas follows:

OLP

Offline (disconnected or nonparticipating).

LIP

FL_Port entered INITIALIZING or OPEN_INIT state.

LIM

LISM completed, FL_Port became the loop master.

BMP

Loop init completed, FL_Port in MONITORING state.

OLD

Port transitioned to the OLD_PORT state.

TMO

Loop init times out.

Args

Displays additional information about the event as follows:

start

Start type: 0 = enable ports, 100 = disable ports.

disable

State (refer to state codes).

enable

Mode: 0 normal; nonzero loopback.

Tx & Rx

Header words 0,1,4 (R_CTL,D_ID,S_ID,OX_ID,RX_ID) and the first payload

word.

reject

FC-PH reject reason.

busy

FC-PH busy reason.

ctin

Argument 0 is divided into two 16-bit fields: [A] A bit map indicating whether subsequent arguments are valid (0001 means argument 1 is valid, 0003 means arguments 1 and 2 are valid). [B] The CT-based service command code.

Argument 1 is the first word of the CT payload, if applicable (as specified in [A]). Argument 2 is the second word of the CT payload, if applicable (as specified in [A]).

ctout

Argument 0 is also divided into two 16-bit fields: [A] a bit map indicating whether subsequent arguments are valid (0001 means argument 1 is valid, 0003 means arguments 1 and 2 are valid). [B] the CT command code indicating whether an accept (8002) or a reject (8001). If [B] is an accept, argument 1 and 2 represents the first and second words of the CT payload, if applicable (as specified in [A]). If [B] is a reject, argument 1 contains the CT reject reason and explanation code.

errlog

Error type (refer to errShow).

loopscn

The meaning further depends on each loop state:

OLP

Offline reason code, usually zero.

LIP

Reason code for LIPs initiated by FL_Port, if the code value is 800x (x = [1,0xc], see below), or the lower two bytes of the LIP received, if the code value is other than 800x.

LIM

Usually zero.

BMP

Memory address for the loop bitmap.

OLD

Usually zero.

TMO

Encoded value of the state when loop initialization timed out This value is usually equal to the first word of a loop init frame payload. Other possible values include the following:

2

LIP (req. INITIALIZING) timeout.

94

F0F0 ARB(F0) timeout.

40

CLS timeout.

Codes used in various fields are as follows:

state

Valid state values include the following:

1

Online

2

Offline

3

Testing

	4	Faulty							
	5	E_Port							
	6	F_Port							
	7	Segmented							
psi	tate								
	AC	Valid pstate values include the following:							
	LR1	Active State							
	LR2	Link Reset: LR Transmit State							
	LR3	Link Reset: LR Receive State							
	LF1	Link Reset: LRR Receive State							
		Link Failure: NOS Transmit State							
	LF2	Link Failure: NOS Receive State							
	OL1	Offline: OLS Transmit State							
	OL2	Offline: OLS Receive State							
	OL3	Offline: Wait for OLS State							
LIF	P reason	Valid LIP reason codes include the following:							
	8001	Retry loop init.							
	8002	Start loop after gaining sync.							
	8003	Restart loop after port reset.							
	8004								
	8005	LIP when a loop hangs.							
	8006	Restart loop if LIP received when sending out ARB(F0).							
	8007	LIP when an OPN returns.							
	8008	Restart loop when LIPs received in OLD_PORT AC state.							
		Restart loop if loop not empty but E_Port loopback.							

8009

LIP as requested by the LINIT ELS received.

800a

LIP as requested by the LPC ELS received.

Speed Negotiation States

Valid states include the following:

INIT

Start negotiation.

NM

Negotiate master.

WS

Wait for signal.

NF

Negotiation follows.

NC

Negotiation complete.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

switch:user> portlogshow 24

count

Specifies the maximum number of lines to display. Only the most recent count entries are displayed. This operand is optional.

saved

Specifies a nonzero value to display the saved port log from the last switch fault. Refer to upTime for a list of conditions that cause a fault. The count is ignored when the saved log is displayed. This operand is optional.

EXAMPLES To view the port log for a port:

	<u>.</u>				
time			_		d args
		_	_		
17:05:30.384	PORT	Rx	0	40	02fffffd,00fffffd,08fbffff,14000000

SEE ALSO portLogClear, portLogDump, upTime

portLogShowPort

Displays the port log of a specified port with page breaks.

SYNOPSIS portlogshowport port_index

DESCRIPTION

Use this command to display the port log of a specified port with page breaks. This command displays the same information as **portLogDumpPort**, except that **portLogDumpPort** does not prompt you to press Enter to display the next page.

If the command is executed while the port log is disabled, a warning message is displayed. Refer to the **portLogClear** command for more information.

NOTES

Refer to the portLogShow command for a description of the data returned by this command.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

port_index

Displays the port log for a single port specified by its port index number. Use **switchShow** for a listing of valid port index numbers.

EXAMPLES

To display the port log for port 14:

switch:user>	portlogshowpo	ort 14			
time		_			_
08:35:28.483	tFabric	scn	14	0	
08:35:27.899	tShell	pstate	14	OL1	
08:35:27.899	tReceive	pstate	14	LR2	
08:35:27.916	tReceive	pstate	14	AC	
08:35:28.416	interrupt	scn	14	1	
08:35:28.433	tFabric	ioctl	14	90	101d9910,0
08:35:28.433	tFabric	Tx	14	164	\
02fffffd,	00fffffd,000	5ffff,10	0000	00	
08:35:28.433	tReceive	Rx	14	0	\
cOfffffd,	00fffffd,000	50006			
08:35:28.433	tReceive	Rx	14	164	\
03fffffd,	00fffffd,000	50006,02	0000	00	
08:35:28.433	tTransmit	Tx	14	0	\
cOfffffd,	00fffffd,000	50006			
08:35:28.433	tFabric	ioctl	14	91	103646d8,0
08:35:28.433	tFabric	ioctl	14	92	103646d8,0
08:35:28.466	tFabric	ioctl	14	a7	3c,1
08:35:28.466	tFabric	pstate	14	LR1	
08:35:28.466	tReceive	pstate	14	LR3	
08:35:28.466	tReceive	pstate	14	AC	
(output trunc	ated)				

SEE ALSO portLogClear, portLogDumpPort, portLogShow, upTime

portLogTypeDisable

Disables the port log of a specified type.

SYNOPSIS portlogtypedisable id

DESCRIPTION Use this command to disable the port log for a specified port log type.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

Specifies a nonzero value that corresponds to the port log type to be disabled. Use portLogEventShow for a listing of values corresponding to supported log

types.

EXAMPLES To disable logging of type 2 port log events:

switch:admin> portlogtypedisable 2

SEE ALSO portLogDisable, portLogEventShow, portLogTypeEnable

portLogTypeEnable

Enables the port log of a specified port log type.

SYNOPSIS portlogtypeenable id

DESCRIPTION Use this command to enable the port log for a specified port log type.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

id

Specifies a nonzero value that corresponds to the port log type to be enabled. Use **portLogEventShow** for a listing of values corresponding to supported log types.

EXAMPLES To enable logging of type 2 port log events:

switch:admin> portlogtypeenable 2

SEE ALSO portLogEventShow, portLogTypeDisable

portLoopbackTest

Performs a functional test of port N->N path.

SYNOPSIS

portloopbacktest

[--slot slot]
[-nframes count]
[-lb_mode mode]
[-spd_mode mode]
[-ports itemlist]

ceeportloopbacktest

[--slot slot] [-nframes count] [-lb_mode mode] [-spd_mode mode] [-ports itemlist]

DESCRIPTION

Use this command to verify the functional operation of the switch.

The portLoopbackTest and ceePortLoopbackTest commands are platform-specific versions of the same test. The portLoopbackTest command is supported on all Goldeneye2 and Condor-based platforms. Use ceePortLoopbackTest on FCoE platforms only. On all other platforms, use portLoopbackTest. Refer to the Fabric OS Troubleshooting and Diagnostics Guide, Appendix A, for a table that correlates ASIC type with switch models.

This test sends frames from a given port's transmitter and loops them back into the same port's receiver. The loopback is done at the parallel loopback path. The path traversed in this test does not include the media or the fiber cable. Only one frame is transmitted and received at any given time. An external cable is not required to run this test. The port LEDs flicker green rapidly while the test is running.

The test performs the following operations:

- 1. Sets all ports for parallel loopback.
- 2. Creates a frame F of maximum data size (2,112 bytes).
- 3. Transmits the frame F through port N.
- Picks up the frame from the same port N.
- Checks if any of the following eight statistic error counters report nonzero values:
 ENC_in, CRC_err, TruncFrm, FrmTooLong, BadEOF, Enc_out, BadOrdSet, DiscC3
- 6. Checks whether the transmit, receive, or class 3 receiver counters are stuck at some value.
- Checks whether the number of frames transmitted is not equal to the number of frames received.
- Repeats Steps two through seven for all ports until one of the following conditions is met:
 - a. The number of frames (or pass count) requested is reached.
 - b. All ports are marked bad.

At each pass, the frame is created from a different data type of a palette of seven. If seven passes are requested, seven different data types are used in the test. If eight passes are requested, the first seven frames use unique data types, and the eighth is the same as the first. The seven data types are:

```
CSPAT: 0x7e, 0x7e, 0x7e, 0x7e, ...

BYTE_LFSR: 0x69, 0x01, 0x02, 0x05, ...

CHALF_SQ: 0x4a, 0x4a, 0x4a, 0x4a, ...

QUAD_NOT: 0x00, 0xff, 0x00, 0xff, ...

CQTR_SQ: 0x78, 0x78, 0x78, 0x78, ...

CRPAT: 0xbc, 0xbc, 0x23, 0x47, ...

RANDOM: 0x25, 0x7f, 0x6e, 0x9a, ...
```

NOTES

Do not abort this test prematurely, using **CTRL-C** or **q** to quit. Doing so may cause the test to report unexpected errors.

This command does not support High Availability (HA).

The Brocade DCX series cannot negotiate speeds of 1 Gbps.

This diagnostic cannot be run on an operational switch. You must disable the switch using the **chassisDisable** command before you can run this test. After the test completes, re-enable the switch using the **chassisEnable** command. Do not use the **switchDisable** command followed by manually shutting down the ports before running the test. This will not work because executing **switchEnable** after the test completes will leave the ports in the same state as before. The only way to bring the ports down before running the test and back up after the test completes is by using the **chassisDisable** command followed by the **chassisEnable** command.

The Brocade FCoE10-24 blade (ceePortLoopbackTest) supports only lb_mode 1, 2, and 8.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--slot slot

Specifies the number of the slot on which to run the diagnostics. All eligible ports relative to the slot number are tested. The default is 0 and designed to operate on fixed-port-count products.

-nframes count

Specifies the number of frames to send. The test progresses until the specified number of frames has been transmitted on each port. The default value is 10.

-lb_mode mode

Specifies the loopback mode for the test. By default, this test uses the internal loopback. Valid values depend on the platform on which the command is executed. Unsupported values are rejected with an appropriate message.

1

Port Loopback (loopback plugs)

2

External (SERDES) loopback

5

Internal (parallel) loopback

7

Backend bypass & port loopback

8

Backend bypass & SERDES loopback (supported only on a chassis)

-spd_mode mode

Specifies the speed mode for the test. This parameter controls the speed at which each port is operated.

DIAGNOSTICS

EXAMPLES

PASSED.

0 Runs test at 1 Gbps, 2 Gbps, 4 Gbps, and 8 Gbps on 8 G ports. Runs test at 16 Gbps on 16 G ports. 1 Runs test at 1 Gbps (deprecated). 2 Runs test at 2 Gbps. 4 Runs test at 4 Gbps. 8 Runs test at 8 Gbps (Default for 8 G platforms). 10 Runs test at 10 Gbps (Default for 10 G platforms). 16 Runs test at 16 Gbps (Default for 16 G platforms). -ports itemlist Specifies a list of blade ports to test. By default, all of the blade ports in the specified slot (--slot) are used. See itemList for more information on the itemlist parameter. When it detects failures, the test may report one or more of the following error messages. If errors persist, contact Technical Support. DATA Data received does not match the data sent. **ERRSTAT** Errors were found in the ASIC statistics. INIT Port failed to initialize. **PORTDIED** A previously initialized port went to an uninitialized state. **STATS** Errors were found in the ASIC statistics. **TIMEOUT** Did not receive a frame in the given timeout period. **XMIT** Frame transmission failure. To run a functional test in default mode: switch:admin> portloopbacktest Running portloopbacktest

To run a functional test on a Brocade 8000:

SEE ALSO itemList

portMirror

Adds, deletes, or displays port mirror connections.

SYNOPSIS

portmirror

portmirror --show

portmirror --add [slot/|port SID DID

portmirror --delete SID DID

DESCRIPTION

Use this command to add, delete, or display a mirror connection between two ports, a source and a destination port. When used without operand, this command displays the usage.

Port mirroring allows you to configure any switch port in such a way that it will mirror the traffic passing in both directions between a specified source port (SID) and a destination port (DID) back to the configured mirror port. You can use this feature to troubleshoot Fiber Channel end-to-end link communications.

The port mirroring feature mirrors only those frames to the mirror port that contain the specified SID/DID. It does not mirror all frames transmitted or received for a given port. This restriction allows a single mirror port to mirror multiple mirror connections.

The SID must be located in the same domain where the mirror port is configured. The following configurations are supported.

- SID, DID and mirror port reside in the same blade.
- SID, DID and mirror port reside in the same switch (standalone platform).
- SID, DID and mirror port reside in different blades in the same chassis.
- SID, DID and mirror port reside in two different chassis or standalone switches connected through interchassis or interswitch links.

The DID can be either on the local switch or on a different switch. Any given SID can participate in either one or a maximum of three mirror connections, depending on the switch configuration and switch model associated with the SID.

Port mirroring makes use of ASIC resources, and the behavior of this command is therefore dependent on the hardware platform on which the feature is configured. Refer to the Fabric OS Troubleshooting and Diagnostics Guide for information on the following topics:

- Platforms that support the port mirroring feature
- Supported mirror connection maximums for each platform
- Platform-specific feature restrictions
- Special configuration considerations and configuration scenarios

A mirror connection may be rejected because of an invalid configuration, an unavailability of resources, duplicate entries, a mirror port that is not configured, or an offline connection port.

When issued with the **--show** option, this command displays the following information:

Mirror Port

The port number of the mirror port that mirrors the traffic between a SID and a DID.

SID

Source Port ID.

DID

Destination Port ID.

State

The state of the mirror connection. The state can either be "Defined" or "Enabled." In both cases, the port mirroring connection is persistently stored. A connection that is "Defined" has not been hardware-configured because at least one port is not online. A connection that is "Enabled" has been configured in the hardware.

You must enable port mirroring on the port before you can configure mirror connections for that port. Use **portcfg mirrorport --enable** to enable a port for port mirroring. Use the **portCfgShow** command to display all mirror ports on a switch. The **switchShow** command displays the configured port as "Mirror Port".

Use the **portPerfShow** command to display the total number of transmitted and received bytes for each port. In the case of a mirror port, this command shows twice the amount of traffic, because the mirror port transmits and receives the frames.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The port mirroring feature is not supported on all platforms. Refer to the *Fabric OS Administrator's Guide* for more information.

The port mirroring feature is supported in Virtual Fabric mode so long as the FC Routing service is not enabled on the logical switch. Use the **fosConfig** command to disable the FC Routing service.

The Brocade 300, 5300, and most embedded switches can participate only in one mirror connection. All other platforms support up to three mirror connections. These limitations hold regardless of whether Virtual Fabrics are enabled or disabled.

When in-order deliver (IOD) is enabled, deleting a mirror connection can cause frame loss between the SID and DID. If IOD is disabled, deleting a mirror connection may introduce an "order of delivery" error between the SID and DID.

Port mirroring is not supported over FCIP links (VE tunnels) or on Condor 3 FC ports that have encryption or compression enabled.

OPERANDS

This command has the following operands:

--show

Displays all configured mirror connections.

--add

Adds a mirror connection between a source port and a destination port.

slot

For bladed systems only, specifies the slot number of the port to be configured,

followed by a slash (/).

port

Specifies the number of the port to be configured, relative to its slot for bladed systems. This port is the mirror port, in which the mirror traffic is shown. Use **switchShow** for a listing of valid ports.

SID

Specifies the 3-byte source ID of the originator device in "0xDDAAPP" format, where DD is the Domain ID, AA is the Area ID and PP is the AL_PA ID. For example, 0x050200 has a domain ID of 5, an area ID of 2, and an AL_PA ID of 0. The values for the *SID* and the *DID* cannot both be 0x000000.

DID

Specifies the 3-byte DID destination ID of the destination device, in "0xDDAAPP" format, where DD is Domain ID, AA is Area ID and PP is AL_PA ID. For example, 0x050200 has a domain ID of 5, an area ID of 2 and an AL_PA ID of 0. The values for the *SID* and the *DID* cannot both be 0x0000000.

--delete

Deletes a mirror connection between a source and a destination. You must specify a SID and a DID when deleting a mirror connection.

EXAMPLES To configure a port as a mirror port:

```
switch:admin> portcfg mirrorport 18--enable
Please confirm enable of Mirror Port: 17 (Y,y,N,n): [n] y
```

To verify that port mirroring is enabled on port 18:

```
switch:admin> portcfgshow 18
Area Number:
Speed Level:
                        AUTO (HW)

```

To add three mirror connection between three local device port pairs to mirror port 18:

```
switch:admin> portmirror --add 18 0x640c00 0x640800
switch:admin> portmirror --add 18 0x640700 0x640b00
switch:admin> portmirror --add 18 0x640700 0x640c00
```

To display the mirror connections:

```
switch:admin> portmirror --show
```

Number of mirror connection(s) configured: 3

Mirror_Port	SID	DID	State		
18	0x640c00	0x640800	Enabled		
18	0x640700	0x640b00	Enabled		
18	0×640700	0x640c00	Enabled		

To delete a port mirror connection between two local switch ports:

```
switch:admin> portmirror --delete 0x640700 0x640c00
```

To add a port mirror connection between a local switch port and a remote switch port:

```
switch:admin> portmirror --add 2/1 0x011400 0x240400
```

To delete a port mirror connection between a local switch port and a remote switch port:

```
switch:admin> portmirror --delete 0x011400 0x240400
```

SEE ALSO portCfg, portCfgShow, switchShow

portName

Assigns or displays port names.

SYNOPSIS

portname

portname [slot/]port [-n name]

portname -i [index1[-index2][...][-f] [-n name]]

portname -slot slot1[-slot2] [...][-n name]

portname -h

DESCRIPTION

Use this command to assign a port name to a specified port or to a range of ports. The port name is included in the **portShow** output; it should not be confused with the world wide port name.

When a port name is not configured, the **portName** command displays a default name in the **portShow** output. The format of the default name is as follows:

- On standalone platforms, the default port name displays as portportnumber, for example, "port10."
- On enterprise-class platforms, the default port name displays as slotslotnumberportportnumber, for example, "slot1por5."

You can identify a single port to be configured by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use **switchShow** for a listing of valid ports, slots, and port index numbers. When issued without the name operand, this command displays the names of the specified ports or of all ports, if no port is specified.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the **portSwap** status, or alternately use the **portSwapShow** command.

Like all other configurable port attributes, port names persists across reboots and power cycles. They are not affected by the **configDefault** command, but they are cleared by **portCfgDefault**.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the ports to be configured,

followed by a slash (/).

port

Assigns a name to a single port identified by its port number.

-i index1[-index2]

Assigns a name to a single port or to a range of ports identified by port index numbers, for example, -i 1/3-8 -n backup. You may specify multiple index ranges

separated by a space, for example, -i 35-45 61-68 -n backup.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot [slot1[-slot2]

Assigns a name to all ports on a slot or on a range of slots, for example, **-s** 3-5 -n backup. Multiple slot ranges are not supported with this command.

762

-n name

Specifies the name to be assigned to the ports. The port name is a character string up to 128 characters, including spaces and characters, and excluding commas (,), semicolons (;), backlashes (\), and the at sign (@). To erase a port name, specify this operand as an empty string in double-quotation marks. If the name includes spaces it must be included in double quotation marks. This operand is optional; if omitted, the current port name is displayed.

Some characters require a qualifier or double quotation marks when used with a bash shell; for example, enter a single quotation mark as \', enter an exclamation mark as \!, or enter a pipe (|) as "|".

-h

Displays the command usage.

EXAMPLES To name a port tape drive 8:

```
switch:admin> portname 1/3 -n "Tape drive 8"
switch:admin> portname 1/3
Tape drive 8
```

To assign a name to a range of ports specified by port index numbers:

```
switch:admin> portname -i 22-26 -n backup
switch:admin> portname -i 22-26
port 22: backup
port 23: backup
port 24: backup
port 25: backup
port 26: backup
```

To assign a name to all ports on slot 1 and 2:

```
switch:admin> portname -s 1-2 -n backup
switch:admin> portname -s 1-2
port 416: backup
port 417: backup
port 418: backup
port 420: backup
port 421: backup
(output truncated)
```

SEE ALSO configDefault, portCfgDefault, portShow, portSwapDisable, portSwapShow, switchShow

portPerfShow

Displays port throughput performance.

SYNOPSIS portperfshow

portperfshow [[slot/]port1[-[slot/]port2]]
 [-tx -rx | -tx | -rx] [-t interval]]

portperfshow --help

DESCRIPTION

Use this command to display throughput information for all ports on a switch or chassis or to display the information for a specified port or port range. Output includes the number of bytes received and transmitted per interval. Throughput values are displayed as either bytes, kilobytes (k), megabytes (m), or gigabytes (g). Values are rounded down.

The data is displayed one column per port plus one column that displays the total for these ports. Results display every second or over a specified interval. Press **Enter**, **Ctrl-c**, or **Ctrl-d** to terminate the command. To run this command one time only, specify an interval of zero.

When executed with the command line arguments -tx, -rx, or -tx -rx, this command displays the transmitter throughput, the receiver throughput, or both. For ports with status of "No_Module,""No_Light," or "No_SigDet" throughput is displayed as 0.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When FastWrite or Tape Pipelining is enabled, the **portPerfShow** VE link output is different. The acceleration entity (FastWrite or Tape Piplelining) responds by sending XFER_RDY and status well ahead of the actual device's response to the host. The host sends data which is stored near the device and is delivered to the device only when the device is ready. Consequently, the data may be stored near the target for some brief period of time. In this case, the **portPerfShow** output on the VE link may not match the output on the device port.

OPERANDS

This command has the following optional operands:

[slot/]port1[-[slot/]port2]

Displays throughput information for a single port or for a range of ports, relative to the slot number on bladed systems. Port numbers in a range must be separated by a dash (-), for example, 3-5, or 2/0-2/15. Port ranges cannot span slots. Use **switchShow** to display a listing of valid ports. Port operands are optional; if omitted, information for all ports is displayed.

-t time_interval

Specifies the interval, in seconds, between each sample. The default interval is one second. If no interval is specified, the default is used. To run this command one time only, specify an interval of zero.

-tx

Displays the transmitter throughput.

-rx

Displays the receiver throughput.

-tx -rx

Displays the transmitter and receiver throughput.

EXAMPLES To display performance information for all ports at a one second (default) interval:

swit	ch:u	ser	> po	rtp	erfsl	now											
()	1	2	3	4	5	6	7	8	9		10	11	12	13	14	15

32				35							otal						
0 (outp	0	0		0	0		0	0	0		2.5g						

To display performance on a single port with at a 5 second interval:

```
switch:user> portperfshow 0 -t 5
 0
      Total
==========
630.4m 630.4m
       Total
===========
630.3m 630.3m
(output truncated)
```

To display transmitter throughput for a single port at a 5 second interval:

```
switch:user> portperfshow 0 -tx -t 5
  Ω
_____
210.1m
  Λ
=======
210.1m
(output truncated)
```

To display receiver throughput for a single port at a 5 second interval:

```
switch:user> portperfshow 0 -rx -t 5
 0
======
420.3m
 0
======
420.2m
(output truncated)
```

To display port performance on a chassis for range of ports at an interval of 5 seconds:

```
switch:user> portperfshow 12/0-12/6 -t 5
  0 1 2 3 4 5 6 Total
______
slot 12: 840.6m 0 0 0 0 630.4m 1.4g
0 1 2 3 4 5 6 Total

0 1 2
        3 4 5 6 Total
______
slot 12: 840.6m 0 0 0 0 630.4m
(output truncated)
```

SEE ALSO portStatsShow

portRouteShow

Displays routing tables for the specified port.

SYNOPSIS portrouteshow [slot/]port

DESCRIPTION

Use this command to display the port address ID for a specified port and the contents of the following port routing tables:

External unicast routing table

Displays how the specified port forwards unicast frames to remote domains in the following format: domain_number: ports_bitmap

domain_number

The remote domain ID to which frames are ultimately routed.

ports_bitmap

The port number on the ASIC pair to which frames for the domain ID forward in bitmap hex format; for example, 0x0100 indicates port 8 on the ASIC pair. The arrangement of ports on an ASIC pair is specific to the system type. For any active port, this table contains at least one entry, which routes unicast frames destined to the embedded port (value 0x10000) of the local domain.

Internal unicast routing table

Displays how the specified port forwards unicast frames to a locally attached NX Port in the following format: area number: ports bitmap

area_number

The area number of a device (or set of looped devices) attached to the local switch.

ports_bitmap

The format of *ports_bitmap* is the same as the one used in the external unicast routing table.

Broadcast routing table

Displays how the specified port forwards broadcast frames. There is one bit map entry in this table, similar to the bit maps in the other tables; however, this table typically has only Bit 16 set (value 0x10000), indicating this port always routes broadcast frames to the embedded port, for handling by the firmware.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to display, followed by a slash (/).

port

Specifies the number of the port to display, relative to its slot for bladed systems.

EXAMPLES To display the routing tables for a port:

```
switch:user> portrouteshow 4/15
port address ID: 0x02bf00
external unicast routing table:
   1: 0x4 (vc=3)
  2: 0x10000 (vc=0)
internal unicast routing table:
  60: 0x8000 (vc=2)
  63: 0x1000 (vc=5)
broadcast routing table:
  0x10000
```

SEE ALSO bcastShow, fabricShow, switchShow, topologyShow, uRouteShow

portShow

Displays status and configuration parameters for ports and GbE ports.

SYNOPSIS

portshow [slot/][ge]port

portshow -i [index1 [-index2] [...]] [-f]

portshow option [slot/]ge_port [optional_args]

portshow option [all | ve_port] arguments
 [optional_arguments]

portshow option [all |ge_port] arguments
 [optional_arguments]

DESCRIPTION

Use this command to display general port status and specific configuration parameters for a specified port, GbE port, or VE_Port.

If this command is executed for a specified port with no additional options, it displays general status and configuration for that port. If executed with optional arguments for a Gigabit Ethernet (GbE) port or VE_Port, the command displays FCIP-related port configuration parameters specific to the Brocade 7800/FX8-24 and the Brocade FR-18i platforms.

The behavior of this command is platform-specific in command syntax and behavior, and you must use this command in a manner that honors these differences Some command options are not available on all platforms. Others behave differently depending on the platform on which they are executed.

Platform-specific commands are documented in separate sections that include function, synopsis, description, operands, and examples. Use the following section headings to navigate this page.

- General port status display commands supported on all platforms
- Port display commands supported only on the Brocade 7800/FX8-24 and on the Brocade FR4-18i platforms
 - **- portshow ipif** Displays the local IP interfaces.
 - portshow arp Displays the content of the address resolution protocol (ARP) table.
 - portshow iproute Displays static routes on the IP interface.
 - portshow vlantag Displays the IP interface VLAN configuration.
- Commands supported only on the Brocade 7800 and the Brocade FX8-24
 - portshow fciptunnel Displays Fibre Channel over IP (FCIP) tunnels.
 - portshow fcipcircuit Displays FCIP circuits.
 - portshow mgmtif Displays the inband management interfaces.
 - portshow mgmtroute- Displays the routes for the inband management interfaces.
 - portShow xtun Displays FICON and FCP emulation statistics and current runtime conditions.
- Commands supported only on the Brocade FR4-18i
 - portshow fciptunnel Displays Fibre Channel over IP (FCIP) tunnels.
 - portshow mode Displays GbE port mode.
 - portcfg ficon Displays FICON emulation parameters.

To display command usage on the switch, use ${\bf portShow}\ [{\it action}].$

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Some of the features supported by this command may require a license.

In an AD context, if one of the L_Ports or NPIV ports is a part of the current AD, the complete device information attached to the port is shown in the output.

FUNCTION General port status display commands supported on all platforms

SYNOPSIS portshow [slot/][ge]port

portshow -i [index1[-index2] [...]] [-f]

DESCRIPTION

Use this command to display general port status and configuration parameters for the specified port. This command is valid on all platforms, but the output is platform-specific and not all fields are displayed on all platforms.

The following general information is displayed when the command is issued for a non-GbE port without additional arguments:

portIndex

Index number assigned to the port.

portName

Name assigned to the port by the **portName** command. On standalone platforms, the default port name is the port number, for example, "port5". On enterprise-class platforms, the default port name is a combination of the slot number and the port number, for example, "slot1port5".

portHealth

Current health of the port (requires a Fabric Watch license).

Authentication

Authentication type and associated parameters (if applicable) used on the port at

port online.

None

No authentication was performed.

FCAP

FCAP authentication was performed.

DHCHAP

DHCHAP authentication was performed. Also displays DH group and hash type

used for authentication.

portDisableReason

Provides an explanation for the port's disabled status, if it has not been disabled

by portDisable or portCfgPersistentDisable.

portCFlags

Port control flags.

portFlags

A bit map of port status flags, including information on the type of port, whether it is fully online, and whether logins have been accepted. The port flags display ENCRYPT if the port has been enabled for encryption. The port flags display COMPRESS if the port has been enabled for compression. The port flags display

D_PORT if the port has been enabled as a diagnostic port.

portType

The port's type and revision numbers.

POD Port

Port on Demand License status.

portState

The port's SNMP state:

Online

Up and running.

Offline

Not online, see portPhys for more detail.

Testing

Running diagnostics.

Faulty

Failed diagnostics.

Persistently Disabled

Persistently disabled.

Protocol

Protocol used by the port: FC or FCoE.

portPhys

The port's physical state:

No_Card

No interface card present.

No_Module

No module (GBIC or other) present.

No_Light

Module is not receiving light (Condor 2 ports only).

No_SigDet

No signal detected; displays when a quad small form-factor pluggables (QSFPs)

is installed without cables).

 Mod_Inv

Incompatible vendor or module speed mismatch.

No_Sync

Receiving light but out of sync.

In_Sync

Receiving light and in sync.

Laser_Flt

Module is signaling a laser fault.

Port_Flt

Port marked faulty.

Diag_Flt

Port failed diagnostics.

Lock_Ref

Locking to the reference signal.

portScn

The port's last State Change Notification.

port generation number

The port's generation number for the last offline state change.

portId

The port's 24-bit port ID.

portlfld

The user port's interface ID.

portWwn

The port's world wide name.

portWwn of devices(s) connected

The World Wide Port Names of connected devices.

Distance

The port's long-distance level. In the case of LD mode, the user configured distance and actual distance also are displayed. See **portCfgLongDistance** for information on long distance levels.

Port part of other AD

Yes or No.

portSpeed

The port's fixed speed (1, 2, 4, or 8 Gbps) or negotiated speed (N1 Gbps, N2

Gbps, N4 Gbps, N8 Gbps or AN).

FEC

Forward error correction (FEC) status: displays "active" if FEC is enabled on the port and the port is online; displays "inactive" if the feature is disabled. Refer to the

portCfgFec command for more information.

LE domain

The LE domain ID.

FC FastWrite

The status of FC FastWrite (ON or OFF) (Deprecated).

If the port is configured as an EX_Port, the following additional port information is displayed:

EX_Port Mode

The port is configured as an EX_Port.

Fabric ID

The fabric ID assigned to this EX_Port; this is the fabric ID of the edge fabric attached to this EX_Port.

Front Phantom

Information on the front phantom domain presented by this EX_Port. Includes the preferred (if not active) or actual (if active) domain ID for the front domain and the WWN of the front domain.

Pr Switch Info

Information on the principal switch of the edge fabric attached to this EX_Port. Includes the domain ID and WWN of the principal switch.

BB XLate

Information on the xlate (translate) phantom domain presented at this port. Includes the preferred (if not active) or actual (if active) domain ID for the xlate phantom domain and the WWN of the xlate phantom domain. The xlate phantom domain connected at this port is in the same fabric as the router and represents the edge fabric connected to the EX_Port.

Authentication Type

Displays NONE or DH-CHAP. DH-CHAP is the only authentication type supported on EX Ports.

53-1001764-01

2

DH Group

Displays DH group [0-4] if DH-CHAP authentication is used. Otherwise displays

N/A.

Hash Algorithm

Displays hash type (MD5 or SHA-1) if DH-CHAP authentication is used.

Otherwise, displays N/A.

Edge fabric's primary WWN

If the EX_Port is connected to an edge switch with FCS policy enforcement, the WWN of the primary FCS is displayed when the edge fabric is secure and the

primary FCS is online. Otherwise, displays "No Primary".

Edge fabric's version stamp

If the EX_PORT is connected to an edge switch with FCS policy enforcement, the

version of the security database is displayed. Otherwise displays N/A.

The **portShow** command displays FCoE ports with "Protocol: FCoE" and "portSpeed: 10Gbps". Only a subset of information is displayed. Refer to the Examples section for an illustration. Use **fcoe --cfgshow** and **fcoe --loginshow** to display FCoE-specific configuration details.

Following the general information, the command displays three columns of counters. The first column shows interrupt statistics:

Interrupts

Total number of interrupts.

Unknown

Interrupts that are not counted elsewhere.

Lli

Low-level interface (physical state, primitive sequences).

Proc_rqrd

Frames delivered for embedded N_Port processing.

Timed_out

Frames that have timed out.

Rx_flushed

Frames requiring translation.

Tx_unavail

Frames returned from an unavailable transmitter.

Free_buffer

Free buffer available interrupts.

Overrun

Buffer overrun interrupts.

Suspended

Transmission suspended interrupts.

Parity_err

Central memory parity errors.

2_parity_err

Secondary transmission parity errors.

CMI_bus_err

Control message interface errors.

The second column displays link error status block counters.

The third column shows the number of F_RJTs and F_BSYs generated. For L_Ports, the third column also displays the number of loop initialization protocols (LIPs) received, number of LIPs transmitted, and the last LIP received.

OPERANDS This command has the following port operands:

slot

For bladed systems only, specifies the slot number of the port to be displayed,

followed by a slash (/).

port

Specifies the number of the port to be displayed, relative to its slot for bladed

systems. Use switchShow for a listing of valid port numbers.

-i index1[-index2]

Specifies a port or a range of ports identified by port index numbers. You can specify multiple index ranges separated by a space, for example, 33-38 40-60. Port indexes are supported only if PortSwap is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the portSwap status, or alternately use portSwapShow.

EXAMPLES To display the current state of a D_Port:

CMI_bus_err: 0

```

FUNCTION Port display commands supported only on the Brocade 7800/FX8-24 and on the Brocade FR4-18i

SYNOPSIS portshow *option* [*slotl*]*ge_port* [*optional_args*]

DESCRIPTION

Use this command to display FCIP-related configuration parameters on the Brocade 7800/FX8-24 and on the Brocade FR4-18i blade. The parameters displayed by this command are set with the **portCfg** command. The following displays are supported with this command:

- portshow ipif Displays the local IP interfaces.
- portshow iproute Displays static routes on the IP interface.
- portshow arp Displays the content of the address resolution protocol (ARP) table.
- portshow vlantag Displays the IP interface VLAN configuration.

NOTES IPv6 addresses are supported.

OPERANDS This co

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be displayed, followed by a slash (/).

ge_port

Specifies the number of the GbE port to be displayed relative to the slot number. The GbE ports are numbered ge0 - ge9 on the Brocade FX8-24 blade and ge0 - ge5 on the Brocade 7800 switch. The 10GbE ports on the Brocade FX8-24 blade are numbered xge0 and xge1. Use the **switchShow** command for a listing of valid ports

ipif

Displays the IP interface ID, IP address, netmask, and MTU for IPv4 addresses. Displays the prefix instead of the netmask for IPv6 addresses. Flags are explained in the command output (refer to the example below).

iproute

Displays the IP address, netmask, gateway, metrics, and flags. Displays the prefix instead of the netmask for IPv6 addresses. A status flag for the IP routes indicates if a route is used for the management interfaces. A route definition that uses one of the internal interfaces has the words "Interface Management" printed at the end of the line.

arp

Displays the address resolution protocol (ARP) table. On the 7800/FX8-24 platform you can display the content of the ARP table, but you cannot modify its contents. On the FR4-18i you can add static ARP entries using the **portcfg arp** command.

-Imac

Displays the local MAC address. This operand is optional.

vlantag

Displays the VLAN Tagging configuration. For each entry, the output displays the IP interface address, the destination IP address, the VLAN ID, the L2 CoS priority, and a flag. This display includes tunnel- and IPIF-level configurations. The following flags indicate the type of configuration:

Perm

Permanent entry. Permanent entries are configured at the IP interface level with the **portCfg vlantag** command.

Perm Net

Network-wide permanent entry. The same as the permanent entry except that no destination address was defined (defaults to 0.0.0.0), so traffic to all destinations is tagged.

App

Application layer VLAN configuration defined at the circuit level.

EXAMPLES To display the IP interface and static route configured on Brocade 7800:

switch:admin> portshow ipif ge0

Port: ge0 Interface	IPv4 Address	NetMask	Effe	ective MTU	Flag	gs
0		255.255.255.0 255.255.255.0	1500 1500	-	U R U R	
Interface	IPv6 Address		Len	Effective	MTU	Flags
2 3 4 5	fe80::205:left 2000::20 2000::21 2000::22	f:fec3:e6b2	64 64 64 64	1500 1500 1500 1500		URM URM URM URM

Flags: U=Up B=Broadcast D=Debug L=Loopback P=Point2Point R=Running N=NoArp PR=Promisc M=Multicast S=StaticArp LU=LinkUp

switch:admin> portshow iproute ge0

Port: ge0 IP Address	Mask	Gateway	Metric	Flags
192.42.0.0	255.255.255.0	192.168.0.250	0	U G
192.168.0.0	255.255.255.0	*	0	UC
192.168.0.10	255.255.255.255	*	0	UHL
192.168.0.11	255.255.255.255	*	0	UHL
192.168.0.21	255.255.255.255	*	0	UC
192.168.0.250	255.255.255.255	*	0	UHL
IPv6 Address	Len Gateway		Metric	Flags
2000::	64 *		0	U C
2000:: 2000::10				
	64 *		0	U C
2000::10	64 * 128 *		0 0	U C U H L
2000::10 2000::11	64 * 128 * 128 * 128 *	::1:250	0 0 0	U C U H L U H L
2000::10 2000::11 2000::1:250	64 * 128 * 128 * 128 *		0 0 0 0	U C U H L U H L U H L
2000::10 2000::11 2000::1:250 2001::	64 * 128 * 128 * 128 * 64 2000		0 0 0 0 0	U C U H L U H L U H L U G

Flags: U=Usable G=Gateway H=Host C=Created(Interface) S=Static L=LinkLayer(Arp)

To display the IP interface and static route configured for failover crossports on the Brocade FX8-24:

switch:admin> portshow ipif 1/xge0

Port:	1/xae0

Interfa	ce IPv4 Address	NetMask	Effective MT	U Flags	
0	192.168.10.10	255.255.255.0	1500	U R M	
1	192.168.22.100	255.255.255.0	1500	URM	
2	192.168.22.102	255.255.255.0	1500	URM	
3	192.168.31.100	255.255.255.0	1500	URM	
4	192.168.31.102	255.255.255.0	1500	URM	
5	192.168.12.101	255.255.255.0	1500	URM	(crossport)
6	192.168.12.103	255.255.255.0	1500	URM	(crossport)
7	192.168.21.101	255.255.255.0	1500	URM	(crossport)
8	192.168.21.103	255.255.255.0	1500	URM	(crossport)
9	192.168.10.12	255.255.255.0	1500	U R M	(crossport)

Flags: U=Up B=Broadcast D=Debug L=Loopback P=Point2Point R=Running N=NoArp PR=Promisc M=Multicast S=StaticArp LU=LinkUp

switch:admin> portshow iproute 1/xge0

IP Address	Mask	Gateway	Metric	Flags
192.168.10.0	255.255.255.0	*	0	U C
192.168.22.0	255.255.255.0	*	0	U C
192.168.22.102	255.255.255.255	*	0	υC
192.168.22.200	255.255.255.255	*	0	UHL
192.168.31.0	255.255.255.0	*	0	U C
192.168.31.102	255.255.255.255	*	0	U C
192.168.31.200	255.255.255.255	*	0	UHL
192.168.10.0	255.255.255.0	*	0	U C (cross
192.168.12.0	255.255.255.0	*	0	U C (cross

192.168.12.103	255.255.255.255	*	0 υ	C	(crossport)
192.168.12.201	255.255.255.255	*	0 U	Η	L (crossport)
192.168.21.0	255.255.255.0	*	0 U	С	(crossport)
192.168.21.103	255.255.255.255	*	0 U	С	(crossport)
192.168.21.201	255.255.255.255	*	0 U	Η	L (crossport)

To display the ARP tables on the Brocade 7800:

switch:admin> portshow arp ge0

Port: ge0		
IP Address	Mac Address	Flags
192.168.0.10	00:05:1e:c3:f0:1a	Resolved
192.168.0.11	00:05:1e:c3:f0:1a	Resolved
192.168.0.250	00:00:00:00:00:00	
2000::10	00:05:1e:c3:f0:1a	Resolved
2000::11	00:05:1e:c3:f0:1a	Resolved
2000::1:250	00:00:00:00:00:00	
	_	

switch:admin> portshow arp ge5

No Arp Entries found

To display the VLAN tagging configurations on a Brocade 7800:

switch:admin> portshow vlantag ge0

Port: ge0 Interface Address		VlanId	L2CoS	Flags
	Destination Address			J
fe80::205:1eff:feef:22	00	55	0	APP
fe80::205:1eff:feef:22	2002:2055::1 00	55	0	APP
	2002:2050::112			
2002:2055::143	2002:2055::1	55	0	APP
2002:2055::143	2002.20331	55	0	Perm
	2002:2050::112			

FUNCTION Commands supported only on the Brocade 7800 and the Brocade FX8-24

SYNOPSIS portshow option [all | [slot/]ve_port]] arguments [optional_arguments]

DESCRIPTION

Use this command to display configuration parameters and status information for FCIP tunnels and FCIP circuits on the GbE/10GbE ports on the Brocade 7800 and FX8-24 platforms. The FCIP tunnels on the local and remote GbE ports act as Virtual E_Ports (VE_Ports) connecting the local and remote fabrics. The following display options are supported on these platforms:

- portShow fciptunnel Displays Fibre Channel over IP (FCIP) tunnels including the following:
 - Additional performance information
 - FICON configuration parameters
 - IPSec status (enabled or disabled), mode (legacy if configured) and key
 - Circuits with the tunnel
 - QoS statistics including performance for each priority
 - FCIP Tunnel hierarchy listing circuit IDs and TCP connection information for the tunnel

- portShow fcipcircuit Displays status and configuration for FCIP circuits:
 - TCP statistics for the circuit
 - Circuit-level VLAN tagging configuration
 - Circuit-level Differentiated Services (DSCP) markings
- portshow mgmtif Displays the inband management interfaces.
- portshow mgmtroute- Displays the routes for the inband management interfaces.
- portShow xtun Displays FICON and FCP emulation statistics and current runtime conditions.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the VE_Port to be displayed, followed by a slash (/).

ve_port

Displays information for a single specified FCIP tunnel. On the Brocade 7800/FX8-24, specify the VE_Port number associated with the tunnel configured on one of the GbE ports. VE_Ports are numbered 16-23 on the Brocade 7800 and 12-31 on the Brocade FX8-24 blade.

all

Displays information for all configured FCIP tunnels.

fciptunnel

Displays configuration and status per FCIP tunnel. The following operands are supported with **fciptunnel** and **fcipcircuit**.

-c | --circuit

Displays the FCIP circuits within the tunnel. This operand can be used with any other operand to include circuit displays.

-t | --tcp

Displays the TCP statistics for the circuit. The -c option must be specified with this option.

-p | --perf

Displays additional performance information for the specified FCIP tunnels.

-q | --qos

Displays the QoS statistics including performance for each priority. This operand is optional with the **--perf** option.

-i | --ipsec

Displays IPSec status (enabled or disabled) and key if enabled. If IPSec is enabled and configured in legacy mode, the mode information is displayed in parenthesis. This option is valid for **portShow fciptunnel** only.

-h | --hier

Displays the FCIP tunnel hierarchy listing basic circuit IDs and TCP connection information for the tunnel.

-s | --summary

Displays a summary view of the tunnel configuration parameters for a specific VE_Port. You can use the summary option with the **-perf** and the **- qos** option. When used with the **-perf** option, the summary option forces the **--circuit** option. Flags indicate ipsec-configured tunnels, legacy ipsec tunnels, and compression mode. Circuit flags indicate vlan tagging, crossport configuration, and ipv4 or ipv6 configuration.

-d | --detail

Displays a full view configuration details for all configured tunnels when used with the **all** port specifier. This view provides an alternative to specifying a specific VE_Port or to using the **--perf** option for a comprehensive view.

-I | --ip-address

Displays the IP addresses configured the specified circuits. You must use this option with either the **--summary** or the **--circuit** option.

fcipcircuit

Displays FCIP circuit configuration and status. The following operands are supported with **portShow fcipcircuit**:

circuit_ID

Specifies a single circuit within the FCIP tunnel. The circuit ID is an integer value between 1 and 19 on the Brocade FX8-24 and 1 and 7 on the Brocade 7800. This operand is required.

-t | --tcp

Displays the TCP statistics for the specified circuit.

-p | --perf

Displays additional performance information for the specified FCIP circuit.

-q | --qos

Displays the QoS statistics including performance for each priority. This operand is optional with the **--perf** option.

mgmtif

Displays the inband management interfaces configured for a specified GbE Port or for all GbE Ports. For each GbE Port, the display includes the interface status (enabled or disabled), the interface IPv4 Address, the netmask, effective MTU, and annotated port flags.

mgmtroute

Displays the management routes configured for a specified GbE Port or for all GbE Ports. For each GbE Port, the display includes the destination IPv4 Address, the netmask, the gateway address, and annotated port flags. The metric field is not valid for the Brocade 7800.

xtun

Displays FICON and FCP emulation statistics and current runtime conditions for a specified set of parameters. The following arguments are supported:

-fcp

Displays the SCSI FastWrite/Tape Pipelining command sub-menu when issued with a VE_Port number. The syntax for **-fcp** is as follows:

portshow xtun [slot/]\ve_port-fcp [level] [command] [param] [options]

The following optional operands are supported with **-fcp** to display FCP emulation statistics and status information:

-help

Displays the command usage. You must specify a VE_Port number to display the help functions, for example: **portshow xtun 7/12 -fcp -help**.

level

Specifies the level for which information is displayed. You can specify one or more of the following levels. With each additional level, this command generates progressively more information.

-port

Displays data at the port level.

-it

Displays data at the Initiator Target (SID/DID) FCP level.

-itn

Displays data at the Initiator Target nexus (SID/DID) level.

-itl

Displays data at the Initiator Target LUN (SID/DID/LUN) level.

-twb

Displays data at the Exchange (SID/DID/LUN/Exchange) level.

command

Specifies the type of information to be displayed. This operand is optional; if omitted, the default (**-stats**) is used. You can specify more than one command option. Valid commands include the following:

-stats

Displays FCP emulation statistics. This is the default display.

-info

Displays general FCP emulation information.

-cfg

Displays the FCP emulation configuration.

-dump

Displays a raw data dump including data for all information types.

param

Limits output to one or more of the following parameters, given the commands and levels specified with this command. This operand is optional; if omitted, output for all parameters is displayed. There is no default

parameter.

-sid SID

Displays output for the specified SID only.

-did DID

Displays output for the specified DID only.

-lun LUN

Displays output for the specified LUN only.

-timer

Displays timer information only.

options

Affects all levels and commands globally. Only one option is supported.

-zero

Displays zero-valued statistics. Note that some commands may show zero-valued information regardless of whether or not this option is specified.

-ficon

Displays sub-menu for FICON emulation display commands when issued with a VE Port number. The syntax for **-ficon** is as follows:

portshow xtun [slot/]ve_port -ficon [command] [options]

The following optional commands are supported with **-ficon**; if omitted, the usage for all parameters is displayed. The **xtun -ficon** command options include displays for all types of FICON Emulation.

-help

Displays the command usage. You must specify a VE_Port number to display the help functions, for example, **portshow xtun 7/12 -ficon -help**.

-stats

Displays global FICON Emulation statistics for the tunnel including FICON XRC Emulation, FICON Tape Write, FICON Tape Read, FICON Teradata

Write, and FICON Teradata Read statistics.

-fdpb adrs

Displays FICON ports or a specific FICON Device Path Block.

-fchb adrs

Displays FICON logical partitions (LPARs) or a specific FICON Channel

Control Block.

-fcub adrs

Displays FICON images (the same output as with -images) or a specific

FICON Control Unit Block.

-images

Displays FICON images.

-fdcb adrs

Displays FICON devices or specific FICON Device Control Block.

-tapeperf

Starts the emulated Tape Read and Write performance monitor or displays

the performance statistics.

when you first issue this command or any other performance monitor commands after a reboot, the command starts the performance monitor, takes a snapshot of current statistics, and saves them with a time stamp. When you issue the command again, it displays the time elapsed between the two iterations of the command and the average time delta statistics. A new time stamp and current statistics are saved as a basis for the next

iteration.

-teraperf

Starts the emulated Teradata performance monitor or displays the

performance statistics.

-printperf

Starts the emulated Printer performance monitor or displays the performance

statistics.

-xrcperf

Starts the emulated XRC performance monitor or displays the performance

statistics.

-structs

Displays FICON control block sizes.

-emul

Displays comprehensive FICON emulation statistics. Use one of the following

options to display emulation statistics about a specific component.

-emulxrc

Displays FICON XRC emulation statistics.

-emultape

Displays FICON Tape emulation statistics.

-emultera

Displays FICON Teradata emulation statistics.

-emulprint

Displays FICON Printer emulation statistics.

-act

Displays the current Active Exchange information.

options

The following additional option is supported.

-clear

Resets the specified statistics. This operand is optional; it requires a

preceding command.

-mem adrs length

Specifies the SE memory length in words to display. The valid range for *length* is 0

to 1024.

-dram2

Display the current usage of the dynamic memory allocator.

-pools

Display the current free pool allocation (FPA) buffer usage.

-tcb

Displays tunnel statistics.

-drshow

Displays the current Descriptor Ring status

-smem

Displays the current Shadow Memory data.

-rte

Displays the current Routing Info SE memory.

EXAMPLES To display FCIP tunnel configuration parameters on the Brocade 7800 with Ficon enabled:

```
switch:admin> portshow fciptunnel 16
Tunnel ID: 16
  Tunnel Description:
  Admin Status: Enabled
  Oper Status: Up
  Compression: On (Aggressive)
  Fastwrite: Off
  Tape Acceleration: Off
  TPerf Option: Off
  IPSec: Disabled
  QoS Percentages: High 50%, Med 30%, Low 20%
  Remote WWN: Not Configured
  Local WWN: 10:00:00:05:1e:a5:54:bd
  Peer WWN: 00:00:00:00:00:00:00
  Circuit Count: 4
  Flags: 0x00000000
  FICON: On
     FICON XRC: Off
     FICON Tape Write: On
     FICON Tape Read: On
     FICON TinTir Emul: On
      FICON Dvc Acking: On
      FICON Read BLK-ID: On
      FICON Teradata Write: On
     FICON Teradata Read: On
      Tape Write Pipe: 63
      Tape Read Pipe: 65
     Tape Write Devs: 32
```

```
Tape Read Devs: 32
Tape Write Timer: 300
Tape Max Chain: 3200000
FICON OXID Base: 0x8000
FICON Debug Flags: 0xf7c90000
```

To display an FCIP tunnel with FICON disabled:

```
switch:admin> portshow fciptunnel 16
______
Tunnel ID: 16
  Tunnel Description:
  Admin Status: Enabled
  Oper Status: Up
  Compression: On (Aggressive)
  Fastwrite: Off
  Tape Acceleration: Off
  TPerf Option: Off
  IPSec: Disabled
  QoS Percentages: High 50%, Med 30%, Low 20%
  Remote WWN: Not Configured
  Local WWN: 10:00:00:05:1e:a5:54:bd
  Peer WWN: 00:00:00:00:00:00:00
  Circuit Count: 4
  Flags: 0x00000000
  FICON: Off
```

To display an FCIP tunnel with additional circuit information:

```
switch:admin> portshow fciptunnel 1/12 -c
Tunnel ID: 1/12
  Tunnel Description:
  Admin Status: Enabled
  Oper Status: Up
  Compression: Off
  Fastwrite: Off
  Tape Acceleration: Off
  TPerf Option: Off
  IPSec: Disabled
  QoS Percentages: High 50%, Med 30%, Low 20%
  Remote WWN: Not Configured
  Local WWN: 10:00:00:05:1e:52:fe:00
  Peer WWN: 10:00:00:05:1e:39:a4:76
  Circuit Count: 2
  Flags: 0x00000000
  FICON: Off
  ______
  Circuit ID: 1/12.0
     Circuit Num: 0
     Admin Status: Enabled
     Oper Status: Up
     Connection Type: Default
     Remote IP: 192.168.12.200
     Local IP: 192.168.12.100
     Metric: 0
     Min Comm Rt: 2500000
     Max Comm Rt: 2500000
     SACK: On
     Min Retrans Time: 100
     Max Retransmits: 8
```

```
Keepalive Timeout: 10000
  Path MTU Disc: 0
  VLAN ID: (Not Configured)
  L2CoS: (VLAN Not Configured)
  DSCP: F: 0 H: 0 M: 0 L: 0
  Flags: 0x00000000

To display the inband management interface for all GbE Ports on a Brocade 7800:

switch:admin> portshow mgmtif all

	Management: ge0 En		Effective MTU	Flags
0	20.20.0.151	255.255.255.0	1500	
Inband M	Management: gel E	nabled		
Interfac	ce IPv4 Address	NetMask		_
	20.20.1.151			
Inband M	Ianagement: ge2 E1	nabled		
	e IPv4 Address			_
	20.20.2.151			
Flags: U	J=Up B=Broadcast 1	D=Debug L=Loopbac	ck P=Point2Point	R=Running

N=NoArp PR=Promisc M=Multicast S=StaticArp LU=LinkUp

To display the inband management interface for a single GbE Port on a Brocade 7800:

switch:admin> portshow mgmtif ge0

```
Inband Management: ge0 Enabled
Interface IPv4 Address NetMask
                         Effective MTU Flags
______
     20.20.0.151 255.255.255.0 1500
```

Flags: U=Up B=Broadcast D=Debug L=Loopback P=Point2Point R=Running N=NoArp PR=Promisc M=Multicast S=StaticArp LU=LinkU

To display the IP routes for all management interfaces on a Brocade 7800:

switch:admin> portshow mgmtroute all
Inband Management Routes:

Port: ge0 IP Address	Mask	Gateway		_		
	255.255.255.0		0	U		
Port: gel IP Address	Mask	Gateway	Metric	Flags		
192.168.1.0 20.20.1.0	255.255.255.0 255.255.255.0	20.20.1.250	0	U G U		
Port: ge2 IP Address	Mask	Gateway	Metric	Flags		
20.20.2.0	255.255.255.0	*	0	U		
Flags: U=Usable G=Gateway H=Host C=Created(Interface) S=Static						

To display the route for a single management interface on a Brocade 7800:

switch:admin> portshow mgmtroute ge1

Inband Management Routes:

L=LinkLayer(Arp)

Port: gel IP Address	Mask	Gateway	Metric	Flags
192.168.1.0	255.255.255.0	20.20.1.250	0	U G
20.20.1.0	255.255.255.0	*	0	U

Flags: U=Usable G=Gateway H=Host C=Created(Interface) S=Static
L=LinkLayer(Arp)

To display FCP emulation statistics using the command with two levels and a single command:

```
switch:admin> portshow xtun 1/13 -fcp -itl -itn -stats
```

To display FCP emulation statistics, information, and configuration information using the command with a single level and three commands:

```
switch:admin> portshow xtun 1/13 -fcp -itl -stats \
    -info -cfg
```

To display FICON statistics on the Brocade 7800:

```
switch:admin> portshow xtun 16 -ficon -stats

To display FICON Teradata Read and Write performance data:
```

```
switch:admin> portshow xtun 16 -ficon -teraperf
Tera Performance Monitor Data:
Sample Time Period in ms: 4318
Tera Write Performance Data:
    Emulated Chains per sec: 1186
      Emulated CCWs per sec: 1186
       Ave Write Block Size: 22617
        Emulated Write BPS: 26831514
Tera Read Performance Data:
 _____
    Emulated Chains per sec: 1069
      Emulated CCWs per sec: 1069
       Ave Read Block Size: 10780
         Emulated Read BPS: 11531104
```

To display FICON Printer performance data:

```
switch:admin> portshow xtun 23 -ficon -printperf
Printer Performance Monitor Data:
```

Sample Time Period in ms: 7460 _____ No Emulated Printer operations _____ No Emulated Read operations

To display FICON tape performance data:

```
Tape Performance Monitor Data:
Sample Time Period in ms: 2461
Tape Write Performance Data:
 ______
   Emulated Chains per sec: 480
     Emulated CCWs per sec: 3069
     Ave Write Block Size: 32760
       Emulated Write BPS: 100540440
 ______
No Emulated Read operations
```

switch:admin> portshow xtun 23 -ficon -tapeperf

To display FICON XRC performance data:

```
switch:admin> portshow xtun 23 -ficon -xrcperf
```

```
XRC Performance Monitor Data:
Sample Time Period in ms: 11340
   Emulated Chains per sec: 16
  Emulated RRS Cmds per sec: 16
 Emulated RRS Bytes per sec: 640
    Average RRS Update Size: 40
```

FUNCTION Commands supported only on the Brocade FR4-18i blade

SYNOPSIS portshow option [slot/]ge_port [all | tunnel_id] [arguments]

DESCRIPTION

Use this command to display configuration parameters and status information for FCIP tunnels on the Brocade FR4-18i blade. The following display options are supported:

- portShow fciptunnel Displays Fibre Channel over IP (FCIP) tunnel configuration settings including the following:
 - Additional performance parameters
 - FC data path credit data
 - Connection parameter information
 - IKE and IPSec policy information on IPSec-enabled tunnels
 - VC to FCIP QoS mapping table
 - FCIP TCP Byte Stream statistics on Byte Stream-enabled tunnels
 - History of TCP connections
 - SnapShow capture of TCP statistics between two points in time
- portShow mode Displays Port Mode information.
- portShow ficon Displays FICON parameters on FICON-configured tunnels.

Each GbE port is associated with a TCP history, which tracks the state of statistics at the moment of a TCP connection failure. An entry is logged for the TCP connection when it encounters any of the following failures:

- Maximum number of retransmits is exceeded (MAX RTX)
- Maximum keep alive timeout is exceeded (KEEPALV TO)
- RST packet is received (RESET RCVD)

2

You can display the TCP history with the **fciptunnel -hist** command. This command displays a maximum of 16 entries. Once the maximum history length is reached, the oldest entry is removed from the end, and the newest entry is added to the front of the TCP history as future connection failures occur. The following data items are captured when a TCP connection encounters a failure:

Reason

The reason for the TCP connection failure

RTT

Round trip time

RTT H

Round trip time high water mark

Var

Variance

Var H

Variance high water mark

000

Counter of out-of-order segments

000 H

Out-of-order segments high water mark

Sendw Cwnd

Size of sender congestion window (bytes)

Rx win

Size of receive window (bytes)

Fast Rtx

Fast retransmits

F Rtx H

Fast retransmits high water mark

Slow Rtx

Slow retransmits

InFlt H

Packets in-flight high water mark

SlowStarts

Counter of slow starts

Rtx TO

Retransmit timeouts

Rtx Rtx TO

Counter of retransmit packets due to timeout

Dup ACK

Counter of duplicate ACKs

Rtx Dup ACK

Counter of retransmit packets due to duplicate ACK

LPort

Local port

RPort

Remote port

Along with history, the system keeps track of the following TCIP statistics, which you can display with the **fciptunnel -snapshow** option. The statistic is collected from system startup onwards until it is reset with the **fciptunnel -snapstart** option. Subsequent calls to **-snapshow** display statistics collected since the system was last reset.

The TCIP statistics include the following information:

Tunnel Num

The tunnel number associated with this TCP connection

Connection

The type of TCP connection (CONTROL or DATA)

LPort

Local port

RPort

Remote port

000

Counter of out-of-order segments

000 H

Out-of-order segments high water mark

Dup ACK

Counter of duplicate ACKs

Rtx Dup ACK

Counter of retransmit packets due to duplicate ACK

Fast Rtx

Fast retransmits

F Rtx H

Fast retransmits high water mark

Slow Rtx

Slow retransmits

InFlt H

Packets in-flight high water mark

SlowStarts

Counter of slow starts

Rtx TO

Retransmit timeouts

Rtx Rtx TO

Counter of retransmit packets due to timeout.

NOTES

The Byte Streaming feature is no longer supported as of Fabric OS v7.0.0.

OPERANDS

This command supports the following operands:

slot

For bladed systems only, specify the slot number of the port to be configured,

followed by a slash (/).

[ge]port

Specifies the GbE port number to be displayed relative to its slot for bladed systems. GbE ports on the Brocade 7500/7500E and FX-18i are numbered ge0

and ge1. See switchShow for a listing of valid ports.

2

all | tunnel_id

For FCIP-related command options only, specify **all** to display all FCIP tunnels or a Tunnel ID between 0 and 7 to display a single FCIP tunnel.

fciptunnel

Displays FCIP tunnel IDs, remote and local IP addresses, remote and local WWNs, compression status, FCIP FastWrite status, Tape Pipelining status, bandwidth rate, SACK status, Minimum Retransmit time, Keepalive Timeout, Maximum Retransmissions, DSCP Marking, tunnel status, tunnel uptime. Refer to portCfg help for an explanation of these parameters.

Additional optional arguments for **fciptunnel** include the following:

-perf

Displays additional performance information.

-params

Displays connection parameter information. The display includes the following High Water Marks:

- Packets in flight
- Round trip time
- Round trip time variance
- Fast retransmits
- Out of order packets received

-credits

Displays FC data path credit data.

-ipsec

Displays IKE and IPSec policy information on IPSec-enabled tunnels. Security policies are configured with the **portCfg** command.

-qosmap

Displays the mapping table for VC to FCIP QoS.

-bstr

Displays FCIP TCP Byte Stream statistics on Byte Stream-enabled tunnels (Deprecated).

-hist

Displays the history of TCP connections.

-snapstart

Resets TCP statistics. The collection of the statistics restarts when this command is executed. It ends when the **-snapshow** option is executed.

-snapshow

Displays the TCP statistics that were collected since startup or since the statistics were reset with the **-snapshow** command.

mode

Displays mode of GbE port as either "FCIP" or "not configured".

ficon

Displays FICON emulation configuration parameters.

The syntax for **portshow ficon** is as follows:

portshow ficon [s/ot/] ge_port all | tunnel_ld [arg] [parm] [-clear]

The following arguments are supported with ficon:

-globals

Displays general FICON controls and statistics.

-images

Displays discovered Images (FCUB).

-emul

Displays emulated FDCBs.

-active

Displays active FDCBs.

-epcb

Displays Emulation Control Block (port specific).

-fhpb

Displays FICON Host Path Block.

-fdpb adrs

Displays FICON Device Path Block.

-fchb

Displays FICON Channel Control Block.

-fcub

Displays FICON Control Unit Control Block.

-fdcb adrs

Displays FICON Device Control Block.

-mem adrs

Displays memory in 256-byte increments: ! for next.

-pools

Displays current data buffer pool counts.

-pmmr

Displays PMMR pointers.

-fastw

Displays the FastWrite queue.

-clear

Clears post-display statistics; requires a preceding argument.

EXAMPLES

To display the connection parameter information for all FCIP tunnels on the switch and to show the current DiffServ markings being used for data connection as well as control connection (The following example displays high-water marks in bold for the data and control TCP connections of Tunnel 0):

```
switch:admin> portshow fciptunnel -all -params
Port: ge0
 Tunnel ID 0
 Tunnel Description "Test Description"
 Remote IP Addr 192.168.10.2
 Local IP Addr 192.168.44.9
 Remote WWN Not Configured
 Local WWN 10:00:00:05:1e:38:84:65
 Compssion off
 Fastwrite off
 Tape Pipelining off
 ACK on
 Min Retransmit Time 100
 Keepalive Timeout 10
 Max Retransmissions 8
 VC OoS Mapping off
 DSCP Marking (Control): 0, DSCP Marking (Data): 0
 TCP Byte Streaming on
```

```
Status : Inactive
  Connected Count: 0
Port: gel
_____
Tunnel ID 0
Tunnel Description "Test Description"
Remote IP Addr 192.168.10.10
Local IP Addr 192.168.10.2
Remote WWN Not Configured
Local WWN 10:00:00:05:1e:39:37:5f
Compression off
Fastwrite off
Tape Pipelining off
Committed Rate 900000 Kbps (0.900000 Gbps)
SACK on
Min Retransmit Time 100
Keepalive Timeout 10
Max Retransmissions 8
  VC QoS Mapping off
  DSCP Marking (Control): 0, DSCP Marking (Data): 0
  VLAN Tagging Not Configured
  TCP Byte Streaming on
  Status : Active
  Connected Count: 3
Uptime 23 minutes, 53 seconds
FC control traffic TCP connection:
  Local 192.168.10.2:4149, Remote 192.168.10.10:3225
  Runtime parameters:
    Send MSS 1460 Bytes
    Sender stats:
      smoothed roundtrip 1 ms (HWM 1 ms), variance 1 (HWM 562)
      peer advertised window 13498368 Bytes
      negotiated window scale (shift count) 9
      congestion window 25920 Bytes
      slow start threshold 20480 Bytes
      operational mode: congestion avoidance
      0 packets queued: TCP sequence# NXT(2454152682)
      0 packets in-flight (HWM 4)
      Send.Unacknowledged(TCP sequence# 2454152682) recovery:
        retransmit timeout 500 ms, duplicate ACKs 0
        retransmits 0 (max retransmits 8)
      loss recovery: fast retransmits 0 (HWM 0), \
            retransmit timeouts 1
   Receiver stats:
      advertised window 13498368 Bytes (max 13498368)
      negotiated window scale (shift count) 9
      0 packets queued: TCP sequence# NXT(646865406)
      0 out-of-order packets queued (HWM 0) (0 lifetime total)
   Keepalive:
      time since last activity detected 1 s
      idle connection probe interval 1 s
         timeout 10 s
    Data transfer TCP connection:
         Local 192.168.10.2:4150, Remote 192.168.10.10:3226
      Runtime parameters:
         Send MSS 1460 Bytes
      Sender stats:
        smoothed roundtrip 0 ms (HWM 1 ms), \
            variance 0 (HWM 562)
```

```
peer advertised window 20443136 Bytes
    negotiated window scale (shift count) 9
    congestion window 169464 Bytes
    slow start threshold 112500 Bytes
    operational mode: congestion avoidance
    0 packets queued: TCP sequence# NXT(3715211236)
    0 packets in-flight (HWM 3)
    Send.Unacknowledged(TCP sequence# 3715211236) recovery:
      retransmit timeout 500 ms, duplicate ACKs 0
      retransmits 0 (max retransmits 8)
    loss recovery: fast retransmits 0 (HWM 0),\
      retransmit timeouts 1
Receiver stats:
    advertised window 53997568 Bytes (max 53997568)
    negotiated window scale (shift count) 9
    0 packets queued: TCP sequence# NXT(1502034779)
    0 out-of-order packets queued (HWM 0) (0 lifetime total)
Keepalive:
    time since last activity detected 0 s
    idle connection probe interval 1 s
    timeout 10 s
```

To display the performance information on an FCIP tunnel:

```
switch:admin> portshow fciptunnel 9/ge0 0 -perf
Slot: 9 Port: ge0
Tunnel ID 0
Tunnel Description "Test Description"
Remote IP Addr 10.62.0.100
Local IP Addr 10.10.9.100
Remote WWN Not Configured
Local WWN 10:00:00:05:1e:39:d4:5a
Compression on (Auto)
Fastwrite on
Tape Pipelining on
Uncommitted bandwidth, minimum of 1000 Kbps (0.001000 Gbps)
Min Retransmit Time 100
Keepalive Timeout 90
Max Retransmissions 9
VC QoS Mapping off
DSCP Marking (Control): 10, DSCP Marking (Data): 62
VLAN Tagging Id 1062, L2CoS (Control): 1, L2CoS (data): 0
TCP Byte Streaming on
Status : Active
Connected Count: 1
Uptime 2 hours, 12 minutes, 5 seconds
QoS shaper performance stats:
    48152162 Bytes
        2961 Bps 30s avg, 6075 Bps lifetime avg
    29286242 compressed Bytes
       2065 Bps 30s avg, 3695 Bps lifetime avg
    1.64 compression ratio
FC control traffic TCP connection:
    Local 10.10.9.100:4099, Remote 10.62.0.100:3225
    Performance stats:
        44862 output packets
           2 pkt/s 30s avg, 5 pkt/s lifetime avg
        34118172 output Bytes
```

```
1655 Bps 30s avg, 4305 Bps lifetime avg
        951 packets lost (retransmits)
           12.25% loss rate 30s avg
        38563 input packets
           2 pkt/s 30s avg, 4 pkt/s lifetime avg
        8208640 input Bytes
           699 Bps 30s avg, 1035 Bps lifetime avg
Data transfer TCP connection:
         Local 10.10.9.100:4100, Remote 10.62.0.100:3226
    Performance stats:
        41255 output packets
           5 pkt/s 30s avg, 5 pkt/s lifetime avg
        2149844 output Bytes
           252 Bps 30s avg, 271 Bps lifetime avg
        1 packets lost (retransmits)
           0.00% loss rate 30s avg
        33521 input packets
           4 pkt/s 30s avg, 4 pkt/s lifetime avg
        4006508 input Bytes
           464 Bps 30s avg, 505 Bps lifetime avg

```

To display FICON EPCB for a GbE port 0 tunnel ID 1 with post display clearing of relevant statistics:

```
switch:admin> portshow ficon ge0 1 -epcb -clear
```

To display a list of discovered devices and selected path and status information on each. Get the *adrs* from this display for the next command:

```
switch:admin> portshow ficon ge0 all -fdcb
```

To display details on the FDCB specified in the *adrs* argument, which was derived from the previous example:

```
switch:admin> portshow ficon ge0 all -fdcb 10008000
```

To display the same information as the previous example but with post display clearing of relevant

switch:admin> portshow ficon ge0 all -fdcb 10008000 -clear

portStats64Show

Displays the 64-bit hardware statistics for a port.

SYNOPSIS portstats64show [s/ot/]port [-long]

DESCRIPTION

Use this command to display 64-bit hardware statistics for a specified port. When used without the **-long** option, two integers are reported for most values, the lower and upper 32-bits are reported as two separate numbers. In this case, the top word is the most significant. When issued with the **-long** option, the command displays the counters as one single 64-bit number.

stat64_wtx

Number of 4-byte words transmitted.

stat64_wrx

Number of 4-byte words received.

stat64_ftx

Number of frames transmitted.

stat64_frx

Number of frames received.

stat64_c2_frx

Number of class 2 frames received.

stat64_c3_frx

Number of class 3 frames received.

stat64_lc_rx

Number of link control frames received.

stat64_mc_rx

Number of multicast frames received.

stat64_mc_to

Number of multicast timeouts.

stat64_mc_tx

Number of multicast frames transmitted.

tim64_rdy_pri

Number of times R_RDY was high priority.

tim64_txcrd_z

Number of times that the TX BB_credit was at zero.

er64_enc_in

Number of encoding errors inside of frames.

er64_crc

Number of frames with CRC errors.

er64_trunc

Number of frames shorter than minimum.

er64_toolong

Number of frames longer than maximum.

er_bad_eof

Number of frames with bad end-of-frame.

er64_enc_out

Number of encoding error outside of frames.

er64_disc_c3

Number of class 3 frames discarded.

stat64_rateTxFrame

Tx frame rate (frames/second).

stat64_rateRxFrame

Rx frame rate (frames/second).

stat64_rateTxPeakFrame

Tx peak frame rate (frames/second).

stat64_rateRxPeakFrame

Rx peak frame rate (frames/seconds).

stat64_rateTxWord

Tx Word rate (words/seconds).

stat64_rateRxWord

Rx Word rate (words/seconds).

stat64_rateTxPeakWord

Tx peak Word rate (words/sec).

stat64_rateRxPeakWord

Rx peak Word rate (words/sec).

stat64_PRJTFramees

Number of P_RJT frames transmitted.

stat64_PBSYFrames

Number of P_BSY transmitted.

stat64_inputBuffersFull

Number of occasions on which input buffers are full.

stat64_rxClass1Frames

Number of class 1 frames received.

stat64_aveTxFrameSize

Average Tx Frame size, based on the word and frame counts during the last five seconds.

stat64_aveRxFrameSize

Average Rx Frame size, based on the word and frame counts during the last five seconds.

The following counters provided by SNMP are displayed with **portStats64Show -long** on switches running Fabric OS v6.4.0 or later:

swConnUnitZeroTenancy, zero_tenancy

Number of times a zero tenancy occurred.

swConnUnitFLNumOfTenancy, fl_tenancy

Number of times the FL_Port had a loop tenancy.

swConnUnitNLNumOfTenancy,, nl_tenancy

Number of times any NL_Port had a loop tenancy.

swConnUnitStopTenancyStarvation, Starve_stop

Number of loop tenancies stopped due to starvation.

swConnUnitOpend, opened

Number of times the FL_Port entered OPENED state.

swConnUnitTransferConnection, transfer

Number of times the FL_Port entered TRANSFER state.

swConnUnitOpen, open

Number of times the FL_Port entered OPEN state.

swConnUnitInvalidARB, er_inv_arb

Number of invalid arbitrated loops (ARBs).

The following counters are platform-specific and applicable only to Condor2 and Goldeneye2 ASICs only. Refer to the *Fabric OS Troubleshooting and Diagnostics Guide*, Appendix A, for a table that correlates ASIC type with switch models.

swConnUnitFTB1Miss, er_type1_miss

The number of FCR frames with transmit errors.

swConnUnitFTB2Miss, er_type2_miss

The number of frames with routing errors.

swConnUnitFTB6Miss, er_type6_miss

The number of FCR frames with receive errors.

swConnUnitZoneMiss, er_zone_miss

Number of frames with hard zoning miss

swConnUnitLunZoneMiss, er_lun_zone_miss

Number of frames with logical unit number (LUN) zoning miss.

$swConnUnittStatRxMulticastToObjects, stat_mc_to$

The number of multicast timeouts.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on FCoE ports.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to be displayed,

followed by a slash (/).

port

Specify a port number to be displayed, relative to its slot for bladed systems. Use

switchShow to display a list of valid ports.

-long

Displays the counters as one single 64-bit number. This operand is optional; if omitted, the lower and upper 32-bits are reported as two separate numbers.

EXAMPLES

To display the 64-bit hardware statistics for a port:

switch:user> portstats64show 4/15

```

SEE ALSO portStatsClear, portStatsShow

portStatsClear

Clears port hardware statistics.

SYNOPSIS I

portstatsclear [s/ot/]port

portstatsclear -i [index1[-index2] [...] [-f]]

portstatsclear -slot [slot1[-slot2][...]

portstatsclear -h

DESCRIPTION

Use this command to clear the hardware statistics for the specified ports. Including ALPA-based CRC monitor, End-to-End monitor, and Filter-based performance monitor statistics.

You can identify a single port to be cleared by its port number or by its port index number. Port ranges are supported with index numbers or by specifying a slot or a slot range. Use **switchShow** for a listing of valid ports, slots, and port index numbers.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index argument to display the **portSwap** status, or alternately use **portSwapShow**.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on FCoE ports.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the port to be cleared,

followed by a slash (/).

port

Clears a single port identified by the port number, relative to its slot on bladed systems. Port ranges are not supported with this command. Use **switchShow** for

a listing of valid ports.

-i index1[-index2]

Clears a single port or a range of ports identified by port index numbers. You may specify multiple index ranges separated by a space, for example, -i 33-47 65-73.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot [slot1[-slot2]

Clears all ports on a slot or on a range of slots, for example, **-s** 3-5. You may specify multiple slot ranges separated by a space, for example, **-s** 3-5 8-10.

-h

Displays the command usage.

EXAMPLES

To clear hardware statistics for a single port specified by its port number:

```
switch:admin> portstatsclear 4/15
```

To clear hardware statistics for a single port specified by its index number:

```
switch:admin> portstatsclear -i 25
```

To clear hardware statistics for a range of ports specified by their index numbers:

```
switch:admin> portstatsclear -i 32-40
```

To clear hardware statistics for multiple port ranges specified by their index numbers:

```
switch:admin> portstatsclear -i 32-40 50-56
```

To clear hardware statistics for all ports on slots 3-5:

```
switch:admin> portstatsclear -s 3-5
```

To clear hardware statistics for all ports on slots 3-5 and 7-10:

```
switch:admin> portstatsclear -s 3-5 7-10
```

SEE ALSO portStats64Show, portStatsShow, portSwapDisable, portSwapShow, switchShow

portStatsShow

Displays port hardware statistics.

SYNOPSIS portstatsshow [slot/]port

portstatsshow -i [index1[-index2][...] [-f]]

portstatsshow -slot [slot1[-slot2][...]

portstatsshow ge [slot/]ge port

portstatsshow ip [slot/]ge port [ip_address]

portstatsshow fcip [slot/]ge port [tunnel_number]

portstatsshow -h

DESCRIPTION

Use this command to display port hardware statistics counters. Some counters are platform- or port-specific and display only on those platforms and ports. All statistics have a maximum 32-bit value of 4,294,967,295.

You can display statistics for a single port identified by its port number or by its port index. Port ranges are supported with index numbers and by specifying a slot or a slot range. Use **switchShow** for a listing of valid ports, slots, and port index numbers.

Specifying multiple ports with the index (-i) or slot (-s) option is supported only if **PortSwap** is disabled. They are not supported on GbE ports and configured F_Port trunks. Use the -i option without a port index to display the **portSwap** status, or alternately use **portSwapShow**.

The command output may include the following fields (Tx indicates frames transmitted by the port; Rx indicates frames received by the port).

stat wtx

The number of 4-byte words transmitted.

stat_wrx

The number of 4-byte words received.

stat_ftx

The number of frames transmitted.

 $stat_frx$

The number of frames received.

stat_c2_frx

The number of class 2 frames received.

stat_c3_frx

The number of class 3 frames received.

stat_lc_rx

The number of link control frames received.

stat_mc_rx

The number of multicast frames received.

stat_mc_to

The number of multicast timeouts.

stat_mc_tx

The number of multicast frames transmitted.

tim_rdy_pri

The number of times that sending R_RDY or VC_RDY primitive signals was a higher priority than sending frames, due to diminishing credit reserves in the transmitter at the other end of the fiber. This parameter is sampled at intervals of 1.8 microseconds, and the counter is incremented by 1 if the condition is true.

tim_txcrd_z

The number of times that the port was unable to transmit frames because the transmit BB credit was zero. The purpose of this statistic is to detect congestion or a device affected by latency. This parameter is sampled at intervals of 2.5 microseconds, and the counter is incremented if the condition is true. Each sample represents 2.5 microseconds of time with zero Tx BB Credit. An increment of this counter means that the frames could not be sent to the attached device for 2.5 microseconds, indicating degraded performance.

tim_txcrd_z_vc

The number of times that the port was unable to transmit frames because the transmit BB credit was zero for each of the port's 16 Virtual Channels (VC 0-15). The purpose of this statistic is to detect congestion or a device affected by latency. This parameter is sampled at intervals of 2.5 microseconds (microseconds), and the counter is incremented if the condition is true. Each sample represents 2.5 microseconds of time with zero Tx BB Credit. An increment of this counter means that the frames could not be send to the attached device for 2.5 microseconds, indicating degraded performance (platform- and port-specific).

er_enc_in

The number of encoding errors inside frames.

er_crc

The number of frames with cyclic redundancy check (CRC) errors.

er_trunc

The number of frames shorter than the minimum frame length.

er_toolong

The number of frames longer than the maximum frame length.

er_bad_eof

The number of frames with bad end-of-frame.

er_enc_out

The number of encoding error outside frames.

er_bad_os

The number of invalid ordered sets (platform- and port-specific).

er_rx_c3_timeout

The number of receive class 3 frames received at this port and discarded at the transmission port due to timeout (platform-and port-specific).

er_tx_c3_timeout

The number of transmit class 3 frames discarded at the transmission port due to timeout (platform- and port-specific).

er_c3_dest_unreach

The number of class 3 frames discarded because the transmit port, although it is determined, cannot send the frame at the moment when the error occurs.

er_other_discard

The number of other discarded due to route lookup failures or other reasons.

er_zone_discard

The number of class 3 frames discarded due to zone mismatch.

er_type1_miss

The number of FCR frames with transmit errors.

er_type2_miss

The number of frames with routing errors.

er_type6_miss

The number of FCR frames with receive errors.

er_zone_miss, er_lun_zone_miss

The number of frames discarded due to hard zoning miss or LUN zoning miss. If Rx port hard zoning is enabled, frames will be discarded at the Rx port. If TX port hard zoning is enabled, frames will be discarded at the TX port. If both RX and TX port hard zoning is enabled, frames will be discarded at the RX port. (LUN zoning

is currently not supported.)

er_crc_good_eof

The number of CRC errors with good end-of-frame (EOF) (platform- and

port-specific).

er_inv_arb

The number of invalid arbitrated loops (ARBs).

open

The number of times the FL_Port entered OPEN state.

transfer

The number of times the FL_Port entered TRANSFER state.

opened

The number of times the FL_Port entered OPENED state.

starve_stop

The number of loop tenancies stopped due to starvation.

fl_tenancy

The number of times the FL_Port had a loop tenancy.

nl_tenancy

The number of times the NL_Port had a loop tenancy.

zero_tenancy

The number of times a zero tenancy occurred.

ge_stat_tx_frms

The number of frames transmitted on the GbE port.

ge_stat_tx_octets

The number of octets transmitted on the GbE port.

ge_stat_tx_ucast_frms

The number of unicast frames transmitted on the GbE port.

ge_stat_tx_mcast_frms

The number of multicast frames transmitted on the GbE port.

ge_stat_tx_bcast_frms

The number of broadcast frames transmitted on the GbE port.

ge_stat_tx_vlan_frms

The number of VLAN frames transmitted on the GbE port.

ge_stat_tx_pause_frms

The number of pause frames transmitted on the GbE port.

ge_stat_rx_frms

The number of frames received on the GbE port.

ge_stat_rx_octets

The number of octets received on the GbE port.

ge_stat_rx_ucast_frms

The number of unicast frames received on the GbE port.

ge_stat_rx_mcast_frms

The number of multicast frames received on the GbE port.

ge_stat_rx_bcast_frms

The number of broadcast frames received on the GbE port.

ge_stat_rx_vlan_frms

The number of VLAN frames received on the GbE port.

ge_stat_rx_pause_frms

The number of pause frames received on the GbE port.

ge_err_carrier

The number of times the GbE port lost carrier sense.

ge_err_length

The number of times an invalid length error was observed on the GbE port.

ge_err_crc

The number of CRC Errors received on the GbE port.

ge_err_abort

The number of frames aborted on the GbE port.

ge_err_overrun

The number of overruns observed on the GbE port.

ge_err_fifo_ovf

The number of times an overflow of the first in first out (FIFO) queue was

observed on the GbE port.

ip err hdr cksum

The number of checksum errors observed on the GbE port.

ip_err_tcp_data_chksum

The number of IP TCP data checksum errors observed on the GbE port.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is not supported on FCoE ports.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to be displayed,

followed by a slash (/).

[ge]port

Displays statistics for a single port identified by the port number, relative to its slot on bladed systems. Specify the optional **ge** option to display the GbE port hardware statistics. Port ranges are not supported with this command. Use **switchShow** for a listing of valid ports.

-i index1[-index2]

Displays statistics for a single port or for a range of ports identified by port index numbers. You may specify multiple index ranges separated by a space, for

example, -i 33-47 65-73.

-f

Ignores nonexisting ports. This operand is valid only with the -i option.

-slot [slot1[-slot2]

Displays statistics for all ports on a slot or on a range of slots, for example, -s 3-5. You may specify multiple slot ranges separated by a space, for example, -s 3-5

8-10.

ge

Displays the GbE port statistics.

ip

Displays all GbE port statistics related to IP addresses that are not zero. This operand is not supported on the Brocade 7800 and FX8-24 platforms.

ip_address

Specifies an IP address to display statistics only for the specified IP address. This operand is optional and valid only with the ip option.

fcip

Displays the GbE statistics on all FCIP tunnels. This operand is not supported on the Brocade 7800 and FX8-24 platforms.

tunnel_number

Specifies a tunnel ID to display statistics only for the specified FCIP tunnel. This operand is optional and valid only with the fcip option.

-h

Displays the command usage.

EXAMPLES

To display the basic set of statistics for port 1/13 on a DCX backbone:

switch:admin> port	statss	how 13
stat_wtx	0	4-byte words transmitted
stat_wrx	0	4-byte words received
stat_ftx	0	Frames transmitted
stat_frx	0	Frames received
stat_c2_frx	0	Class 2 frames received
stat_c3_frx	0	Class 3 frames received
stat_lc_rx	0	Link control frames received
stat_mc_rx	0	Multicast frames received
stat_mc_to	0	Multicast timeouts
stat_mc_tx	0	Multicast frames transmitted
tim_rdy_pri	0	Time R_RDY high priority
tim_txcrd_z	0	Time TX Credit Zero (2.5Us ticks)
tim_txcrd_z_vc 0-	3: 0	0 0 0
tim_txcrd_z_vc 4-	7: 0	0 0 0
tim_txcrd_z_vc 8-	11: 0	0 0 0
tim_txcrd_z_vc 12-	15: 0	3 3
er_enc_in	0	Encoding errors inside of frames
er_crc	0	Frames with CRC errors
er_trunc	0	Frames shorter than minimum
er_toolong	0	Frames longer than maximum
er_bad_eof	0	Frames with bad end-of-frame
er_enc_out	0	Encoding error outside of frames
er_bad_os	0	Invalid ordered set
er_rx_c3_timeout	0	Class 3 receive frames discarded
		due to timeout
er_tx_c3_timeout	0	Class 3 transmit frames discarded
		due to timeout
er_c3_dest_unreach	. 0	Class 3 frames discarded due to
		destination unreachable
er_other_discard	0	Other discards

```
0 frames with FTB type 1 miss
er_typel_miss
              0 frames with FTB type 2 miss
er_type2_miss
er_lun_zone_miss 0 frames with LUN zoning miss
er_crc_good_eof 0 Crc error with good eof
            0 Invalid ARB
er_inv_arb
              0 loop_open
open
            0 loop_transfer
transfer
opened
              0 FL_Port opened
             0 tenancies stopped due to starvation
starve_stop
              0 number of times FL has the tenancy
0 number of times NL has the tenancy
0 zero tenancy
fl_tenancy
nl_tenancy
zero_tenancy
```

To display the basic set of statistics using port index numbers:

```
switch:admin> portstatsshow -i 13
switch:admin> portstatsshow -i 13-23
switch:admin> portstatsshow -i 4-6 22-30
```

To display the basic set of statistics using slot numbers:

```
switch:admin> portstatsshow -s 3-5
switch:admin> portstatsshow -s 3-5 10-13
```

To display GbE port statistics for GbE1 on the Brocade 7800:

```
switch:admin> portstatsshow ge 8/ge1
ge_stat_tx_frms 1523916 GE transmitted frames
                     152411630 GE transmitted octets
ge_stat_tx_octets
ge_stat_tx_ucast_frms 1523907 GE transmitted unicast frames
ge_stat_tx_mcast_frms 0 GE transmitted multicast frames
ge_stat_tx_bcast_frms 9 GE transmitted broadcast frames
ge_stat_tx_vlan_frms 0 GE transmitted vlan frames
ge_stat_tx_pause_frms 0 GE transmitted pause frames
ge_stat_rx_frms 1512154 GE received frames ge_stat_rx_octets 149255230 GE received octets
ge_stat_rx_ucast_frms 1512154 GE received unicast frames
ge_stat_rx_mcast_frms 0 GE received multicast frames
ge_stat_rx_bcast_frms 0 GE received broadcast frames
ge_stat_rx_vlan_frms 0 GE received vlan frames
ge_stat_rx_pause_frms 0 GE received pause frames
ge_err_carrier 0 GE lost carrier sense
                    0 GE invalid length
ge_err_length
ge_err_crc
ge_err_abort
                    0 GE CRC Errors
                    0 GE abort frames
ge_err_overrun
ge_err_overrun 0 GE overruns
ge_err_fifo_ovf 0 GE Fifo overflow
```

To display statistics for FCIP tunnel 2, slot 8, and GbE1 on the Brocade FR4-18i.:

To display port statistics for all IP addresses, slot 8, and GbE1 on the Brocade FR4-18i:

```
switch:admin> portstatsshow ip 8/gel
ip_err_crc
        0 IP CRC Errors
```

To display port statistics for IP address 192.168.255.10, slot 8, and GbE1 on the Brocade FR4-18i:

```
switch:admin> portstatsshow ip 8/gel 192.168.255.10
ip_out_pkts 3476 IP transmitted packets
ip_out_ucast_pkts 3476 IP transmitted unicast packets
ip_out_bcast_pkts 0 IP transmitted broadcast packets
ip_out_mcast_pkts 0 IP transmitted multicast packets
ip_in_octets 0 IP received comp bytes
ip_in_octets 0 IP received uncompbytes
ip_in_pkts 0 IP received packets
ip_in_ucast_pkts 0 IP received unicast packets
ip_in_bcast_pkts 0 IP received unicast packets
ip_in_mcast_pkts 0 IP received broadcast packets
ip_in_mcast_pkts 0 IP received multicast packets
ip_err_crc 0 IP CRC Errors
ip_err_hdr_cksum 0 IP Checksum Errors
```

SEE ALSO portErrShow, portShow, portSwapDisable, portSwapShow

portSwap

Swaps the port Address of two ports.

SYNOPSIS

portswap [slot1/]port1 [slot2/]port2

DESCRIPTION

Use this command to swap the 24-bit port address (PID) for a pair of ports. Both ports must be disabled prior to executing this command and the port-swapping feature must be enabled using **portSwapEnable**.

The result of this operation is persistent across reboots and power cycles. Use portSwapShow to display the swapped ports along with their new port address

Port swap information is kept in its own database; it cannot be manipulated by editing the configuration database displayed by **configShow** and **configUpload**. To undo a previous port swap, execute **portSwap** again on the same two ports.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

You cannot swap E_ports that are configured as part of a TI zone. The TI zone information is lost when you swap the E_ports. To work around this issue, reconfigure your TI zones rather than swapping the ports.

OPERANDS

This command has the following operands:

slot1

For bladed systems only, specifies the slot number of the first port whose area

number is to be swapped, followed by a slash (/).

port1

Specifies the number of the first port whose address is to be swapped, relative to

its slot for bladed systems. Use **switchShow** to display a listing of valid ports.

slot2

For bladed systems only, specifies the slot number of the second port whose area

number is to be swapped, followed by a slash (/).

port2

Specifies the number of the second port whose port address is to be swapped,

relative to its slot for bladed systems.

EXAMPLES

To swap area numbers between a pair of ports:

switch:admin> portswap 8/1 8/2
portswap done

switch:admin> portswapshow

PortSwap is enabled

Slot	Slotport	Swport	Address
======	========	=========	========
8	1	193	0x01c200
8	2	194	0x01c100

SEE ALSO

portDisable, portEnable, portShow, portSwapDisable, portSwapEnable, portSwapShow, switchShow

portSwapDisable

Disables the PortSwap feature.

SYNOPSIS portswapdisable

DESCRIPTION Use this command to disable the PortSwap feature. The **portSwap** command cannot be used after this

feature is disabled.

The disabled state of the PortSwap feature is persistent across reboots and power cycles.

Enabling or disabling the PortSwap feature does not affect previously performed PortSwap operations.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To disable the PortSwap feature:

switch:admin> portswapdisable

SEE ALSO portSwap, portDisable, portEnable, portShow, portSwapEnable, portSwapShow, switchShow

portSwapEnable

Enables the PortSwap feature.

SYNOPSIS portswapenable

DESCRIPTION Use this command to enable the PortSwap feature. The **portSwap** command cannot be used unless the

feature is first enabled with this command.

The enabled state of the PortSwap feature is persistent across reboots and power cycles.

Enabling or disabling the PortSwap feature does not affect previously performed PortSwap operations.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To enable the PortSwap feature:

switch:admin> portswapenable

SEE ALSO portSwap, portDisable, portEnable, portShow, portSwapDisable, portSwapShow, switchShow

portSwapShow

Displays the state of the PortSwap feature.

SYNOPSIS portswapshow

DESCRIPTION

Use this command to display the state of the PortSwap feature and information about swapped ports. If portSwap is enabled and ports have been swapped, the command displays the enabled status as well as the swapped ports and the new port address (the 24-bit PID) for these ports. If portSwap is disabled, the command shows the disabled status and indicates whether or not swapped ports exist on the switch.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

None

EXAMPLES

To display a switch with PortSwap enabled and information for swapped ports:

Console message:

```
2009/10/09-21:22:45, [PSWP-1001], 482, SLOT 6 | FID 51, INFO,
DCX_105_51, PID for port 12/0 and port 12/63 are swapped.
New PID for port 12/0 is 0x697000 and port 12/63 is 0x69e3c0.
```

switch:admin> portswapshow

PortSwap is enabled

Slot	Slotport	Swport	Address
=======			=======
12	0	112	0x697000
12	63	895	0x69e3c0

To display the portSwap status on a switch when the feature is disabled and no ports are swapped:

switch:admin> portswapshow PortSwap is disabled. Existing Portswap condition is still effective. Only future Portswap operations are not allowed.

No ports have been swapped

portSwap, portDisable, portEnable, portShow, portSwap, portSwapDisable, portSwapEnable, switchShow

portTest

Performs a functional test of a switch in a live fabric.

SYNOPSIS

porttest

[-ports itemlist]
[-iteration count]
[-userdelay time]
[-timeout time]
[-pattern pattern]
[-patsize size]
[-seed seed]
[-listtype porttype]

DESCRIPTION

Use this command to isolate problems in a single replaceable element and to trace problems to near-end terminal equipment, far-end terminal equipment, or the transmission line. You can perform this test on a daily basis or as needed to verify the persistence of failures detected earlier.

This command verifies the functional operation of the switch by sending frames from a port's transmitter, and looping the frames back through an external fiber cable into the port's receiver. The test exercises all switch components from the main board, to the fibre cable, to the media (of the devices and the switch), and back to the main board.

The cables and media connected should be of the same type: a short-wavelength media (switch) port should be connected to another short-wavelength media (device) port using a short-wavelength cable; a long-wavelength port should be connected to a long-wavelength port, and a copper port should be connected to a copper port.

Only one frame is transmitted and received at any given time. The port LEDs flicker green while the test is running.

This command supports E_Ports, F_Ports (must support ELS Echo), L_Port, and N->N loopback ports. In addition, on switches running Fabric OS v6.4.0 and later, you can now use **portTest** on port configurations that previously caused nonspecific test results or were skipped by **portTest**. The following ports are now support the **portTest** diagnostics.

- Ports with index numbers greater than 255.
- Ports with swapped areas.
- Ports in shared area regions.
- Ports in logical switches.
- Ports in Base Switches.
- Long Distance ports.

This command is currently not supported on the following ports or switch configurations:

- Interchassis links (ICL) ports
- F_Ports connected to an Access Gateway
- EX_Ports
- E_Ports connected to EX_Ports
- The **portTest** diagnostics is not supported in Access Gateway mode.

This command performs the following operations:

- 1. Initiates tests on certain ports (portTest command).
- 2. Stops active tests on certain ports (stopPortTest command).
- 3. Takes a snapshot of the test result (portTestShow command).

Use the **stopPortTest** command to stop the test. Refer to the **stopPortTest** help page for more information.

Use the portTestShow command to view the current status of portTest. Refer to the portTestShow help page for more information.

If there is a port type change during portTest execution, the test continues on a given port as long as it can be supported and it is asked to do so. If a request was made to test all ports on a given switch, portTest starts a new test appropriate for the new port type.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-ports itemlist

Specifies the list of user ports to test. By default, all user ports in the switch are tested. Refer to the itemList help page for more information.

-iteration count

Specifies the number of times (or number of frames per port) to execute this test. Specify 0 to run the test in timeout mode, or specify -1 to run the test indefinitely. The default value is 20.

-userdelay time

Specifies the delay between frames sent by portTest, in milliseconds. The default value is 10 milliseconds.

-timeout time

Specifies the number of seconds to run the test. Setting the iteration to 0 puts the portTest process into timeout mode. The default value is 0.

-pattern pattern

Specifies the pattern of the test packet payload. The pattern is selected from a set of twenty predefined pattern types. Use the dataTypeShow command to view the patterns supported with portTest. For each pattern, the datTypeShow command displays the name, the pattern type number, and an example. Specify the pattern by its type number. If pattern is not specified, it defaults to RANDOM (type=11)

-patsize size

Specifies the size of the pattern. The default pattern size is 1024 bytes. The range is 4 to 2112 bytes.

-seed seed

Specifies the seed value to be used with the pattern. The default seed value is 0xaa.

-listtype porttype

Specifies the type of ports on which to run **portTest**. Valid values for *porttype* include the following:

-1

All ports (default).

-2

All L_Ports.

-3

All F_Ports.

-4

All E_Ports.

-5

All N->N loopback ports.

EXAMPLES To run a functional test on an active switch:

switch:admin> porttest -ports 1/1-1/3

SEE ALSO portLoopbackTest, portTestShow, spinFab, stopPortTest

portTestShow

Displays information from portTest.

SYNOPSIS porttestshow [-ports itemlist]

DESCRIPTION

Use this command to display a snapshot of information from **portTest**. The command output displays statistical data about past test runs and values for parameters that were set when the test was run. Refer to the **portTest** help page for more information on the displayed parameters. The output includes the following information:

Port number

Displays test status for the port. Values are PASS or FAIL.

PortType

Type of port tested.

PortState

Current State of portTest. Values are NO TEST, TESTING, or TEST DONE.

PortTypeToTest

Groups of ports tested. Values are ALL_PORTS, ALL_E_PORTS, ALL_L_PORTS, ALL_L_PORTS, ALL_LB_PORTS, or SINGLE_PORT.

Pattern

The pattern of the test packets payload.

Seed

The seed value used with the selected pattern. The default seed value is 0xaa.

UserDelay

The delay between frames sent by portTest in milliseconds. The default value is

10 milliseconds (ms).

TotalIteration

Total number of test iterations.

CurrentIteration

Current test iteration.

TotalFail

Total number of failed tests.

ConsecutiveFail

Number of consecutive failed tests.

StartTime

portTest start time.

StopTime

portTest end time.

Timeout

Number of timed out tests.

ErrorCode

Error code, if any.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

-ports itemlist

Displays test results for the specified ports. This operand is optional; if omitted, data for all ports are displayed. Refer to the **itemList** help page for further details.

EXAMPLES

To display information from **portTest**:

switch:admin> porttestshow 1
Port 1 : PASS

PortType: OTHER PortState: NO TEST
PortInternalState: INIT PortTypeToTest: NO_TEST
Pattern: 0x0 Seed: 0x0 UserDelay: 0

TotalIteration: 0 CurrentIteration: 0
TotalFail: 0 ConsecutiveFail: 0

StartTime: NONE StopTime: NONE

Timeout: 0 ErrorCode: 0

portThConfig

Configures Fabric Watch event thresholds per port type.

SYNOPSIS

```
portthconfig --set port type -area area
   [-timebase time base]
   [-highthreshold -value value -trigger above | below
   -action actions]
   [-lowthreshold -value value -trigger above | below
   -action actions
   [-buffer value][-nosave]
portthconfig --apply port_type -area area
   [-thresh_level def | cust] [-action_level def| cust]
portthconfig --cancel port_type -area area
   [-thresh level def | cust] [-action level def | cust]
portthconfig --show [port_type] [-area area]
   [[-current | [[-thresh_level cust | def]
   [-action_level cust | def]]
portthconfig --pause | --continue port type
   -area area[,area,...] | all
   -port port list | all
portthconfig --help
```

DESCRIPTION

Use this command to configure thresholds for Fabric Watch event monitoring for all ports of a specified type and to display the configuration and current port status in real time. In addition to the areas traditionally monitored by Fabric Watch, this command supports monitoring Class 3 discard frames on all ports of a specified type. If frame discard errors or any other configured areas exceed the currently effective threshold settings, the Fabric Watch daemon can take one or more of the following actions:

- Send an SNMP message.
- Log a RASlog message.
- Send an E-mail alert.
- Locks the port log.
- Fence the port if port fencing is enabled (not applicable to E_Ports). Refer to portFencing help for more information.

Class 3 frames may be discarded on a port because of timeout, destination unreachable, or other reasons. This command only monitors Class 3 frames that are discarded because of timeout, and is applicable only to Brocade 8 G platforms.

The portThConfig follows a transaction model. When you configure thresholds and actions with the --set option, the changes are saved persistently to nonvolatile storage, but the changes do not become effective until you execute portThConfig --apply. The --apply option allows you to toggle between default settings and your own saved custom configuration and to apply actions and thresholds separately. You may choose to use default thresholds together with a customized subset of available actions, or you may modify some of the thresholds and use the default actions. Use the -nosave option to save the configuration nonpersistently, and use --cancel to remove a nonpersistent configuration.

This command configures thresholds per port_type and the configuration is applied to all ports of the specified type. Configurable ports include E_Ports, optical F_Ports, copper F_Ports, physical ports, and Virtual E_Ports (VE_Ports).

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command requires a Fabric Watch license.

For more information on port threshold configuration procedures, including default values for specific area high/low thresholds, refer to the *Fabric Watch Administrator's Guide*.

OPERANDS

This command has the following operands:

port_type

Specifies the port type for which to configure or display Fabric Watch settings. This operand is optional with the **--show** option. With all configuration options it is required. Valid port types include one of the following:

e-port

Configures or displays all E_Ports (not supported in Access Gateway mode).

fop-port

Configures or displays all optical F_Ports.

fcu-port

Configures or displays all copper F_Ports. This operand is supported only on

embedded platforms and only on copper ports.

port

Configures or displays all physical ports.

ve-port

Configures or displays all VE_Ports. Only a subset of areas can be configured for this port type. When setting VE_Port thresholds for the packet loss area (PKTLOSS), the threshold value accepts up to two decimal points, for example, **-value 0.60**. The VE_Port type is not supported in Access Gateway mode.

-area area

Specifies the area monitored by the Fabric Watch daemon. This operand is optional with the **--show** option. With all configuration options it is required.

The following areas are valid when configuring or displaying configuration settings on E_Ports, optical F_Ports, copper F_Ports, and physical ports. Area values are

not case-sensitive.

CRC

Cyclic redundancy check error

ITW

Invalid transmission word

C3TX_TO

Class 3 transmit frames discarded due to timeout.

LOS

Loss of synchronization

LF

Link failure

RX

Receive error

ΤX

Transmit error

PΕ

Protocol error

LR

Link reset

TU

Trunk Utilization

Only the following areas are valid for VE_Ports.

UTIL

Port utilization

PKTLOSS

Packet loss

ST

State change

--set

Configures the Fabric Watch thresholds for monitoring a specified area for all ports of a specified port type. When configuring a threshold, you must specify a port type and area. The following operands are optional and valid only with the **--set** option. Defaults are used unless you configure custom settings. Defaults parameters vary depending on the area and platform. Refer to the *Fabric Watch Administrator's Guide* for specific details.

-timebase time_base

Specifies the time interval between two samples to be compared. Valid intervals include the following:

day

Samples are compared once a day.

hour

Samples are compared once every hour.

minute

Samples are compared once every minute.

-highthreshold -value value

Specifies the high threshold value for triggering a specified alert action. To change the default value, provide an integer *value*.

-lowthreshold -value value

Specifies the low threshold for triggering a specified alert action. To change the default value, provide an integer value.

-trigger above | below

Specifies the actions for in range port behavior. In range is defined as the space above the low threshold and below the high threshold.

-action actions

Specifies the actions triggered by a configured event condition. Valid values include one or more of the following actions. If more than one action is specified, the actions must be separated by commas.

raslog

Event triggers a RASlog message.

snmp

Event triggers an SNMP trap.

email

Event triggers an e-mail.

portlog

Locks the port log. Following an event, the port log locks to retain information about an event, preventing the information from being overwritten as the log becomes full.

none

Event triggers no action.

-buffer value

Specifies the buffer value for in range behavior. A buffer defines a zone within which event criteria are met, rather than a single threshold value. This operand is valid only with the **-trigger** options.

-nosave

Prevents the configuration changes from being saved persistently. This option allows you to make and view changes without overwriting the saved configuration. When you use **--set** with the **-nosave** option and the switch reboots your changes will be lost.

--apply

Applies the custom or default configuration for thresholds, actions, or both. This command allows you to toggle between custom and default settings. The specified configuration takes effect upon execution of this command. When you select custom, the saved configuration becomes effective. You must specify a port type and area when applying a configuration.

--cancel

Cancels a nonpersistent custom configuration. This command effectively undoes the **-nosave** operation without reboot. You must specify a port type and area type with this command. Thresholds and alarm levels are optional with this command; if omitted, all nonpersistent configurations for the specified port type and area type are canceled.

--show

Displays the threshold configuration or run-time status for all configured port types and areas. You can optionally specify a port type to display the threshold for ports of that type only. The display includes the port persistence time value in seconds, which is set by the **fwSet** command. Specify an area to display the area-specific configuration only. When issued without operands, this command displays Fabric Watch thresholds for all classes and areas.

-current

Displays current values for a specified port type and area, as registered by Fabric Watch, or for all port types and areas. The output includes PortType, Area, Port number, Circuit ID (for the Brocade 7800 and FS8-24 only), Value, State, and Monitoring State (pause or continue). The State field reports whether the current value is above, in range, or below (info) the configured threshold.

The following operands are optional with the **--apply**, **--cancel**, and **--show** options; if omitted, the default thresholds are used.

-thresh_level def | cust

Configures or displays default or custom threshold configuration settings.

-action_level def | cust

Configures or displays default or custom configuration settings.

--pause | --continue arguments

Pauses or resumes monitoring. The following arguments are required:

class

Specifies the class.

-area area[,area]... | all

Specifies the area. You can either specify one or more areas separated by a comma, or you can specify all to indicate all areas.

-port port_list | all

Specifies one or more ports or all ports. The *port_list* operand supports one of the following values:

- A single port number preceded by the slot number on bladed systems.
- A set of comma-separated port numbers, preceded by the slot number on bladed systems, for example, 3,8,15, or 1/1,1/9,2/27.
- A port range, for example 3-24 or 1/1-1/9. A port range cannot span slots.

--help

Displays the command usage.

EXAMPLES

To set custom thresholds for the port class and CRC area with E-mail alerts:

```
switch:admin> portthconfig --set port -area crc \
     -highthreshold -value 2 \
     -trigger above -action email
switch:admin> portthconfig --set port -area crc \
     -highthreshold -value 2 \setminus
     -trigger below -action email
switch:admin> portthconfig --set port -area crc \
     -lowthreshold -value 1 \
     -trigger above -action email
switch:admin> portthconfig --set port -area crc \
     -lowthreshold -value 1 \
     -trigger below -action email
```

To apply the new custom settings so they become effective:

```
switch:admin> portthconfig --apply port -area crc \
     -action cust -thresh_level cust
```

To set custom thresholds for the VE Port class and UTIL area with SNMP alerts and save the thresholds nonpersistently:

```
switch:admin> portthconfig --set ve-port -area util \
     -highthreshold -value 2 \
     -trigger above -action snmp -nosave
switch:admin> portthconfig --set ve-port -area util \
     -highthreshold -value 2 \
     -trigger below -action snmp -nosave
switch:admin> portthconfig --set ve-port -area util \
     -lowthreshold -value 1 \
     -trigger above -action snmp -nosave
switch:admin> portthconfig --set ve-port -area util \
     -lowthreshold -value 1 \
     -trigger below -action snmp -nosave
```

To cancel the custom settings that have previously been saved nonpersistently:

```
switch:admin> portthconfig --cancel ve-port -area \
    util -action_level cust -thresh_level cust
```

To display the port threshold configuration for all port types and areas:

```
switch:admin> portthconfig --show

PortType | Area | PortNo | Value | State | Monitoring
------|-----|-----|-----|
FOP-port | CRC | 000019 | 0 | Info | Continue
```

SEE ALSO fwHelp, portFencing, sysMonitor, thConfig

portTrunkArea

Assigns or removes a trunk area (TA) from a port or port trunk group; displays masterless F_Port trunking configuration.

SYNOPSIS

porttrunkarea --enable [slot/]port1[-port2] -index port_index

porttrunkarea --disable [s/ot/]port1[-port2]

porttrunkarea --disable all

porttrunkarea --show disabled | enabled | trunk | all

porttrunkarea --show slot/port1[-port2]

DESCRIPTION

Use this command to assign a static trunk area (TA) on a port or port trunk group, to remove a TA from a port or group of ports in a trunk, and to display masterless F_Port trunking information. The TA is identified by the port index number displayed in the output of the **switchShow** command.

Masterless F_Port trunking interoperates between the Access Gateway (AG) and Condor-based platforms. It is designed to (1) prevent reassignments of virtual addresses when F_Ports come back online after going offline and (2) to increase N_Port bandwidth.

Assigning a TA to a port or trunk group enables F_Port masterless trunking on that port or trunk group. When a TA is assigned to a port or trunk group, the ports immediately acquires the TA as the area of their process IDs (PID). Likewise, when a TA is removed from a port or trunk group, the ports reverts to the default area as their PID.

Use the **--show** option to obtain configuration details including the following information.

Slot

On enterprise-class platforms, displays the slot number.

Port

Displays the port number.

Type

Displays online masterless trunked F_Port or EX_Port if applicable. Otherwise

displays --.

State

Displays Trunk Master, Slave, or --.

Master

Displays the master port of the trunk group.

TΑ

On standalone switches, displays the user assigned TA number.

DA

On standalone switches, displays the default port area. The default area can be a

port swapped area.

ΤI

On enterprise-class platforms, displays the user-assigned TA port index.

DI

On enterprise-class platforms, displays the default port index. The default port

index can be a port swapped area.

The **--show trunk** option displays the following information:

Trunk Index

Displays the trunk index.

ptA->ptB

ptA indicates the local user port; ptB indicates the remote user port.

sp

Port speed in Gbps.

Bandwidth

The bandwidth (Rx, Tx, and the combined total for Tx+Rx) of the trunk group. Values are displayed as either bits per second (Bps), kilobits per second (Kbps), megabits per second (Mbps), or gigabits per second (Gbps), rounded down to the next integer.

Throughput

Displays the throughput (Rx, Tx, and the combined total for Tx+Rx) of the trunk group. Results are displayed for the previous second. Values are displayed as either bits per second (Bps), kilobits per second (kbps), megabits per second (Mbps), or gigabits per second (Gbps), rounded down to the next integer.

%

Displays the percentage of link utilization (Rx, Tx, and the combined total for Tx+Rx). Even when the link utilization is 100%, the throughput value will be lesser than the bandwidth value, due to the 8b/10b encoding and the control words transmitted. For example, the throughput for an 8 Gbps link at 100% utilization would be approximately 6.8 Gbps.

deskew

The time difference for traffic to travel over each F_Port trunk as compared to the F_Port trunk with the shortest travel time in the group. The value is expressed in nanoseconds divided by 10. The firmware automatically sets the minimum deskew value of the shortest F_Port trunk travel time to 15.

Master

Identifies the master port of the trunk group.

Execution of this command is subject to the following restrictions:

- Only F_Port trunk ports are allowed to be part of a TA. E/F/L/EX_Port will be persistently disabled.
 Private L_Ports remain online but will not run traffic.
- Only one trunk master per TA is permitted. The second trunk master is persistently disabled.
- The entire TA trunk group shares the same port WWN.
- The port must be disabled before a TA can be assigned to a port or removed from a trunk group.
- There is one port whose Default Area is the same as its Trunk Area. You cannot remove that port from the trunk group unless The TA is removed from all ports in the trunk group.
- You must enable trunking on all ports to be included in a TA before you can create a TA. Use **portCfgTrunkPort** or **switchCfgTrunk** to enable Trunking on a port or on all ports of a switch.
- N_Port ID Virtualization (NPIV) support is provided for up to 255 devices per TA. Note that this
 decreases the number of devices available per port, because all participating ports share the same
 area
- F_Port trunking is only supported in CORE PID formats.
- Certain port configuration features are not supported within a TA and the command fails if one of these features is enabled on a port within the trunk group. These features include FastWrite, Port Swapping, Port Mirroring, Long Distance, Interchassis links (ICL), and FICON.
- Ports from different Admin Domains are not allowed to join the same Trunk Area group.

- Ports included in a TA share the same port index. The original port index may be removed in the
 process. This means that D, I zones referring to these indices are no longer part of the switch. For
 details and workarounds, refer to the Fabric OS Administrator's Guide.
- Device Connection Control (DCC) Policy must be removed from ports prior to creating a TA. You can re-enable DCC policy after creating the TA.
- You cannot assign a TA while AG mode is enabled.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Masterless F_Port trunking requires an ISL Trunking license.

OPERANDS

This command supports the following operands:

slot

On enterprise-class platforms, specifies the slot number, followed by a slash (/).

port1[-port2]

Specifies a single port or a port range, relative to its slot on bladed systems. For example, 9/8-15 on an enterprise-class platform indicates slot 9, ports 8 to 15. Port ranges should fall in the octet (8 port) trunk range starting from port 0 on a switch or blade.

--enable

Creates a TA assigned to the specified ports. Use this option with one of the following operands:

-area area_number

On single processor switches, specifies the port area number for the static TA to be created. The TA must fall within the 8 port trunk group starting from port 0 on a switch or blade. The TA must be a default area of an existing port in a given port group. However, you may add ports to the trunk group even when a trunk group has already been assigned by using the same area of the octet trunk group. Use **switchShow** for a list of valid port area or index numbers.

-index port_index

On enterprise-class platforms, specifies the port index for the static TA to be created. The port index must fall within the 8 port trunk group starting from port 0 on a switch or blade. The TA must be a default index of an existing port in a given port group. However, you may add ports to the trunk group even when a trunk group has already been assigned by using the same index of the octet trunk group. Use **switchShow** for a list of valid port indexes.

--disable

Removes specified ports from a TA. If a port with the same default area as the TA assigned for the trunk group is removed, all ports in the trunk group must be explicitly specified for removal.

all

Optionally removes all TA assigned ports on the switch. This option disables masterless F_Port trunking on all ports. All TA assigned ports must be disabled for this option to succeed.

--show

Displays masterless F_Port trunking information. When using this option, specify one of the following operands:

[slot/]/port1[-port2]

Displays configuration for a specified port or port range.

trunk

Displays configuration details for the port trunk group, including user port,

neighboring user port, and master port properties.

enabled

Displays configuration details for all ports included in a user assigned TA (all ports

on which masterless F_Port trunking is enabled).

disabled

Displays configuration details for all ports not included in a user assigned TA (all

ports on which masterless F_Port trunking is not enabled).

all

Displays configuration details for all ports on a switch.

EXAMPLES

To enable masterless F_Port trunking on a standalone switch:

- Disable ports 10-11 by executing portdisable port for each port to be included in the TA.
- Enable Trunk Area for ports 10-11 with area number 37:

```
switch:admin> porttrunkarea --enable 10-11 -index 11
2009/05/15-12:43:10, [SWCH-1012], 60, FID 128, INFO,
sw0, Trunk Area (11) has been enabled for one or more ports
Trunk area 11 enabled for ports 10 and 11.
```

- 3. Re-enable ports 10-11 by executing **portenable** port for each port in the TA.
- 4. Show switch/port information:

```
switch:admin> switchshow
[...]
Index Port Address Media Speed State
_____
[...]
11 10 030b00 id N4 No_Light
11 11 030b00 id N4 No_Light
                                   FC
```

5. Display TA-enabled port configuration:

switch:admin> porttrunkarea --show enabled

Port	Type	State	Master	TA	DA
10				11	10
11				11	11

To disable masterless F Port trunking on ports 10-11:

```
switch:admin> porttrunkarea --disable 10-11
ERROR: port 11 has to be disabled
```

Disable each port prior to removing ports from the TA. Then reissue the command:

```
switch:admin> porttrunkarea --disable 10-11
Trunk area 11 disabled for ports 10 and 11.
```

To display trunk details for a user assigned TA 25 that includes ports 24-25:

To configure a TA on an enterprise-class platform including ports 13 and 14 on slot 10 with port index of 125:

- 1. Disable the ports to be included in the TA.
- 2. Enable TA for ports 13 and 14 on slot 10 with port index of 125:

```
switch:admin> porttrunkarea --enable 10/13-14 -index 125 Trunk index 125 enabled for ports 10/13 and 10/14.
```

3. Show the TA port configuration (ports still disabled):

<pre>switch:admin> porttrunkareashow enabled</pre>							
Slot	Port	Type	State	Master	TI	DI	
10	13				125	125	
10	14				125	126	

4. Enable ports 13 and 14:

```
switch:admin> portenable 10/13
switch:admin> portenable 10/14
```

5. Show the TA port configuration after enabling the ports:

```
      switch: admin> porttrunkarea --show enabled

      Slot
      Port
      Type
      State
      Master
      TI
      DI

      10
      13
      F-port
      Master
      10/13
      125
      125

      10
      14
      F-port
      Slave
      10/13
      125
      126
```

SEE ALSO portCfgTrunkPort, portCfgShow, portShow, switchCfgTrunk, switchShow

portZoneShow

Displays the enforced zone type of the F_Ports and FL_Ports of a switch.

SYNOPSIS portzoneshow

DESCRIPTION Use this command to display the enforced zone type of the F_Ports and FL_Ports of a switch.

Output shows virtual port number (decimal), physical port number (decimal), online status, and if online, port type. If the current zone configuration has been disabled by cfgDisable, the fabric is in non-zoning mode, in which all devices see each other. When default zoning is enabled with "No Access" mode, "No Effective configuration: (No Access)" is displayed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display the zone membership information of ports:

```
switch:user> portzoneshow
[OUTPUT TRUNCATED]

powerOffListSet

Sets the order in which slots are powered off.

SYNOPSIS

powerofflistset

DESCRIPTION

Use this command to Modify the order in which slots are powered off. This command displays the current order, and then prompts you interactively to confirm or modify the power-off position for each slot.

Whenever a power supply goes out of service or a field-replaceable unit (FRU) RU is inserted, the system's available power is compared to the system's required power to determine if there is enough power to operate. If less than the required power is available, the power-off list is processed, until there is sufficient power for the system to operate.

If the system's power supply drops abruptly to insufficient levels, the power-off list cannot be processed. The sudden lack of power causes the CP board processors to cease executing the firmware.

For example, if only one power supply is available to power a fully loaded system and the power supply is removed from the chassis, all system operations terminate immediately, and the power-off list cannot be processed. However, if the system is running on two power supplies (this is not recommended) and one goes into a predicted fail state (in which the power supply is still supplying power), the power-off list is processed as described.

The power-off list does not affect the order, in which slots are powered on. On power-on or when an additional power supply is added, slots are processed sequentially, starting at slot 1.

NOTES

CP blade slots are not included in the power-off list.

Command output may vary depending on the hardware platform.

.Some FRUs may use significant power, but cannot be powered off by the software. For example a missing blower FRU may change the power computation enough to affect how many slot blades can be powered up.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

SEE ALSO chassisShow, powerOffListShow, psShow, slotPowerOff, slotPowerOn, slotShow

powerOffListShow

Displays the order in which slots are powered off.

SYNOPSIS powerofflistshow

DESCRIPTION

Use this command to display the order in which the physical slots are powered off.

Whenever a power supply goes out of service or a field-replaceable unit (FRU) is inserted, the system's available power is compared to the system's required power to determine if there is enough power to operate. If less than the required power is available, the power-off list is processed, until there is sufficient power for the system to operate.

If the system's power supply drops abruptly to insufficient levels, the power-off list cannot be processed. The sudden lack of power causes the CP board processors to cease executing the firmware.

For example, if only one power supply is available to power a fully loaded system and the power supply is removed from the chassis, all system operations terminate immediately, and the power-off list cannot be processed. However, if the system is running on two power supplies (this is not recommended) and one goes into a predicted fail state (in which the power supply is still supplying power), the power-off list is processed as described.

NOTES

Command output may vary depending on the hardware platform.

Control processor (CP) blades are not included in the power-off list.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

None

EXAMPLES

To display the slot power off list order:

switch:admin> powerofflistshow

```
Slot 10 will be powered off 1st Slot 9 will be powered off 2nd Slot 8 will be powered off 3rd Slot 7 will be powered off 4th Slot 6 will be powered off 5th Slot 5 will be powered off 6th Slot 4 will be powered off 7th Slot 3 will be powered off 8th Slot 2 will be powered off 9th Slot 1 will be powered off 10th
```

SEE ALSO

chassisShow, powerOffListSet, psShow, slotPowerOff, slotPowerOn, slotShow

psShow

Displays power supply status.

SYNOPSIS

psshow

DESCRIPTION

Use this command to display the current status of the switch power supplies.

The status of each supply is displayed as:

OK

Power supply functioning correctly.

absent

Power supply not present.

unknown

Unknown power supply unit installed.

predicting failure

Power supply is present but predicting failure.

faulty

Power supply present but faulty (no power cable, power switch turned off, fuse

blown, or other internal error).

For certain switch models, the OEM serial ID data displays after each power supply status line.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To view the status of the power supplies:

```
switch:admin> psshow
```

```
Power Supply #1 is OK
DELTA DPS-1001AB-1E 23000000601 S1
                                      IXD0111000088
Power Supply #2 is faulty
DELTA DPS-1001AB-1E 23000000601 S1
                                      IXD0111000162
Power Supply #3 is OK
DELTA DPS-1001AB-1E 23000000601 S1
                                      IXD0111000120
Power Supply #4 is absent
```

SEE ALSO chassisShow, fanShow

reBoot

Reboots the control processor (CP).

SYNOPSIS

reboot [-f]

DESCRIPTION

Use this command to perform a "cold reboot" (power off/restart) of the control processor. This operation may be disruptive, and the command prompts for confirmation before executing. When you reboot a switch connected to a fabric, all traffic to and from that switch stops. All Fibre Channel ports on that switch including E_Ports become inactive until the switch comes back online.

The behavior of this command depends on the platform:

- When issued on a standalone (single-processor) switch, this command performs a cold reboot of the switch.
- When issued on an enterprise-class platform (Brocade DCX, DCX-4S, or 48000) with two CPs (active and standby), the following rules apply:
 - When the Standby CP reboots, it goes down and there is no failover because there is no traffic
 on that switch. When the Standby CP comes up again, it is temporarily no longer in sync with
 the Active CP.
 - When the Active CP reboots, it fails over to the Standby CP. The Standby CP becomes the new Active CP and traffic is disrupted.
 - When HA is in sync, and reboot -f is issued on the Active CP of a director, the Standby CP takes over as the active CP without traffic disruption. If HA is not in sync, and reboot -f is issued on the Active CP, the Standby CP takes over as the Active CP and traffic is disrupted.
 - When HA is disabled and reboot or reboot -f is issued on the Active CP, both the Active and Standby CPs reboot with the original mastership retained. The original Active CP remains the Active CP after the reboot, and the original Standby CP remains the Standby CP. After the reboot, HA is enabled.
 - When HA is disabled and reboot or reboot -f is issued on the Standby CP, the Standby CP reboots without prompting. It boots up with the default switch only, even if the Active CP has multiple logical switches configured. After the Standby CP boots up, HA is still disabled.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS -f

Causes the CP to fail over to the Standby CP without affecting any of the Fibre Channel Ports. Note that the recommended way to force a failover without affecting any Fibre Channel ports is to issue the **haFailover** command.

EXAMPLES To reboot a standalone switch with a single CP:

```
switch:admin> reboot
Warning: This command would cause the switch to reboot
and result in traffic disruption.
Are you sure you want to reboot the switch [y/n]? y
Broadcast message from root (pts/0) Sun Feb 28 19:49:45 2010...
The system is going down for reboot NOW !!
```

To reboot a CP on a DCX when HA is enabled:

```
switch:admin> reboot
Warning: This command is being run on a control processor (CP)
based system and will cause the active CP to reboot.
Are you sure you want to reboot the active CP [y/n]? y
Broadcast message from root (pts/0) Sun Feb 28 19:49:45 2010...
The system is going down for reboot NOW !!
```

To reboot a CP on a DCX when haFailover is disabled:

```
switch:admin> reboot
```

This command is being run on a control processor (CP) based system. Because HA is disabled, it will cause both active CP and the standby CP to reboot. After reboot, the HA will be enabled.

```
Do you want to continue [y/n] y
Broadcast message from root (pts/0) Sun Feb 28 19:49:45 2010...
The system is going down for reboot NOW !!
```

SEE ALSO fastBoot, haDisable, haEnable, haFailover

roleConfig

Manages user-defined roles.

SYNOPSIS

```
roleconfig --add role_name [-desc description]
[-class rbac class list] [-perm permission]
```

roleconfig --change role_name [-class rbac_class_list
-perm permission [-desc description

roleconfig --delete role_name [-force]

roleconfig --copy new_role -role source_role

roleconfig --show role_name | -all [default]

roleconfig --help

DESCRIPTION

Use this command to create or modify user-defined roles, to define permissions for these roles based on role-based access control (RBAC) permissions and meta-object format (MOF) classes, and to display the configured roles. Two types of access control restriction exist in Fabric OS:

- Restriction by MOF class: A MOF class groups similar Fabric OS commands into feature sets that share the same access permissions. By assigning one or more MOF classes to a role, the account with the specified role can access all the commands included in these classes. For example, the predefined role ZoneAdmin can access the commands under the MOF class Zoning, but not those under the UserManagement class. With the roleConfig command you could define a special admin role called myzonesec and assign access to this role for both the zoning and the userManagement class.
- Restriction by RBAC access level: You can further restrict access by setting RBAC one of the following access levels for the role. The RBAC permissions are set per class.
 - O = observe
 - OM = observe-modify
 - N = none/not available

Use the **--show** option to display information about user-defined roles and default roles. Use the **classConfig** command to display information about MOF classes and associated commands. Note that you cannot modify the predefined Fabric OS roles.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--add

Creates a role with the specified name and optional attributes. The new role is created with two default RBAC classes, "localuserenvironment" and "nocheck" and has the default permissions observe and modify ("OM). A configuration download will always reset the permissions of these two default classes to "OM."

--change

Modifies an existing user-defined role.

role_name

Specifies the name for the role to be created or modified. The name must be unique; it is case-insensitive and can contain only alpha characters. The role name must be at least 4 characters long and cannot exceed 16 characters. The maximum number of user-defined roles allowed on a chassis is 256. This operand is required.

The following operands are optional with --add and --change:

-desc description

Specifies a description for the role of up to 63 characters. Colons (:) are not permitted.

-class class list

Specifies one or more MOF classes to which the role should have access. Classes must be separated by commas. The requested class permissions cannot be higher than those of the Fabric OS Admin role.

-perm permissions

Specifies the RBAC permissions for the role. The RBAC permissions restrict what the user can do with the commands included in the classes to which the role has access. Valid RBAC permissions include the following:

OM

Observe and modify.

0

Observe only.

Ν

No access. This parameter is not valid with the --add option.

--delete role_name [-force]

Deletes the specified user-defined role. This command prompts for confirmation unless you use the -force option. The role must exist in the database and the role cannot currently be assigned to a user account. You cannot delete any of the predefined Fabric OS roles.

--сору

Clones an existing user-defined role by copying an existing role to a new role name. The new role inherits all the classes and permissions of the source role. You can further modify the newly created role. The following operands are required:

new_role

The name for the new role must be unique; it is case-insensitive and can contain only alpha characters. The role name must be at least 4 characters long and cannot exceed 16 characters.

-role source_role

Specified the name of the exiting role to be copied.

--show

Displays information about the specified roles. For each role, the command displays the role name, description, assigned classes and RBAC permissions for each class. The following displays options are exclusive:

role_name

Displays information about the specified user-defined role.

-all [default]

Displays a listing of all user-defined roles. When used together with the optional **-default** option, both the user-defined roles and the predefined Fabric OS roles are displayed.

--help

Displays the command usage.

EXAMPLES

To create a role with Zoning and SecurityAdmnin permissions and OM access:

```
switch:admin> roleconfig --add myzonesec \
    -d "Zone and Security Admin" -c Security,zoning -p OM
```

To change the access permissions of the previously created role and to display the results:

```
switch:admin> roleconfig --change myzonesec -c pki -p N

switch:admin> roleconfig --change myzonesec -c security -p O

switch:admin> roleconfig --change myzonesec -c zoning -p OM

switch:admin> roleconfig --show myzonesec
Role Name : myzonesec
Description : Zone and Security Admin

RBAC Class Permission

Security O
Zoning OM
```

Role permissions changed successfully.

To copy the role myszonesec:

```
switch:admin> roleconfig --copy superrole -r myzonesec
Role 'superrole' is copied successfully.
```

To delete a role:

```
switch:admin> roleconfig --delete -r myzonesec
You are going to delete a user defined role.
Are you sure? (yes, y , no, n) [no] y
Role 'myzonesec' is deleted successfully.
```

SEE ALSO classConfig

routeHelp

Displays a list of FSPF-related commands.

SYNOPSIS routehelp

DESCRIPTION Use this command to display a list of fabric-shortest-path-first (FSPF)-related commands.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display a list of routing-related commands:

SEE ALSO bcastShow, interfaceShow, uRouteShow

rtLogTrace

Manages real-time trace logging.

SYNOPSIS rtlogtrace -- enable

rtlogtrace --disable

rtlogtrace --show

rtlogtrace --help

DESCRIPTION

Use this command to enable or disable real-time trace logging and to indicate whether the feature is enabled or disabled.

The RTLog facility captures the most recent hardware events and low-level software interrupts on Brocade DCX platforms in real time. When enabled, the RTLog traces are collected as part of the **supportsave** utility. The RTLog generates no console output. The RTLog is enabled by default and persistent across reboots and power cycles.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--enable

Enables the RTLog on the active Control Processor (CP). The RTLog becomes effective on the standby CP after a failover or a reboot of the standby CP.

--disable

Disables the RTLog.

--show

Displays the current status of the RTLog as enabled or disabled.

--help

Displays the command usage.

EXAMPLES

To enable the RTLog:

Switch:admin> rtlogtrace --enable

To disable the RTLog:

Switch:admin> rtlogtrace --disable

To display the RTLog status:

Switch:admin> rtlogtrace --show

SEE ALSO None

secActiveSize

Displays the size of the active security database.

SYNOPSIS secactivesize

DESCRIPTION

Use this command to display the size of the active security database. The command also displays the maximum database size.

For switches running Fabric OS v6.2.0 and later, the maximum security database size is 1 megabyte per logical switch. With up to eight partitions, the total database size on a chassis can be up to 8 megabytes. On switches that are not Virtual Fabric-capable, the security database is limited to 1 megabyte. For switches running earlier versions of Fabric OS (up to v5.3.0), the maximum size is 256 Kilobytes.

NOTES

The effective security DB size is the lowest supported by the fabric. The presence of a Standby CP that runs an earlier version of the operating system will drop the effective security DB size on an Active CP that runs Fabric OS v6.2.0.

The Brocade 200E is unable to handle the maximum DB size supported in v6.2.0 and issues a compact flash warning when the active security database is close to the 1 MB limit.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the size of the active security database:

```
switch:admin> secactivesize
   Size of security active data: 35 bytes \
   (Max 1048576 bytes)
```

SEE ALSO secDefineSize, secGlobalShow

secAuthSecret

Manages the DH-CHAP shared secret key information.

SYNOPSIS secauthsecret --show

secauthsecret --set

secauthsecret --remove value | --all

DESCRIPTION

Use this command to manage the DH-CHAP shared secret key database used for authentication. This command displays, sets, and removes shared secret key information from the database or deletes the entire database. If you are performing set or remove operations, when the command is completed new data is saved persistently. New data is effective with the next authentication request. The configuration applies to a switch instance only.

Port level authentication security must be enabled before encryption configuration can be enabled. Pre-shared secret keys should be configured on both ends of the ISL to perform authentication. For encrypted ports, an authentication key of 32 characters is recommended. Spaces are not allowed.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--show

Lists the WWNs for which a shared secret is configured.

--set

Sets shared secrets with a WWN. This command is interactive. When setting secrets for an entry of an EX_Port, the WWN of the entry must be specified. Spaces are not allowed.

--remove [wwn | domain | swname]

Removes the specified WWN entry from the database. If a domain name is specified, it is converted to a WWN and then the entry is removed. When removing an entry of an EX_Port type, the WWN of the entry must be specified. If no option is specified, the command is interactive.

--remove --all

Deletes the entire secret key database.

EXAMPLES

To list the shared secret WWN:

```
switch:admin> secauthsecret --show
```

NWN	DId	Name
10:00:00:60:69:80:5b:e8	1	switch

To set the shared secret:

```
switch:admin> secAuthSecret --set
```

This command sets up secret keys for the DH-CHAP authentication. The minimum length of a secret key is 8 characters and maximum 40 characters. Setting up secret keys does not initiate DH-CHAP

authentication. If switch is configured to do DH-CHAP, it is performed whenever a port or a switch is enabled.

Warning: Please use a secure channel for setting secrets. Using an insecure channel is not safe and may compromise secrets.

Following inputs should be specified for each entry.

- 1. WWN for which secret is being set up.
- 2. Peer secret: The secret of the peer that authenticates to peer.
- 3. Local secret: The local secret that authenticates peer.

Press Enter to start setting up shared secrets >

```
Enter WWN, Domain, or switch name (Leave blank when done):
10:00:00:60:69:80:05:14
Enter peer secret:
Re-enter peer secret:
Enter local secret:
Re-enter local secret:
Enter WWN, Domain, or switch name (Leave blank when done):
Are you done? (yes, y, no, n): [no] y
Saving data to key store... Done.
```

To delete the entire secret key database:

```
This command deletes database of DH-CHAP secret keys.
If a fabric requires authentication, deleting this
database may cause switch to segment from the fabric.
```

Do want to remove secret key database? (yes, y, no, n): [no] y Deleting secret key database... Done.

switch:admin> secAuthSecret --remove --all

SEE ALSO None

secCertUtil

Manages certificates on a switch.

[-remotedir remote directory] [-certname certificate name]

[-login login name] [-password password]

seccertutil show [-ldapcacert] | [-fcapall] | [-fcapswcert] | [filename]

DESCRIPTION

Use this command to manage third-party certificates on a switch, including Public Key Infrastructure (PKI) based certificates, Lightweight Directory Access Protocol (LDAP) certificates, and FCAP certificates. This command also imports or exports Certificate Signing Requests (CSRs) from or to a remote host. This command supports IPV4 and IPV6 addresses.

Use this command to do the following:

- Generate a public/private key pair.
- Delete a public/private key pair.
- Generate a CSR.
- Delete a CSR.
- List existing certificates on a switch.
- Display the contents of a certificate or CSR.
- Delete a specified certificate.
- Import or export a certificate.

- Configure a SSL certificate file name.
- Enable secure protocols.

This command takes an action and associated arguments. If only an action is specified, this command prompts interactively for input values of the associated arguments. The command runs noninteractively when the arguments associated with a given action are specified on the command line. When invoked without operands, this command displays the usage.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Before you import a certificate from Windows system, convert the certificate to a Unix file format with the dos2unix utility.

OPERANDS

This command has the following operands:

genkey

Generates a public/private key pair. This is the first step in setting up a third-party certificate. The following operands are optional; when omitted, the command prompts interactively for input values to these operands.

-keysize 1024 | 2048

Specifies the size of the key. Valid values are 1024 or 2048. bits. The greater the value, the more secure is the connection; however, performance degrades with size. The keys are generated only after all existing CSRs and certificates have been deleted.

-nowarn

Specifies that no warning is given when overwriting or deleting data. If this operand is omitted, the command prompts for confirmation before existing CSRs and certificates are deleted.

delkey

Deletes all public/private key pairs with the exception of Encryption-related certificates and key pairs. This command prompts for confirmation unless -nowarn is specified.

-nowarn

Executes the delete operation without confirmation.

-all

Deletes all public/private key pairs including Encryption-related certificates and key pairs.

gencsr

Generates a new CSR for the switch. This is the second step in setting up a third-party certificate. The following operands are optional; if omitted, the command prompts for answers to a series of questions. If only one or a few operands are specified. the command prompts for input to the remaining questions. When all questions are answered, a CSR is generated and placed in a file named *ip_address.csr*, where *ip_address* is the IP address of the switch.

-country country code

Specifies the country. Provide a two-letter country code, for example, US.

-state state

Specifies the state. Provide the full name, for example, California. If the state consists of multiple words, it must be enclosed in double quotes.

-locality locality

Specifies the city. Provide the full name, for example, "San Jose". If the locality consists of multiple words, it must be enclosed in double quotes.

-org organization

Specifies the organization. Provide the full name, for example, Brocade. If the organization consists of multiple words, it must be enclosed in double quotes.

-orgunit organization unit

Specifies the organizational unit, for example, your department name. If the organizational unit consists of multiple words, it must be enclosed in double quotes.

-cn common name

Specifies the common name. Provide a fully qualified Domain Name, or IP address.

showcsr

Displays the content of the CSR on the switch without page breaks. Use the pipe operator followed by the "more" option to display the content one page at a time.

delcsr [-nowarn]

Deletes the CSR. This command prompts for confirmation before deleting the CSR unless **-nowarn** is specified.

generate -fcapall

Generates FCAP switch CSR, passphrase, and key.

-keysize 1024 | 2048

Specifies the size of the key. Valid values are 1024 or 2048. bits. The greater the value, the more secure is the connection; however, performance degrades with size.

delete

Deletes the specified certificate. Specify one of the following operands:

-Idapcacert

Deletes all LDAP CA certificates. You must specify a file name when deleting the LDAP CA certificates. All LDAP certificates are concatenated in a single file. Use **show -ldapcacert** to list that file name on the switch. You cannot delete an individual certificate.

-fcapcacert

Deletes the FCAP CA certificate.

-fcapswcert

Deletes the FCAP SW certificate.

-fcapall

Deletes all FCAP objects including the switch CSR, keys, pass phrase, Root CA certificate, and switch certificate.

-nowarn

Deletes the specified file without confirmation. This operand is optional.

export

Exports a CSR to a host. This command is typically used to submit a CSR to the Certification Authority (CA) that issues the certificate. The following operands are optional; if omitted, the command prompts interactively for your input.

-Idapcacert -certname certificate name

Exports an LDAP CA certificate from the switch to a remote host. You must specify the name of the LDAP CA certificate to be exported. Use the **show** option for a list of existing certificates.

-fcapswcert

Exports the FCAP switch certificate from the switch to the remote host. The certificate is exported with the same filename it had when it was imported.

-fcapswcsr

Exports the FCAP switch CSR certificate from the switch to the remote host. The FCAP switch CSR is exported as switchIPfcapSw.csr.

-fcapcacert

Exports the FCAP CA certificate from the switch to the remote host. The FCAP CA certificate is exported as switchIPfcapRootCA.pem.

-protocol ftp | scp

Specifies the protocol as either FTP or SCP.

-ipaddr IP address

Specifies the IP address of the remote host.

-remotedir remote directory

Specifies the remote directory. Provide a fully qualified path name.

-login login name

Specifies the login name for the server.

-password password

Specifies the password for the user account. When using SCP, for security reasons, do not enter a password on the command line. Use the interactive version instead.

import

Imports a certificate. Use this command to import a certificate from the server or to download a certificate issued by a CA after sending the CSR to the CA. Specify one of the following certificates:

-Idapcacert

Imports an LDAP CA certificate.

-fcapswcert

Imports an FCAP switch certificate.

-fcapcacert

Imports an FCAP CA certificate.

-config cacert

Imports a CA certificate.

-config swcert [-nowarn]

Imports an SSL certificate. If -nowarn is specified, the SSL certificate import is blocked without warning if the certificate is invalid. If **-nowarn** is omitted, you are prompted for confirmation before importing an invalid switch certificate. However, you will be able to import the invalid certificate. The -nowarn option effectively prevents you from importing an invalid swcert certificate.

-enable https

Enables secure https. Optionally use this operand with **-config swcert** only.

The following operands are optional with import; if omitted, the command prompts interactively for your input.

-protocol ftp | scp

Specifies the protocol as either FTP or SCP.

-ipaddr IP address

Specifies the IP address of the remote host.

-remotedir remote directory

Specifies the remote directory. Provide a fully qualified path name.

-certname certificate name

Specifies the certificate name.

-login login name

Specifies the login name for the server.

-password password

Specifies the password for the user account. When using SCP, for security reasons, do not enter a password on the command line. Use the interactive version instead.

show

Lists all existing PKI-based certificates on the switch. The following operands are optional and exclusive.

-Idapcacert

Lists all existing LDAP CA certificates on the switch..

-fcapall

Indicates whether FCAP-related files exist or are empty.

-fcapswcert

Displays the contents of the FCAP SW certificate.

filename

Displays the contents of the specified certificate.

EXAMPLES To generate a public/private key pair in interactive mode:

```
switch:admin> seccertutil genkey
```

```
Generating a new key pair will automatically do the following:

1. Delete all existing CSRs.

2. Delete all existing certificates.

3. Reset the certificate filename to none.

4. Disable secure protocols.

Continue (yes, y, no, n): [no] y
Select key size [1024 or 2048]: 1024
Generating new rsa public/private key pair
Done.
```

To generate a public/private key pair in noninteractive mode:

```
switch:admin> seccertutil genkey -nowarn -keysize 1024 Generating new rsa public/private key pair Done.
```

To generate a CSR in interactive mode:

```
switch:admin> seccertutil gencsr
Country Name (2 letter code, eg, US):US
State or Province Name (full name, \
    eg, California):California
Locality Name (eg, city name):San Jose
Organization Name (eg, company name):Brocade
Organizational Unit Name (eg, department \
    or section name): IT
Common Name (Fully qualified Domain Name, \
    or IP address):192.168.38.206
generating CSR, file name is: 192.168.38.206.csr
Done
```

To generate a CSR in noninteractive mode:

```
switch:admin> seccertutil gencsr -country US \
     -state California -locality "San Jose" \
     -org Brocade -orgunit software -cn 192.168.38.206
generating CSR, file name is: 192.168.38.206.csr
```

To delete the CSR in interactive mode:

```
switch:admin> seccertutil delcsr
WARNING!!!
About to delete CSR: 192.168.163.238.csr
ARE YOU SURE (yes, y, no, n): [no] y
```

To delete a CSR in noninteractive mode:

```
switch:admin> seccertutil delcsr -nowarn
```

To import an LDAP certificate from a remote host to the local switch in interactive mode:

```
switch:admin> seccertutil import -ldapcacert
Select protocol [ftp or scp]: ftp
Enter IP address: 195.168.38.206
Enter remote directory: /users/home/remote_certs
Enter certificate name (must have ".crt",\
    ".cer" or ".pem" suffix): ldap.cer
Enter Login Name: mylogin
 Enter Password: password
 Success: imported certificate [ldap.cert].
```

To import an LDAP certificate from a remote host to the local switch in noninteractive mode:

```
switch:admin> seccertutil import -ldapcacert \
     -protocol ftp -ipaddr 195.168.38.206 \
     -remotedir /users/home/remote_certs -certname ldap.cer \
     -login abcd -passwd passwd
Success: imported certificate [ldap.cert].
```

To import an FCAP switch certificate in interactive mode:

```
switch:admin> seccertutil import -fcapswcert
Select protocol [ftp or scp]: scp
Enter IP address: 10.32.2.25
Enter remote directory: /users/myname/OPENSSL
Enter certificate name (must have ".crt" or
   ".cer" ".pem" or ".psk" suffix):01.pem
Enter Login Name: myname
myname@10.32.2.25's password:
 Success: imported certificate [01.pem].
```

To import an FCAP CA certificate in interactive mode:

```
switch:admin> seccertutil import -fcapcacert
Select protocol [ftp or scp]: scp
Enter IP address: 10.32.2.25
Enter remote directory: /users/myname/OPENSSL
Enter certificate name (must have ".crt" or
    ".cer" ".pem" or ".psk" suffix):CACert.pem
Enter Login Name: myname
myname@10.32.2.25's password:
Success: imported certificate [CACert.pem].
```

To import a PKI-based certificate with configure and enable option in interactive mode:

```
switch:admin> seccertutil import -config swcert -enable https
Select protocol [ftp or scp]: ftp
Enter IP address: 192.168.38.206
Enter remote directory: /users/home/mycerts
Enter certificate name (must have ".crt", ".cer"\
   or ".pem" suffix): filename
Enter Login Name: username
Enter Password: password
Success: imported certificate [filename].
Certificate file in configuration has been updated.
Secure http has been enabled.
```

To import a PKI-based certificate with configure and enable option in noninteractive mode:

```
switch:admin> seccertutil import -config swcert \
    -enable https -protocol ftp -ipaddr 195.168.38.206 \
    -remotedir /users/home/remote_certs -certname file.crt \
    -login abcd -password passwd
Success: imported certificate [file.crt].
    Certificate file in configuration has been updated.
    Secure http has been enabled.
```

To export an LDAP CA certificate from the local switch to a remote host in interactive mode:

```
switch:admin> seccertutil export -ldapcacert
Select protocol [ftp or scp]: scp
Enter IP address: 192.168.38.206
Enter remote directory: /users/home/remote/mycerts
Enter Login Name: username
Enter LDAP certificate name (must have ".pem" \
    suffix):ldap.cer
Password:password
Success: exported LDAP certificate
```

To export an LDAP CA certificate from the local switch to a remote host in noninteractive mode:

```
switch:admin> seccertutil export -ldapcacert
   -protocol ftp -ipaddr 192.168.38.206 \
   -remotedir /users/home/remote_certs \
   -login abcd -passwd passwd -certname ldap.cer
Success: exported LDAP certificate
```

To export an FCAP switch certificate in interactive mode:

```
switch:admin> seccertutil export -fcapswcert
Select protocol [ftp or scp]: scp
Enter IP address: 10.32.2.25
Enter remote directory: /users/myname/OPENSSL
Enter Login Name: myname
myname@10.32.2.25's password:
Success: exported FCAP switch certificate
```

To export an FCAP switch CSR in interactive mode:

```
switch:admin> seccertutil export -fcapswcsr
Select protocol [ftp or scp]: scp
Enter IP address: 10.32.2.25
Enter remote directory: /users/myname/OPENSSL
Enter Login Name: myname
myname@10.32.2.25's password:
Success: exported FCAP switch CSR
```

To delete an LDAP CA certificate in interactive mode:

```
switch:admin> seccertutil delete -ldapcacert filename.pem
WARNING!!!
About to delete certificate: filename.cer
ARE YOU SURE (yes, y, no, n): [no] y
Deleted LDAP certificate successfully
```

To delete an LDAP CA certificate in noninteractive mode:

```
switch:admin> seccertutil delete -ldapcacert filename.pem
Deleted LDAP certificate successfully
```

To delete all FCAP PKI objects:

```
switch:admin> seccertutil delete -fcapall
WARNING!!!
About to delete FCAP-Files:
ARE YOU SURE (yes, y, no, n): [no] y
```

To generate FCAP PKI objects:

```
switch:admin> seccertutil generate \
    -fcapall -keysize 1024
Generating a new key pair will automatically
do the following:
1. Delete all existing CSRs.
2. Delete existing switch certificate.
3. Reset the certificate filename to none.
Continue (yes, y, no, n): [no] y
 Installing Private Key and Csr...
 Switch key pair and CSR generated...
```

To display the FCAP PKI objects:

switch:admin> seccertutil show -fcapall
List of fcap files:
Passphrase : Exist
Private Key : Exist
CSR : Exist
Certificate : Empty
Root Certificate: Exist

To list all LDAP certificates on a switch:

```
switch:admin> seccertutil show -ldapcacert
List of ldap ca certificate files:
Sample.cer
```

To display the content of the CSR one page at a time:

```
switch:admin> seccertutil showcsr | more
```

To display the contents of an FCAP SW certificate:

```
switch:admin> seccertutil show -fcapswcert
```

To display the contents of a PKI-based or LDAP CA certificate:

switch:admin> seccertutil show filenname

SEE ALSO None

secDefineSize

Displays the size of the defined security database.

SYNOPSIS secdefinesize

DESCRIPTION

Use this command to display the size of the defined security database. The command also displays the maximum database size.

For switches running Fabric OS v6.2.0 and later, the maximum security database size is 1 Megabyte per logical switch. With up to eight partitions, the total database size on a chassis can be up to 8 Megabytes. On switches that are not Virtual Fabric-capable, the security database is limited to 1 Megabyte. For switches running earlier versions of Fabric OS (up to v5.3.0), the maximum size is 256 Kilobytes.

The effective security DB size is the lowest supported by the fabric. The presence of a Standby CP that runs an earlier version of the operating system drops the effective security DB size on an Active CP that runs Fabric OS v6.2.0 or later.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display the size of the defined security database

> switch:admin> secdefinesize Size of security defined data: 35 bytes \ (Max 1048576 bytes)

SEE ALSO secActiveSize, secGlobalShow

secGlobalShow

Displays the current internal security state information.

SYNOPSIS secglobalshow

DESCRIPTION

Use this command to display security server-specific information as a snapshot of its current state. The output may include information about the following:

- General security parameters
- The latest zone transaction
- The current status of the RCS transaction
- The state of the Domain
- wwnDL state

This command is intended primarily for debugging purposes by technical support staff. The information displayed may not be supported between releases and is subject to change without notice.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To view the current security state:

```
switch:admin> secglobalshow
----General Security Information----
flag 1, saveflag 0
transId 0

(Output truncated)
```

SEE ALSO secActiveSize, secDefineSize

secHelp

Displays information about security commands.

SYNOPSIS sechelp

DESCRIPTION Use this command to display a list of security commands with a brief description of the commands.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display a list of security commands:

switch:admin> sechelp

fipscfg Configure FIPS mode operation

secactivesize Displays size of the active (security)

database

secauthcertificate Configure FCAP switch certificate properties secauthsecret Creates/Manages DHCHAP secret key details seccertutil Creates/Manages/Displays third party PKI

certificates

secdefinesize Displays size of the defined (security)

database

secglobalshow Displays current internal security state

information

secpolicyabort Aborts changes to defined policy

secpolicyactivate Activates all policy sets

secpolicyadd Adds members to an existing policy

secpolicycreate Creates a new policy

secpolicydelete Deletes an existing policy

secpolicydump Displays all members of existing policies

secpolicyfcsmove Moves a member in the FCS policy

secpolicyremove Removes members from an existing policy secpolicysave Saves defined policy set and sends to all

switches

secpolicyshow Shows members of one or more policies

secstatsreset Resets security statistics secstatsshow Displays security statistics

sshutil Configure SSH authentication options

SEE ALSO None

secPolicyAbort

Aborts all unsaved changes to the defined database.

SYNOPSIS secpolicyabort

DESCRIPTION Use this command to abort all changes to the defined security database that have not been saved to

flash memory and to abort changes to policy creation and modification operations from all the switches if

a fabric-wide consistency policy is not set for the particular policy.

NOTES When an FCS policy is enabled, this command can be issued only from the Primary FCS switch.

Only the user who made the changes to the defined database may use this command to abort them.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To abort all changes that have not been saved to nonvolatile memory:

> primaryfcs:admin> secpolicyabort Unsaved data has been aborted. primaryfcs:admin> secpolicyabort

No new data to abort.

SEE ALSO secPolicyActivate, secPolicyAdd, secPolicyDelete, secPolicyDump, secPolicyRemove,

secPolicySave, secStatsShow

secPolicyActivate

Saves and activates the Defined Security Policy Set.

SYNOPSIS secpolicyactivate

DESCRIPTION

Use this command to activate the current defined security policy to all switches in the fabric. This activates the policy set on the local switch or all switches in the fabric depending on the fabric-wide consistency policy.

If there are changes to the SCC, DCC, or FCS policies in the current CLI or API transaction that have not been saved to the Defined Security Policy Set, then this command saves the changes to the Defined Security Policy Set first, and then activates it. If there are no changes, but the Defined Security Policy Set differs from the Active Security Policy Set, then the Defined Security Policy Set is activated. If there are no changes and the Defined Security Policy Set is the same as the Active Security Policy Set, then nothing is done.

After activation the defined policy set becomes the Active Policy Set.

Use **secPolicyShow** to display the members of an existing policy in the Active or Defined Security Policy Sets.

NOTES

The behavior of this command is the same for tolerant and strict fabric-wide consistency.

When an FCS policy is enabled, this command can be issued only from the Primary FCS switch.

Any modifications to the SCC, DCC, and FCC DB are saved and activated. When **secPolicyActivate** is issued after the **secPolicySave** command, it might fail.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To activate the defined security policy set on all switches in the fabric:

```
switch:admin> secpolicyactivate
About to overwrite the current Active data.
ARE YOU SURE (yes, y, no, n): [no] y
secpolicyactivate command was completed successfully.
```

SEE ALSO

fddCfg, secPolicyAbort, secPolicyAdd, secPolicyDelete, secPolicyDump, secPolicyRemove, secPolicySave, secPolicyShow

secPolicyAdd

Adds members to an existing security policy.

SYNOPSIS secpolicyadd "name", "member[;member...]"

DESCRIPTION

Use this command to add one or more members to an existing access policy.

Each policy corresponds to a management method. The list of members of a policy acts as an access control list for that management method. Before a policy is created, there is no enforcement for that management method; all access is granted. After a policy has been created and a member has been added to the policy, that policy becomes closed to all access except from included members. If all members are then deleted from the policy, all access is denied for that management method (the DCC POLICY is an exception).

Attempting to add a member to a policy that already is a member causes this command to fail.

In a Virtual Fabric Environment, when you create a DCC lockdown policy on a logical switch, the DCC policy is created for each port in the chassis, even though the ports are not currently present in the local logical switch. This is done to provision the DCC policy for the ports that may be moved later. If a policy seems stale at any point, use secPolicyDelete to remove all stale DCC policies.

Fabric-wide consistency policies can be configured on per logical switch basis, which applies the FCS policy to the corresponding fabric connecting to the logical switch. Automatic policy distribution for DCC, SCC and FCS remains unchanged in Fabric OS v6.2.0 and can be configured on a per logical switch basis.

NOTES

When an FCS policy is enabled, this command can be issued only from the Primary FCS switch. The secpolicyadd command can be issued on all switches for SCC and DCC policies as long as fabric-wide consistency policy is not set for the particular policy.

Do not add the WWNs of front or translate (xlate) domains to the FCS policy if the edge fabric is connected to an FC Router.

Backup FCS switches typically cannot modify the policy. However, if the Primary FCS switch in the policy list is not reachable, then a backup FCS switch is allowed to modify the policy. If all the reachable backup FCS switches are running pre-v5.3.0 versions of Fabric OS, a non-FCS v5.3.0 switch is allowed to modify the policy so that a new switch can be added to the policy.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

"name"

Specify the name of an existing policy to which you want to add members. Valid values for this operand include the following:

- DCC_POLICY_nnn
- FCS_POLICY
- SCC POLICY

The specified policy name must be capitalized.

The DCC_POLICY_nnn name has the common prefix DCC_POLICY_ followed by a string of user-defined characters. These characters do not have to be capitalized like regular policy names, but they are case-sensitive.

"member"

Specify a list of one or more member switches to be included in the security policy. The list must be enclosed in quotation marks; members must be separated by semicolons. Depending on the policy type, members are specified as follows.

FCS POLICY or SCC POLICY Members

This policy type requires member IDs to be specified as WWN strings, Domains, or switch names. If Domain IDs or switch names are used, the switches associated must be present in the fabric or the command fails.

DCC_POLICY Members

The DCC_POLICY_nnn is a list of device port names associated with a specific switch and port index combination. An empty DCC_POLICY does not stop access to the switch. The device port name is specified by its port WWN string. The switch and port index combination must be in the switch port format, where switch can be specified as a WWN, a domain, or a switch name, and port is specified by port numbers separated by commas and enclosed in either brackets or parentheses; for example, (2, 4, 6). Ports enclosed in brackets include the devices currently attached to those ports.

The following examples illustrate several ways to specify the port values:

(1-6)

Selects ports 1 through 6.

(*)

Selects all ports on the switch.

[3, 9]

Selects ports 3 and 9 and all devices attached to those ports.

[1-3, 5]

Selects ports 1 through 3 and 5 and all devices attached to those ports.

[*]

Selects all ports on the switch and devices currently attached to those ports.

EXAMPLES To

To add a member to the SCC_POLICY using the device WWN:

To add two devices to attach to domain 3, ports 1 and 3, in an existing empty DCC policy; the port WWN of the first device is 11:22:33:44:55:66:77:aa and port WWN of the second device is 11:22:33:44:55:66:77:bb:

```
primaryfcs:admin> secpolicyadd "DCC_POLICY_abc", \
    "11:22:33:44:55:66:77:aa;11:22:33:44:55:66:77:bb;3(1,3)"
Member(s) have been added to DCC_POLICY_abc.
```

SEE ALSO

distribute, fddCfg, secPolicyAbort, secPolicyActivate, secPolicyDelete, secPolicyDump, secPolicyRemove, secPolicySave

secPolicyCreate

Creates a new security policy.

SYNOPSIS secpolicycreate "name" [, "member[;member...]"]

DESCRIPTION

Use this command to create a new policy and to edit Switch Connection Control (SCC), Device Connection Control (DCC), and Fabric Configuration Server (FCS) policies on the local switch. All policies can be created only once, except for the DCC_POLICY_nnn. Each DCC_POLICY_nnn must have a unique name. This command can be issued on all switches in the current fabric for SCC and DCC policies if they are not intended to be fabric-wide.

Adding members while creating a policy is optional. You can add members to a policy later, using the secPolicyAdd command.

Each policy corresponds to a management method. The list of members of a policy acts as an access control list for that management method. Before a policy is created, there is no enforcement for that management method, which is all access is granted. After a policy is created and a member is added to the policy, that policy is closed to all access except to included members. If all members are then deleted from the policy, all access is denied for that management access method.

All newly created policies are saved on the local switch only, unless the switch has a fabric-wide consistency policy for that policy.

In a Virtual Fabric environment, when you create a DCC lockdown policy on a logical switch, the DCC policy is created for each port in the chassis, even though the ports are not currently present in the local logical switch. This is done to provision the DCC policy for the ports that may be moved later. If a policy seems stale at any point, use the secPolicyDelete command to remove all stale DCC policies.

Fabric wide consistency policies can be configured on a logical switch basis, which applies the FCS policy to the corresponding fabric connecting to the logical switch. Automatic policy distribution behavior for DCC, SCC and FCS remains unchanged in Fabric OS v6.2.0 or later and can be configured on a logical switch basis.

NOTES

When an FCS policy is enabled, this command can be issued only from the Primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

"name"

Specify the name of the policy you want to create. Valid values for this operand include the following:

- DCC POLICY nnn
- SCC_POLICY
- FCS POLICY

The specified policy name must be capitalized.

The DCC_POLICY_nnn name has the common prefix DCC_POLICY_followed by a string of user-defined characters. These characters do not have to be capitalized like regular policy names. Valid values for DCC_POLICY_nnn are user-defined alphanumeric or underscore characters. The maximum length is 30 characters, including the prefix DCC_POLICY_.

secpolicycreate DCC_POLICY "*" may be used to indicate DCC lockdown. This command creates a unique policy for each port in the fabric locking it down to the device connected or creating an empty policy to disallow any device to be connected to it. This can be done only when there are no other DCC policies defined on the switch. The switch must be in an enabled state for DCC lockdown to succeed. On a disabled switch, executing **secpolicycreate** DCC_POLICY "*" will not create any DCC policies.

"member"

Specify one or more members to be included in the security policy. The member list must be enclosed in double quotation marks and members separated by semicolons. The member list must be separated from the name field by a comma and a space. Depending on the policy type, members are specified as follows:

DCC POLICY Members

The DCC_Policy_nnn is a list of devices associated with a specific switch and port index combination. An empty DCC_POLICY does not stop access to the switch. The device is specified by its port WWN. The switch and port combination must be in the switch *port* format.

switch can be specified using a WWN, domain, or switch name.

port can be specified by port numbers separated by commas and enclosed in either brackets or parentheses: for example, (2, 4, 6). Ports enclosed in brackets include the devices currently attached to those ports.

The following examples illustrate several ways to specify the port values:

(1-6)

Selects ports 1 through 6.

(*)

Selects all ports on the switch.

[3, 9]

Selects ports 3 and 9 and all devices attached to those ports.

[1-3, 5]

Selects ports 1 through 3 and 5 and all devices attached to those ports.

[*]

Selects all ports on the switch and devices currently attached to those ports.

SCC_POLICY and FCC_POLICY Members

This policy type requires member IDs to be specified as WWN strings, domains, or switch names. If domain or switch names are used, the switches associated must be present in the fabric or the command fails.

To add all switches in the current fabric as members of the policy, enter an asterisk enclosed in quotation marks (*) as the member value. This feature cannot be used by the other security commands.

EXAMPLES

To create an FCS policy (While creating the FCS policy, the local switch WWN is automatically included in the list. Switches included in the FCS list are FCS switches and the remaining switches in the fabric are non-FCS switches. Out of the FCS list, the switch that is in the first position becomes the Primary FCS switch and the remaining switches become backup FCS switches. If the first switch in the FCS list is not reachable, the next switch becomes the Primary):

```
primaryfcs:admin> secpolicycreate "FCS_POLICY", "3; 4"
FCS_POLICY has been created.
```

To create a device policy to allow two devices to attach to domain 3 ports 1 and 3 (the WWN of first device is 11:22:33:44:55:66:77:aa and the WWN of second device is 11:22:33:44:55:66:77:bb):

```
primaryfcs:admin> secpolicycreate "DCC POLICY aB 7", \
     "11:22:33:44:55:66:77:aa;11:22:33:44:55:66:77:bb;3[1,3]"
DCC POLICY abc has been created.
```

To create a SCC policy in a fabric with three switches:

Check if a policy exists.

switch:admin> secpolicyshow

```
ACTIVE POLICY SET
DEFINED POLICY SET
```

2. Identify switches in the fabric.

```
switch:admin> fabricshow
Switch ID Worldwide Name
                            Enet IP Addr FC IP Addr Name
______
2:fffc02 10:00:00:05:1e:39:5f:67 10.32.69.53 10.20.30.53 "sw1"
                       fec0:60:69bc:60:260:69ff:fe80:d4a
4:fffc04 10:00:00:05:le:04:ef:0e 10.32.69.49 10.20.30.49 'sw2"
                        fec0:60:69bc:54:205:1eff:fe04:ef0e
200: fffcc8 10:00:00:05:1e:35:cd:ef 10.32.69.117 10.20.30.117 \
                                "nSW4100_98"
```

3. Create a SCC policy that includes switches with domain IDs 2 and 4.

```
switch:admin> secpolicycreate "SCC_POLICY","2;4"
SCC_POLICY has been created.
```

4. Activate the policy.

```
switch:admin> secpolicyactivate
About to overwrite the current Active Policy Set.
ARE YOU SURE (yes, y, no, n): [no] y
secpolicyactivate command was completed successfully.
```

To create an SCC policy that includes all switches in the fabric:

```
switch:admin> secpolicycreate "SCC_POLICY",*
SCC_POLICY has been created.
```

fddCfg, distribute, secPolicyAbort, secPolicyActivate, secPolicyAdd, secPolicyDelete, secPolicyDump, secPolicyRemove, secPolicySave, secStatsShow

secPolicyDelete

Deletes an existing security policy.

SYNOPSIS secpolicydelete name

DESCRIPTION

Use this command to delete an existing security policy from the defined security database. Run **secPolicyActivate** to delete the policies from the active security policy list. Deleting a security policy does not cause any traffic disruption.

Each policy corresponds to a management method. The list of members of a policy acts as an access control list for that management method. Before a policy is created, there is no enforcement for that management method; all access is granted. After a policy has been created and a member has been added to the policy, that policy becomes closed to all access except from included members. If the policy is deleted all access is granted.

NOTES

When an FCS policy is enabled, this command can be issued only from the Primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operand is required:

"name"

Specify the name of a security policy to delete. The policy name must be capitalized. Quotation marks are optional. Once a security policy is deleted, fabric-wide switch access through that method is unrestricted. Valid security policy names include the following:

DCC_POLICY_nnn

Deletes the specified Device Connection Control (DCC) policy. The DCC_POLICY_nnn name has the common prefix DCC_POLICY_ followed by a string of user-defined characters. These characters do not have to be capitalized.

ALL_DCC_POLICY

Deletes all DCC policies from the defined policy list.

ALL_STALE_DCC_POLICY

Deletes all stale DCC policies from the defined policy list. DCC policies become stale when the ports are removed from a logical switch.

SCC_POLICY

Deletes the Switch Connection Control policy from the defined policy list.

FCS_POLICY

Deletes the Fabric Configuration Server policy from the defined policy list.

EXAMPLES To delete an existing security policy:

```
switch:admin> secpolicydelete "DCC_POLICY_abl"
About to delete policy DCC_POLICY_abl.
Are you sure (yes, y, no, n):[no] y
DCC_POLICY has been deleted.
```

To delete all existing DCC policies in the fabric:

```
primaryfcs:admin> secpolicydelete ALL_DCC_POLICY
  About to clear all the DCC policies
  ARE YOU SURE (yes, y, no, n): [no] y
```

To delete all stale DCC policies in the fabric:

```
primaryfcs:admin> secpolicydelete ALL_STALE_DCC_POLICY
About to clear all STALE DCC policies
ARE YOU SURE (yes, y, no, n): [no] y
```

SEE ALSO secPolicyAbort, secPolicyActivate, secPolicyAdd, secPolicyCreate, secPolicyDump, ${\tt secPolicyRemove}, {\tt secPolicySave}, {\tt secPolicyShow}$

secPolicyDump

Displays the members of one or all existing security policies.

SYNOPSIS secpolicydump ["listtype"][,"name"]

DESCRIPTION

Use this command to display, without page breaks, the members of an existing policy in the active and defined (saved) databases. When issued without operands, this command displays the members of all security policies.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command can be issued from all FCS switches in the fabric.

OPERANDS

This command has the following optional operands:

"listtype"

Specifies the database to display, enclosed in double quotation marks. The name for an active database is "Active"; the name for a saved, defined database is "Defined". If *listtype* is not specified, all databases are displayed.

"name"

Specifies the security policy for which to display the members. Valid values for this operand include the following:

- DCC_POLICY_nnn
- FCS_POLICY
- SCC_POLICY

The specified policy name must be capitalized and enclosed in double quotation marks.

The DCC_POLICY_nnn name has the common prefix DCC_POLICY_ followed by a string of user-defined characters. These characters do not have to be capitalize. If *name* is not specified, all existing policies are displayed.

EXAMPLES

To display all security policy information from all databases without page breaks:

```
switch:admin> secpolicydump
  ACTIVE POLICY SET

secPolicyFCSMove

Moves a member in the FCS policy.

SYNOPSIS

secpolicyfcsmove [from, to]

DESCRIPTION

Use this command to move an FCS member from one position to another position in the FCS list. Only one FCS can be moved at a time. The first FCS switch in the list that is also present in the fabric is the Primary FCS.

NOTES

If a backup FCS is moved to the first position, it becomes the primary FCS after activation.

An FCS policy must be enabled to execute this command, and the command must be issued from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

OPERANDS

This command has the following operands:

from

Specify the position of the FCS switch you want to move.

to

Specify the position to which you want to move the FCS switch.

EXAMPLES

To move the backup FCS switch from position 2 to position 3 in the FCS list (interactively):

```
switch:admin> secpolicyfcsmove
Pos Primary WWN
                                 DId swName.
______
           10:00:00:60:69:10:02:18 1 switch5.
1

secPolicyAbort, secPolicyActivate, secPolicyAdd, secPolicyCreate, secPolicyDelete, secPolicyDump, secPolicyRemove, secPolicySave, secPolicyShow

secPolicyRemove

Removes members from an existing security policy.

SYNOPSIS secpolicyremove "name", "member[;member...]"

DESCRIPTION

Use this command to remove one or more members from an existing security policy. It is not possible to remove all members from the FCS_POLICY; the local switch WWN cannot be deleted from the FCS policy. In the case of SCC policy, if it is empty after removing all members, all access to the switch itself would be disallowed.

NOTES

If an FCS policy is enabled, this command must be issued from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

"name"

Specify the name of an existing policy you want to remove members from. This operand is required. Valid values for this operand include the following:

- DCC_POLICY_nnn
- FCS_POLICY
- SCC_POLICY

The specified policy name must be capitalized.

The DCC POLICY policy name has the common prefix DCC POLICY followed by a string of user-defined characters. These characters do not have to be capitalized like regular policy names, but are case-sensitive.

"member"

Specify a member or list of members to delete from the policy. The list must be enclosed in quotation marks; members must be separated by semicolons. This operand is required. Depending on the policy type, members can be specified using IP address, WWN, domain, or switch name.

WWN Member Policy Types

The following policy types require members be specified by WWN address:

- FCS_POLICY
- SCC POLICY

These policy types require member IDs be specified as WWN strings, domains, or switch names. If domain or switch names are used, the switches associated must be present in the fabric or the command fails.

DCC_POLICY Members

The DCC_Policy_nnn is a list of devices associated with a specific switch and port combination. The device is specified with a WWN string. The switch and port combination must be specified in the switch port format where switch can be specified by switch WWN, domain, or switch name. The port parameter can be specified by port number separated by commas, and enclosed in either brackets or parentheses: for example, (2, 4, 6). Ports enclosed in brackets include the devices currently attached to those ports.

The following examples illustrate several ways to specify the port values:

(1-6)

Selects ports 1 through 6.

(*)
Selects all ports on the switch.

[3, 9]
Selects ports 3 and 9 and all devices attached to those ports.

[1-3, 5]
Selects ports 1 through 3 and 5 and all devices attached to those ports.

[*]
Selects all ports on the switch and devices currently attached to those ports.

EXAMPLES To remove a member that has a WWN of 12:24:45:10:0a:67:00:40 from SCC policy:

SEE ALSO secPolicyAbort, secPolicyActivate, secPolicyAdd, secPolicyCreate, secPolicyDelete, secPolicyDump, secPolicySave, secStatsShow

secPolicySave

Saves a defined security policy to persistent memory.

SYNOPSIS secpolicysave

details.

DESCRIPTION Use this command to save a defined security policy to persistent memory. SecPolicySave saves the

modified SCC, DCC, and FCS policies to the Defined Security Policy Set on the local switch.

NOTES This command is always a local switch operation. A fabric-wide consistency configuration does not affect

the behavior of this command.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

OPERANDS None

EXAMPLES To save a defined policy set to persistent memory:

switch:admin> secpolicysave

secpolicysave command was completed successfully.

SEE ALSO fddCfg, secPolicyAbort, secPolicyActivate, secPolicyAdd, secPolicyCreate, secPolicyDelete,

secPolicyDump, secPolicyRemove, secStatsShow

secPolicyShow

Displays an existing security policy including the FCS policy.

SYNOPSIS

secpolicyshow ["policy_set"[", name"]]

DESCRIPTION

Use this command to display the members of an existing policy in the Active or Defined security policy set. The command can be issued from all FCS switches.

This command displays the policy database one page at a time. Use the **secPolicyDump** command to display the policy database without page breaks.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

"policy_type"

Specify which policy to display, in quotation marks. Valid values are "Active", "Defined", or an asterisk (*) for both Active and Defined. This operand is optional. If not specified, all databases are displayed.

"name"

Specify the name of the security policy you want to view, in quotation marks. The specified policy name must be capitalized. This operand is optional. Valid values for this operand include the following:

- DCC_POLICY_nnn
- FCS_POLICY
- SCC_POLICY

The DCC_POLICY_nnn name has the common prefix DCC_POLICY_ followed by a string of user-defined characters. These characters do not have to be capitalized like regular policy names, but they are case-sensitive.

EXAMPLES

To display all security policies from active databases:

switch:admin> secpolicyshow "active"

		ACTIVE POLICY SE	
FCS_POL	ICY		
Pos	Prin	nary WWN	DId swName
1	Yes	10:00:00:60:69:30:15:5c	1 primaryfcs
2	No	10:00:00:60:69:30:1e:62	4 switch

To display all security policies from defined databases:

switch:admin> secpolicyshow "defined"

		DEFINED POLICY	
FCS_POL	ICY		
Pos	Prim	ary WWN	DId swName
1	Yes	10:00:00:60:69:30:15:5c	1 primaryfcs
2	No	10:00:00:60:69:30:1e:62	4 switch

fddCfg, secPolicyAbort, secPolicyActivate, secPolicyAdd, secPolicyCreate, secPolicyDelete, secPolicyDump, secPolicyRemove, secPolicySave**SEE ALSO**

secStatsReset

Resets one or all security statistics to 0.

SYNOPSIS secstatsreset [name][,"domain[;domain]"]

DESCRIPTION

Use this command to reset one or all security statistics to 0. This command can be issued on any switch to reset the security statistics on the local switch or chassis. If an FCS policy is enabled and **secStatsReset** is issued on the primary FCS switch, this command can reset security statistics for any or all switches in the fabric.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

When invoked without operands, this command displays the security statistics on the local switch or chassis. The following operands are optional:

name

Specify the name of a security statistic you would like to reset. The specified policy name must be capitalized. If executed on the primary FCS, specify an asterisk (*) to reset all security policies. Valid values for this operand include the following:

- TELNET_POLICY
- HTTP_POLICY
- SCC POLICY
- DCC_POLICY
- LOGIN
- INVALID_CERT
- AUTH FAIL
- TS OUT SYNC
- NO_FCS
- INCOMP_DB
- ILLEGAL CMD

To access DCC policies, enter DCC_POLICY. Violations are not tracked for individual DCC policies. The statistics for all DCC_POLICY violations are grouped together.

domain(s)

Specify a list of domain IDs on which to reset the security statistics. Specify an asterisk (*) to represent all switches in the fabric or specify a list of domains, separated by semicolons and enclosed in quotation marks. This option can only be executed when an FCS policy is enabled and when the command is issued from the primary FCS switch. When domain is specified, the name operand is required.

EXAMPLES To reset all statistics on the local switch:

switch:admin> secstatsreset
About to reset all security counters.
ARE YOU SURE (yes, y, no, n):[no] y
Security statistics reset to zero.

To reset DCC_POLICY statistics on domains 1 and 69:

primaryfcs:admin> secstatsreset DCC_POLICY, "1;69" Reset DCC_POLICY statistic.

SEE ALSO secStatsShow

secStatsShow

Displays one or all security statistics.

SYNOPSIS secstatsshow [name[,"domain[;domain]"]]

DESCRIPTION

Use this command to display one or all security statistics. This command can be issued on any switch to display local security statistics. If an FCS policy is enabled and **secStatsShow** is issued on the primary FCS switch, this command can retrieve and display the security statistics for any or all switches in the fabric.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

When invoked without operands, this command displays the security statistics on the local switch or chassis. The following operands are optional:

name

Specify the name of the security statistic you want to view. The specified policy name must be capitalized. If executed on the primary FCS, specify an asterisk (*) to represent all security policies in the fabric. Valid values for this operand include the following:

- TELNET_POLICY
- HTTP_POLICY
- SCC_POLICY
- DCC_POLICY
- LOGIN
- INVALID_CERT
- AUTH FAIL
- TS OUT SYNC
- NO FCS
- INCOMP_DB
- ILLEGAL CMD

To access DCC policies, enter DCC_POLICY. Violations are not tracked for individual DCC policies. The statistics for all DCC_POLICY violations are grouped together.

domain

Specify one or more domains for which to display the security statistics. Specify an asterisk (*) in quotation marks to represent all switches in the fabric or specify a list of domains separated by semicolons. This option can only be executed when an FCS policy is enabled and the command is issued from the primary FCS switch. When *domain* is specified, the *name* operand is required.

EXAMPLES To display the LOGIN policy statistics for the local domain.

```
switch:admin> secstatsshow LOGIN
Fabric Statistics:
Domain 1:
       Value
Name
_____
```

To display statistic information for TELNET_POLICY for all switches in the fabric from the primary FCS

```
primaryfsc:admin> secstatsshow TELNET_POLICY,"*"
Fabric Statistics:
Domain 1:
          Value
______
TELNET_POLICY
Domain 69:
Name
          Value
-----
TELNET_POLICY
          0
Domain 70:
Name
          Value
_____
TELNET_POLICY 0
```

SEE ALSO secStatsReset

sensorShow

Displays sensor readings.

SYNOPSIS sensorshow

DESCRIPTION

Use this command to display the current temperature, fan, and power supply status and readings from sensors located on the switch. The actual location of the sensors varies, depending on the switch type.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To view all sensor values:

```
switch:admin> sensorshow
sensor 1: (Temperature) is Ok, value is 39 C
sensor 2: (Temperature) is Absent
sensor 3: (Temperature) is Absent
sensor 4: (Temperature) is Absent
sensor 5: (Temperature) is Ok, value is 26 C
sensor 6: (Temperature) is Ok, value is 27 C
sensor 7: (Fan ) is Ok, speed is 2537 RPM
sensor 8: (Fan
                     ) is Ok, speed is 2537 RPM
sensor 9: (Fan
                     ) is Ok, speed is 2556 RPM
sensor 10: (Power Supply ) is Ok
sensor 11: (Power Supply ) is Absent
sensor 12: (Power Supply ) is Ok
sensor 13: (Power Supply ) is Absent
```

SEE ALSO fanShow, tempShow

serDesTuneMode

Configures and displays SerDes values on the Brocade FC8-16.

SYNOPSIS

serdestunemode --set

serdestunemode --reset

serdestunemode --show

serdestunemode --help

DESCRIPTION

Use this command to set the SerDes tuning mode for the Brocade FC8-16 port blade and to display the configuration.

Enabling SerDes tuning mode is indicated under the following conditions:

- You have a Brocade FC8-16 blade installed in slot 2 or in slot 7 (or in both slots) in a DCX-4S chassis with a CR4S-8 core blade.
- You notice increasing numbers of CRC errors on ports 2/0, 2/1, 2/4, 2/5, and 7/1.

Enabling SerDes tuning mode change the SerDes values on the above-mentioned ports in slots 2 and 7 along with their peer ports, provided the port blades are FC8-16s and the peer is a CR4S-8 core blade. SerDes tuning mode changes take effect immediately and are saved persistently.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is applicable only to Brocade FC8-16 blades in slots 2 and/or 7 of a DCX-4S chassis with a CR4S-8 core blade.

OPERANDS

This command has the following operands:

--set

Enables SerDes tuning mode and sets new SerDes values on FC8-16 blades in

slot 2 and 7 and on peer ports in the CR4S-8 core blade.

--reset

Disables SerDes tuning mode and resets SerDes values to default on FC8-16

blades in slots 2 and 7 and on peer ports in the CR4S-8 core blade.

--show

Indicates whether the SerDes tuning mode is enabled or disabled.

--help

Displays the command usage.

EXAMPLES

To enable SerDes tuning mode on a DCX-4S chassis with two FC8-16 blades:

```
switch:admin> serdestunemode --set
serdestunemode is turned on
New serdes values set on slot = 2
New serdes values set on slot = 7
switch:admin> serdestunemode --show
serdestunemode is enabled
```

To disable SerDes tuning mode and reset the SerDes values to defaults:

```
switch:admin> serdestunemode --reset
serdestunemode is turned ff
New serdes values reset on slot = 2
New serdes values reset on slot = 7
switch:admin> serdestunemode --show
serdestunemode is disabled
```

SEE ALSO None

setContext

Sets the logical switch context to a specified FID.

SYNOPSIS setcontext FID

DESCRIPTION

Use this command to set the logical switch context to a specified fabric ID (FID). The FID uniquely defines a partition as a logical switch. Use Iscfg --show -cfg to display currently configured partitions and their FIDs.

A logical switch context defines the boundaries within which a user can execute commands in a Virtual Fabric-aware environment. In a Virtual Fabric-aware environment, all commands are context-specific. When a user executes a switch-wide command, the command applies to the current logical switch

On legacy platforms, or if a logical switch context is not set explicitly, switch commands apply to the default logical switch context (FID 128). When the context is changed, switch-wide commands apply to the new logical switch context.

You must have chassis permissions to access all logical switches in the chassis and to use the setContext command to change the current context to any partition configured on the chassis. A user without chassis permissions can change contexts only within the list of FIDs specified in the user's access permissions. Refer to **userConfig** for more information.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

If a logical switch FID is deleted, users logged in to that switch are logged out.

OPERANDS

This command has the following operand:

FID

Specifies the fabric ID of the logical switch instance for which the context is set.

EXAMPLES

To change the logical switch context to FID 20:

switch:admin> setcontext 20

SEE ALSO IsCfg, userConfig

setDbg

Sets the debug level of the specified module.

SYNOPSIS setdbg [module_name][level]

DESCRIPTION

Use this command to set the debug level of a specified module. Debug levels filter the display of debug messages to the serial console. By default, no debug messages are displayed.

High debug level values can generate a large volume of messages, degrading the system response time. The set of supported modules and their current debug levels are displayed by the command **dbgShow**.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

module_name

Specify the name of the module for which you want to view the debug and verbosity levels. Module names are case-sensitive. This operand is optional; if omitted, this command displays the debug and verbose level for all modules.

level

Specify the debug level for the specified module (0 to 9). A zero (0) value (default) specifies that no messages are to display. Higher values cause more messages from that module to display. This operand is optional; if omitted, this command displays the current debug and verbose level of the specified module.

EXAMPLES

To set the debug level for a module named NS to value 3:

SEE ALSO dbgShow

setVerbose

Specifies module verbose level.

SYNOPSIS setverbose [module_name][level|

DESCRIPTION Use this command to set the verbose level of the specified module. These levels filter the display of the

debug message to the serial console. By default, no debug messages are displayed.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

module_name

Specify the name of the module for which the verbose level is to be set; module

names are case-sensitive.

level

Specify the verbose level (0 to 9).

EXAMPLES To set the verbose level of a module named NS to value 3:

> switch:admin> setverbose NS 3 switch:admin> dbgshow NS

Module NS, debug level = 0, verbose level = 3

SEE ALSO dbgShow, setDbg

sfpShow

Displays Small Form-factor Pluggable (SFP) information.

SYNOPSIS

sfpshow

sfpshow [slot/]geport [-f]

sfpshow -all

sfpshow -health

DESCRIPTION

Use this command to display information about Serial Identification SFPs (also known as module definition "4" SFPs). These SFPs provide extended information that describes the SFP capabilities, interfaces, manufacturer, and other information.

Use this command without operands to display a summary of all SFPs in the switch. For each port, the summary displays the SFP type and, for serial ID SFP, the vendor name and SFP, serial number, and speed capability (in Gbps). Refer to **switchShow** for an explanation of the two-letter codes.

Use this command with a port number to display detailed information about the serial ID SFP in the specified port. In this mode, this command displays values described in the "Gigabit Interface Converter" spec by Sun Microsystems, et al. Use the **-f** option to refresh the SFP information. This option is valid only when the **spfShow** command is issued for a specific port.

Use the **-all** operand to display detailed information for all available SFPs. On switches running Fabric OS v7.0.0, this view includes the power on time for the switch in years and hours.

For "smart" SFPs including mini-SFPs, this command displays additional fields, including module temperature, voltage, received optical power, transmitted optical power (long wave only), laser diode drive current, optional status/control register, alarm and warning flags, as well as high and low thresholds programmed on the SFPs.

A "Can not read Serial Data!" message indicates that an SFP ID could not be detected on that location (it could be a fixed port type, or an unsupported SFP type, or an interchassis link without a cable).

NOTES

The **sfpShow** command does not reflect changes in the **sfpShow** output if any SFPs are replaced or removed while a port or a switch is disabled.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specifies the slot number of the port to display, followed by a slash (/)

port

Specifies the number of the port for which to display the SFP information, relative to its slot for bladed systems. Use **switchShow** for a list of valid ports. This operand is optional; if omitted, this command displays a summary of all SFPs on the switch.

-f

Refreshes the SFP information. This option is valid only when **sfpShow** is issued for a specific port.

-all

Displays detailed data for all available SFPs on the switch. This operand is not compatible with slot/port operands.

-health

Displays SFP health status information from Fabric Watch for 10G and 16G SFPs and for 16G QSFPs (Quad Small Form-factor Pluggables). When Fabric Watch monitoring of SFPs is enabled with the thMonitor command, Fabric Watch monitors diagnostic SFP parameters such as current, voltage, receiver power, transmit power, and temperature. When any of these parameters crosses user-configured low and high thresholds the SFP health state changes Possible health states include the following:

Green

SPF operates within Fabric Watch thresholds.

Yellow

At least one SFP parameter monitored by Fabric Watch has crossed a low or high threshold.

No License

The switch does not have a Fabric Watch License

Unknown

This state displays for 8G, 4G and 2G SPF types not supported by this feature.

Paused

Health monitoring is not enabled on the switch.

The detailed view displays the total number of Fabric Watch state transitions for each SFP. To configure the SFP state changes, use the fwFruCfg command. The detailed view also displays the power-on time for 16G SFPs and QSFPs only.

EXAMPLES

To display SFP information including SFP health parameters on a Brocade DCX 8510-8:

```
switch:admin> sfpshow -health

shellFlowControlDisable

Disables XON/XOFF flow control on the console serial port.

SYNOPSIS shellflowcontroldisable

DESCRIPTION Use this command to disable XON/XOFF flow control on the console serial port. Flow control is disabled

by default.

Because this command changes the flow control on the console serial port, it must be executed from a session that is logged in from the console serial port. This command cannot run from a Telnet session.

This setting is saved in the configuration database; therefore, it is persistent across reboots and power

cycles.

NOTES On dual-CP systems, a reboot on the standby CP is required for this command to take effect. No action is

required on the active CP.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To disable flow control:

switch:admin> shellflowcontroldisable

Disabling flowcontrol

flow control is now disabled

SEE ALSO shellFlowControlEnable

shellFlowControlEnable

Enables XON/XOFF flow control on the console serial port.

SYNOPSIS shellflowcontrolenable

DESCRIPTION Use this command to enable XON/XOFF flow control to the shell task. Flow control is disabled by default.

Because this command changes the flow control on the console serial port, it must be executed from a session that is logged in from the console serial port. This command cannot run from a Telnet session.

This setting is saved in the configuration database; therefore, it is persistent across reboots and power

cycles.

NOTES On dual-CP systems, a reboot on the standby CP is required for this command to take effect. No action is

required on the active CP.

If flow control is enabled and if the console output is suspended for an extended period of time, the switch might reboot. It is recommended to disable the flow control, using **shellFlowControlDisable**.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To enable flow control:

switch:admin> shellflowcontrolenable

Enabling flowcontrol

flow control is now enabled

SEE ALSO shellFlowControlDisable

slotPowerOff

Removes power from a slot.

SYNOPSIS slotpoweroff slot

DESCRIPTION Use this command to turn off the power to a blade unit. The slot must have a valid blade unit present and

the blade unit must be of a type that can be powered off.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

slot

Specify the slot number of the blade to be powered down. This operand is

required.

EXAMPLES To power off blade unit 3:

switch:admin> slotpoweroff 3
Slot 3 is being powered off

SEE ALSO powerOffListSet, powerOffListShow, slotPowerOn, slotShow

slotPowerOn

Restores power to a slot.

SYNOPSIS slotpoweron slot

DESCRIPTION Use this command to turn on the power to a blade unit. The slot must have a valid blade unit present and

the blade unit must be currently powered off. The slotShow command reports such slots as being in the

state of INSERTED, NOT POWERED ON.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

slot

Specify the slot number of the blade to be powered on. This operand is required.

EXAMPLES To power on blade unit 3:

switch:admin> slotpoweron 3

Powering on slot 3.

SEE ALSO slotPowerOff, slotShow

slotShow

Displays the status of all slots in the system.

SYNOPSIS slotshow [-m] [-p]

DESCRIPTION

Use this command to display the current status of each slot in the system. Depending on the option used, the command retrieves information on blade type, blade ID, status, Brocade model name, and power usage for each slot in the switch or chassis.

This command does not display the model names for unsupported blades. If a blade is not supported, only the Blade ID is displayed, and the Status field registers as FAULTY(9). Use the list below to identify the model name associated with an unsupported blade.

When no operand is specified, **slotShow** displays the blade type, blade ID, and status for each slot. In this view, the fields and their possible values are as follows:

Slot

Blade Type		Displays the physical slot number.		
		Displays the blade type as one of the following:		
	SW BLADE	The blade is a switch.		
	CP BLADE	The blade is a control processor.		
	CORE BLADE	The blade is a core switch blade.		
	AP BLADE	The blade is an application processor.		
	UNKNOWN			
ID		The blade not present or its type is not recognized.		
טו		Displays the blade type ID as one of the following:		
	16	CP256 control processor blade		
	17	FC4-16 port blade		
	18	FC4-32 port blade		
	24	FR4-18i application processor blade		
	31			
	33	FC4-16IP port blade		
	36	FA4-18 port blade		
	30	FC4-48 port blade		

FC8-16 switch blade

37

	39	FC10-6 switch blade
	43	FS8-18 application processor blade
	46	
	50	CR4S-8 core blade
	51	CP8 control processor blade
		FC8-48 switch blade
	52	Core8 core blade
	55	FC8-32 switch blade
	74	FCoE10-24 application processor blade
	75	FX8-24 application processor blade
	77	
	96	FC8-64 switch blade
	97	FC16-48 switch blade
		FC16-32 switch blade
	98	CR16-8 core blade
	99	CR16-4 core blade
	125	FC8-32E switch blade
	126	FC8-48E switch blade
Stat	us	Displays the status of the blade as one of the following:
	VACANT	
	INSERTED, NOT	The slot is empty. POWERED ON
	POWERING UP	The blade is present in the slot but is turned off.
		The blade is present and powering on.
	LOADING	The blade is present, powered on, and loading the initial configuration.
	DIAG RUNNING	POST1 The blade is present, powered on, and running the POST (power-on self-test).
	DIAG RUNNING	POST2 The blade is present, powered on, and running the reboot power on self tests.

INITIALIZING

The blade is present, powered on, and initializing hardware components.

ENABLED

The blade is on and fully enabled.

DISABLED

The blade is powered on but disabled.

FAULTY

The blade is faulty because an error was detected.

UNKNOWN

The blade is inserted but its state cannot be determined.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

In a DCX-4S, slot 5 is occupied by a control processor blade (Blade ID 50). On a DCX, slot 5 is occupied by the core blade (Blade ID 52).

OPERANDS

This command supports the following operands:

-р

In addition to the basic slot status view, displays the following information about power consumption:

- Total direct current (DC) power consumption for the chassis and individual values for each blade (in Watts). Usage for other components is included but not listed. Note that the data displayed in the "DC Power Consumption" column and in the summary field "Total DC Power consumption" indicate the maximum allowed power consumption, not a real-time value. Real-time power consumption data is displayed for 16G platforms only with the chassisShow command.
- Total alternating current (AC) power consumption in Watts.
- AC efficiency, as a percentage of total and BTU.
- Power efficiency in Watts/port and Watts/Gb.

-m

In addition to the basic slot status view, displays the Brocade model name for each blade.

EXAMPLES

To display the status of all slots on a DCX 8510-8:

switch:user> slotshow				
Slot	Blade Type	ID	Status	
1	SW BLADE	97	ENABLED	
2	SW BLADE	96	ENABLED	
3	SW BLADE	97	ENABLED	
4	SW BLADE	96	ENABLED	
5	CORE BLADE	98	ENABLED	
6	CP BLADE	50	ENABLED	
7	CP BLADE	50	ENABLED	
8	CORE BLADE	98	ENABLED	
9	SW BLADE	125	ENABLED	
10	SW BLADE	126	ENABLED	
11	SW BLADE	37	ENABLED	
12	SW BLADE	55	ENABLED	

To display the Brocade model name for each blade on a Brocade DCX 8510-8:

switch:user> slotshow -m

Slot	Blade	Type	ID	Status
1	SW BLADE	97	FC16-32	ENABLED
2	SW BLADE	96	FC16-48	ENABLED
3	SW BLADE	97	FC16-32	ENABLED
4	SW BLADE	96	FC16-48	ENABLED
5	CORE BLADE	98	CR16-8	ENABLED
6	CP BLADE	50	CP8	ENABLED
7	CP BLADE	50	CP8	ENABLED
8	CORE BLADE	98	CR16-8	ENABLED
9	SW BLADE	125	FC8-32E	ENABLED
10	SW BLADE	126	FC8-48E	ENABLED
11	SW BLADE	37	FC8-16	ENABLED
12	SW BLADE	55	FC8-32	ENABLED

To display power consumption information on a Brocade DCX 8510-8:

switch:user> slotshow -p

Slot	Blade Type	ID	DC Power Consumption	Status
1	UNKNOWN			VACANT
2	AP BLADE	43	235	ENABLED
3	UNKNOWN			VACANT
4	SW BLADE	97	125	ENABLED
5	CORE BLADE	98	260	ENABLED
6	CP BLADE	50	40	ENABLED
7	CP BLADE	50	40	ENABLED
8	CORE BLADE	98	260	ENABLED
9	AP BLADE	75	250	ENABLED
10	SW BLADE	97	125	ENABLED
11	SW BLADE	77	130	ENABLED
12	SW BLADE	96	180	ENABLED
Total	DC Power Consu	umption	ı:	
2195	watts			

Total AC Power Consumption:

2438 watts AC @ 90% efficiency (8321 BTU)

Power Efficiency:

0.85 watts per port, 0.12 watts per Gb

To display the Brocade model name for each blade on a Brocade DCX 8510-4:

switch:user> slotshow -m

Slot	Blade Type	ID	Model Name	Status
1	UNKNOWN			VACANT
2	SW BLADE	96	FC16-48	ENABLED
3	CORE BLADE	99	CR16-4	ENABLED
4	CP BLADE	50	CP8	ENABLED
5	CP BLADE	50	CP8	ENABLED
6	CORE BLADE	99	CR16-4	ENABLED
7	UNKNOWN			VACANT
8	UNKNOWN			VACANT

To display power consumption information on a Brocade DCX 8510-4:

switch:user> slotshow -p				
Slot	Blade Type	ID	DC Power	Status
			Consumption	
1	UNKNOWN		-	VACANT
2	SW BLADE	96	180	ENABLED
3	CORE BLADE	99	200	ENABLED
4	CP BLADE	50	40	ENABLED
5	CP BLADE	50	40	ENABLED
6	CORE BLADE	99	200	ENABLED
7	UNKNOWN		-	VACANT
8	AP BLADE	43	235	ENABLED
Total	DC Power Consu	umption	n:	
1149	watts			
Total	AC Power Consu	umption	n:	
1276	watts AC @ 90%	effi	ciency (4355 BT	U)
Power	Efficiency:			

To display power consumption information on a DCX-4S:

3.32 watts per port, 0.83 watts per Gb

switch:user> slotshow -p

Slot	Blade Type	ID	DC Power Consumption	Status
1	SW BLADE	77	130	ENABLED
2	SW BLADE	51	115	ENABLED
3	CORE BLADE	46	60	ENABLED
4	CP BLADE	50	40	ENABLED
5	CP BLADE	50	40	ENABLED
6	CORE BLADE	46	60	ENABLED
7	AP BLADE	74	250	ENABLED
8	AP BLADE	74	250	ENABLED
Total	DC Power Consu	umption	n:	

1199 watts

Total AC Power Consumption:

1332 watts AC @ 90% efficiency (4546 BTU)

Power Efficiency:

1.04 watts per port, 0.26 watts per Gb

snmpConfig

Manages the SNMP agent configuration.

SYNOPSIS

snmpConfig --show | --set | --default | --enable | --disable [snmpv1 | snmpv3 | | mibCapability | systemGroup | seclevel]

snmpConfig --set mibCapability [-mib_name mib_name [-bitmask bit_mask]]

snmpConfig --enable | --disable mibCapability -mib name mib name [-trap name trap name]

snmpConfig --enable | --disable snmpv1

snmpConfig --help

DESCRIPTION

Use this command to manage the configuration of the SNMP agent in the switch. The configuration includes SNMPv1 and SNMPv3 configuration, access control list (ACL), MIB capability, system group, and security level settings. The command supports set, reset to default, and display operations.

The SNMP Agent configuration interface is interactive for all parameters except mibCapability, which can be configured both interactively and with command line options on platforms running Fabric OS v6.4.0 and later. The enhanced command line interface supports enabling or disabling a single MIB or all MIBs, configuring a single trap only, and managing traps in excess of 32.

The SNMPv3 configuration supports sending inform requests as an alternative to trap requests. Traps are unreliable because the receiver does not send any acknowledgment when it receives a trap. The sender cannot determine if the trap was received. However, an SNMP manager that receives an inform request acknowledges the message with an SNMP response protocol data unit (PDU). If the manager does not receive an inform request, it does not send a response. If the sender never receives a response, the inform request can be sent again. For this reason, informs are more likely to reach their intended destination.

All values successfully changed by this command take effect immediately and are persistent across power cycles and reboots.

In Fabric OS v7.0.0 and later, you can use this command to block or unblock access to SNMPv1/v2c. If SNMPv1/v2c access is blocked, all requests for v1/v2c version will be dropped by the switch, and SNMPv1 traps will be blocked from being sent, even if trap destinations are present. Enforcement of this feature takes precedence over other SNMP security related features, such as accessControl or seclevel.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Informs are not supported for IPv6 addresses.

OPERANDS

This command has the following operands:

--help

Displays the command usage.

--show

Displays the SNMP agent configuration data of the specified category. When used with the snmpv1 operand, this command displays whether access to SNMPv1/v2c is enabled or disabled.

--set

Sets the SNMP agent configuration data of the specified category. This operand displays the current settings and then prompts you to change the values for each parameter.

--default

Sets the SNMP agent configuration data for a specified item to the default values. Generally, these default values may be available in the configuration database. The command sets to factory defaults if the SNMP agent configuration parameters are not available in the configuration database.

--enable

Enables the SNMP agent configuration for the specified category. This operand is valid only with **mibCapability** and **snmpv1**. When used with the **snmpv1** operand, this command restores access to SNMPv1/v2c.

--disable

Disables the SNMP agent configuration for the specified category. This operand is valid only with **mibCapability** and **snmpv1**. When used with the **snmpv1** operand, this command blocks access to SNMPv1/v2c. All requests for v1/v2c version will be dropped by the switch, and SNMPv1 traps will be blocked from being sent, even if trap destinations are present.

snmpv1

Selects SNMPv1-related configuration parameters. These parameters include the community string, trap recipient IP address, and trap severity level associated with each trap recipient IP address. When "0" is configured as a trap port, traps can be received at the default port 162.

snmpv3

Selects SNMPv3-related configuration parameters. These parameters include the user name, authentication protocol and password, the privacy protocol and password, the SNMPv3 trap recipient's IP address, its associated user index and trap severity level. When "0" is configured as a trap port, traps can be received at the default port 162.

The **--set snmpv3** command supports an interactive option to enable or disable informs by setting the parameter "SNMP Informs Enabled" to true or false. If informs are enabled, all trap destinations receive inform requests. If informs are disabled, all trap destinations receive trap requests. When informs are enabled, the engine ID must be set to correspond to the management engine IP address (see example). Informs are by default disabled. IPv6 Informs are currently not supported.

accessControl

Selects access-control-related parameters. These parameters include the access host subnet area and access permission (read-write).

mibCapability

Selects configuration parameters related to the SNMP agent's MIBs and trap capability parameters. These parameters include MIBs and traps supported by the SNMP agent.

systemGroup

Selects configuration parameters related to the system group. These parameters include sysDescr, sysLocation, sysContact, and authentication failure trap.

secLevel

Sets the SNMP security level.

SNMPv1 Configuration Parameters

The agent supports six communities and their associated trap recipients and trap recipient severity levels. The first three communities are for read-write (rw) access and the last three are for read-only (ro) access. The default value for the trap recipient of each community is 0.0.0.0. The length of the community string should be in the range of 2 to 16 characters. The default values for the community strings include the following:

- Community 1: Secret Code
- Community 2: OrigEquipMfr
- Community 3: private
- Community 4: public
- Community 5: common
- Community 6: FibreChannel

When an FCS policy is enabled, community strings can be changed on the primary FCS switch only, and only the primary FCS switch propagates changes across the fabric.

For an SNMP management station to receive a trap generated by the agent, the administrator must configure a trap recipient to correspond to the IP address of the management station. In addition, the trap recipient must be able to pass the access control list (ACL) check as described in the Access Control category.

Trap Recipient Severity Level

When an event occurs and its severity level is at or below the set value, the Event Trap traps (swEventTrap, connUnitEventTrap and swFabricWatchTrap), are sent to configured trap recipients. By default, this value is set at 0, implying that no Event Trap is sent. Possible values are

- 0 None
- 1 Critical
- 2 Error
- 3 Warning
- 4 Informational
- 5 Debug

SNMPv3 Configuration Parameters

Two user roles, **snmpadmin** and **snmpuser** are supported. The **snmpadmin** role provides read-write access and the **snmpuser** role provides read-only access. Entries are added to the USM table corresponding to each role. A total of three entries for **snmpadmin** and **snmpuser** respectively are supported. Separate default passwords are provided for creation of **authKey** and **privKey** for each entry. The default set of passwords is published and the default algorithm (MD5/SHA) is used to create the initial set of authentication keys. You can change these passwords using this option. You can select the authentication protocol MD5/SHA or no authentication for each entry.

The following combinations of protocols are supported:

- NoAuth/NoPriv
- Auth/NoPriv
- Auth/Priv

The user name must be between 2 and 32 characters long. The default user names are defined with the **noAuth** and **noPriv** protocol. The factory default SNMPv3 user names include the following:

- User 1: snmpadmin1
- User 2: snmpadmin2
- User 3: snmpadmin3
- User 4: snmpuser1

- User 5: snmpuser2
- User 6: snmpuser3

The --default option sets the user name and password to default.

If an FCS policy is enabled, the configuration must be updated on the primary switch and the nonprimary switches; unlike community strings, user names and passwords are not distributed for other switches in the fabric.

When new passwords are entered for any user entry, a new **authKey** and **privKey** are generated. The new passwords must be updated on the client (e.g., MIB browser) as well. **AuthKey** and **privKey** can also be updated with the delta key mechanism provided by the SNMPv3 protocol.

The system prompts for password confirmation if a protocol other than **NoAuth/NoPriv** is selected. Protocol passwords must be between 1 and 20 characters.

In order for an SNMP management station to receive SNMPv3 traps generated by the agent, the administrator must configure a trap recipient value to correspond to the IP address of the management station. In addition, the trap recipient must pass the ACL check as described in the Access Control section. The trap recipient must be associated with one of the six users of SNMPv3 and trap severity level. The factory default value for the SNMPv3 trap recipient of each user is 0.0.0.0.

Access Control Configuration Parameters

The ACL check is as follows: there are six ACLs to restrict SNMP get, set, and trap operations to hosts under an host-subnet-area. The host-subnet-area is defined by comparing nonzero IP octets. For example, an ACL of 192.168.64.0 enables access by any hosts that start with the specified octets. The connecting host is enabled to set each host-subnet-area to be read-write or read-only. The closest match out of six entries is given access. The ACL check is turned off when all six entries contain 0.0.0.0. The default values of all six entries are 0.0.0.0. For IPv6 subnets, the format is specified by an IPv6 address followed by the number of fixed bits in the address.

MIB Capability Configuration Parameters

The **mibCapability** option turns certain MIBS and associated SNMP traps on or off. If a specific MIB is disabled, the corresponding traps also are disabled. If any trap group is disabled, the corresponding individual traps are also disabled.

In Fabric OS v6.4.0 and later, SNMP Traps are identified by their bit mask and can be read directly from the switch configuration. The MIB and trap status (enabled or disabled) status is recorded in a 64- bit counter. The last bit (bit 0) is reserved for the MIB and the remaining bits are reserved for the traps of that MIB. The trap's position is allocated based on the last ID of the trap OID. For example, the last ID of the swEventTrap is 5 so its position will be 5th from the right. The following is a listing of valid SNMP traps and their bit masks:

MIB	Trap Name and position	Bit mask	Default
FE-MI	В	0x1	Enabled
SW-MI	В	0x1	Enabled
	swFault (1)	0x2	Enabled
	swSensorScn (2)	0x4	Enabled
	swFCPortScn (3)	0x8	Enabled
	<pre>swEventTrap (4)</pre>	0x10	Enabled
	swFabricWatchTrap (5)	0x20	Enabled
	<pre>swTrackChangeTraps(6)</pre>	0x40	Enabled
	swIPv6ChangeTrap (7)	0x80	Enabled
	<pre>swPmgrEventTrap (8)</pre>	0x100	Enabled
	<pre>swFabricSegmentTrap (9)</pre>	0x200	Disabled
	swFabricReconfigTrap (10)	0x400	Disabled
	swExtTrap (11)	0x800	Disabled
	swStateChange (12)		Disabled
	swMovePort (13)		Disabled
	swBrcdGenericTrap (15)		Disabled

FA-MIB		0x1	Enabled
connUnitStat	0x2	Enabled	
connUnitAdde	N/A	Enabled	
connUnitDele	8x0	Enabled	
connUnitEven	0x10	Enabled	
connUnitSens	orStatusChange(5)	0x20	Enabled
connUnitPort	StatusChange (6)	0x40	Enabled
FICON-MIB		0x1	Enabled
linkRNIDDevi	ceRegistration (1)	0x2	Enabled
linkRNIDDevi	cedeRegistration(2)	0x4	Enabled
linkLIRRList	enerAdded (3)	0x8	Enabled
linkLIRRList	enerRemoved (4)	0x10	Enabled
linkRLIRFail	ureIncident (5)	0x20	Enabled
HA-MIB		0x1	Enabled
fruStatusCha	nged (1)	0x2	Enabled
cpStatusChan	ged (2)	0x4	Enabled
fruHistoryTr	ap (3)	0x8	Enabled
FCIP-MIB		0x1	Enabled
SCSI-MIB		0x1	Enabled
iscsiTgtLog	inFailure (1)	0x2	Enabled
iscsiTgtLog	inFailure (2)	0x4	Enabled
iscsiTgtLog	inFailure (3)	0x8	Enabled
IF-MIB		0x1	Enabled
linkUpTrap	(3)	0x8	Enabled
linkdownTra	p (4)	0x10	Enabled
BBD-MIB		0x1	Enabled
bdTrap (1)		0x2	Enabled
bdClearTrap	(2)	0x4	Enabled

Use the **--show mibCapability** option to display the traps configurable under each MIB. For more information, refer to the *Fabric OS MIB Reference*.

The following MIB configuration options are supported:

--set mibCapability

Configures MIBs interactively. When used without a MIB name, this command displays a menu with supported MIBs and associated traps, and for each MIB or trap, you are prompted to confirm or change the default by specifying yes or no. Specifying yes means you can access the MIB variables with an SNMP manager.

For two traps under the SW-TRAP category, the swEventTrap and the swFabricWatchTrap, this command provides the option to specify a severity levels to control the number of generated alerts. When a severity level is configured, traps below the specified severity level specified are not sent. Refer to the Examples section for an illustration. Specify one of the following values:

^	·
0	None (default)
1	Critical
2	Error

3

Warning

4

Informational

-mib_name mib_name

Specifies the name of the MIB to be configured. This operand is required if you want to configure MIB traps noninteractively. Valid MIB names include the following.

- FE-MIB
- SW-MIB
- FA-MIB
- FICON-MIB
- HA-MIB
- FCIP-MIB
- ISCSI-MIB
- IF-MIB
- BD-MIB

-bitmask bit_mask

Specifies the bit mask for the MIB. Refer to the table above for valid values.

--enable mibCapability -mib_name mib_name

Enables the specified MIB noninteractively.

--disable mibCapability -mib_name mib_name

Disables the specified MIB noninteractively. When used with the trap name operand, only the specified trap is disabled.

-trap_name trap_name

Specifies the name of the trap to be enabled or disable. This operand is optional. Use **snmpConfig --show mibCapability** for a listing of valid traps.

System Group Configuration Parameters

sysDescr

The system description. The default value is Fibre Channel switch.

sysLocation

The location of the system (switch). The default value is End User Premise. The string must be at least 4 characters in length; the maximum length is 255 characters.

sysContact

The contact information for this system (switch). The default value is Field Support. Refer to the definition of sysDescr, sysLocation and sysContact in the system group of MIB-II. The string must be at least 4 characters in length; the maximum length is 255 characters.

authTraps

When enabled, the authentication trap (authenticationFailure) is transmitted to a configured trap recipient in the event that the agent receives a protocol message that is not properly authenticated. In the context of SNMPv1 and SNMPv2c, this means that a request contains a community string that is not known to the agent. The default value for this parameter is 0 (disabled).

Security Level Parameters

The **--show** option displays the current SNMP GET security and SNMP SET security levels. Use **--set** secLevel to modify existing settings:

```
SNMP GET security level
                      Specifies security level for all SNMP GET requests.
SNMP SET security level
                      Specifies security level for SNMP SET requests only. Values include the following:
    0
                      No security.
    1
                      Authentication only.
    2
                      Authentication and Privacy.
    3
                      OFF
```

EXAMPLES To display the SNMPv1 configuration:

```
switch:admin> snmpConfig --show snmpv1
SNMPv1 community and trap recipient configuration:
 Community 1: Secret COde (rw)
   Trap recipient: 10.32.147.113
   Trap recipient Severity Level: 0
 Community 2: OrigEquipMfr (rw)
   Trap recipient: 1080::8:800:200C:1234
   Trap recipient Severity Level: 0
 Community 3: private (rw)
   No trap recipient configured yet
 Community 4: public (ro)
   No trap recipient configured yet
 Community 5: common (ro)
   No trap recipient configured yet
 Community 6: FibreChannel (ro)
   No trap recipient configured yet
```

To set the SNMPv1 configuration of a switch:

```
switch:admin> snmpConfig --set snmpv1
SNMP community and trap recipient configuration:
Community (rw): [Secret COde]
Trap Recipient's IP address: [0.0.0.0] \
  1080::8:800:200C:1234
Community (rw): [OrigEquipMfr]
string size must be between 2 and 16 - please re-enter
Community (rw): [OrigEquipMfr]
Trap Recipient's IP address: [1080::8:800:200C:1230] \
   10.32.147.113
Community (rw): [private]
Trap Recipient's IP address: [0.0.0.0]
Community (ro): [public]
Trap Recipient's IP address: [0.0.0.0]
Community (ro): [common]
Trap Recipient's IP address: [0.0.0.0]
Community (ro): [FibreChannel]
Trap Recipient's IP address: [0.0.0.0]
```

To set the access control configuration:

```
switch:admin> snmpconfig --set accessControl
SNMP access list configuration:
Access host subnet area in dot notation: [0.0.0.0] 192.168.0.0
Read/Write? (true, t, false, f): [true]
Access host subnet area in dot notation: [0.0.0.0] 10.32.148.0
Read/Write? (true, t, false, f): [true] f
Access host subnet area in dot notation: [0.0.0.0]
Read/Write? (true, t, false, f): [true]
Access host subnet area in dot notation: [0.0.0.0] 10.33.0.0
Read/Write? (true, t, false, f): [true] f
Access host subnet area in dot notation: [0.0.0.0]
Read/Write? (true, t, false, f): [true]
Access host subnet area in dot notation: [0.0.0.0]
Read/Write? (true, t, false, f): [true]
Committing configuration...done.
```

To set the severity level for switch events and Fabric Watch alerts:

```
switch:admin> snmpconfig --set mibCapability
The SNMP Mib/Trap Capability has been set to support
SW-TRAP (yes, y, no, n): [yes]
  swFCPortScn (yes, y, no, n): [yes]
  swEventTrap (yes, y, no, n): [yes]
  Desired Serverity Level (1- critical 2- error 3 \
    -warning 4- informational 0 -None): 4
swFabricWatchTrap (yes, y, no, n): [yes]
  Desired Serverity Level (1- critical 2- error 3 \
    -warning 4- informational 0 -None): 2
[...]
```

To enable the swFabricWatchTrap noninteractively:

```
switch:admin> snmpconfig --enable mibCapability \
    -mib_name SW-MIB -trap_name swFabricWatchTrap
Operation succeeded
```

To enable the **swEventTrap** of the SW-MIB category only (this operation disables all other SNMP traps in this MIB category):

```
swPmgrEventTrap: NO
            swFabricReconfigTrap: NO
            swFabricSegmentTrap: NO
            swExtTrap: NO
   [...]
To enable the SW-MIB MIB only without changing the current trap configuration:
   switch:admin> snmpconfig --enable mibCapability \
         -mib_name SW-MIB
   Operation succeeded
   switch:admin> snmpconfig --show mibCapability
   SW-TRAP: YES
            swFault: NO
            swSensorScn: NO
            swFCPortScn: NO
            swEventTrap: YES
                    DesiredSeverity:4
            swFabricWatchTrap: NO
                    DesiredSeverity:2
            swTrackChangesTrap: NO
            swIPv6ChangeTrap: NO
            swPmgrEventTrap: NO
            swFabricReconfigTrap: NO
            swFabricSegmentTrap: NO
            swExtTrap: NO
            swStateChangeTrap: NO
            swPortMoveTrap: NO
            swBrcdGenericTrap: NO
   [...]
To re-enable all traps under the SW-MIB category:
   switch:admin> snmpconfig --set mibCapability \
         -mib name SW-MIB -bitmask 0xFFF
   Operation succeeded
   switch:admin> snmpconfig --show mibCapability
   [...]
   SW-TRAP: YES
            swFault: YES
            swSensorScn: YES
            swFCPortScn: YES
            swEventTrap: YES
                    DesiredSeverity:None
            swFabricWatchTrap: YES
                    DesiredSeverity:None
            swTrackChangesTrap: YES
            swIPv6ChangeTrap: YES
            swPmgrEventTrap: YES
            swFabricReconfigTrap: Yes
            swFabricSegmentTrap: Yes
            swExtTrap: Yes
            swStateChangeTrap: NO
            swPortMoveTrap: NO
            swBrcdGenericTrap: NO
   [...]
```

To display the configuration for all MIBs and associated traps:

```
switch:admin> snmpconfig --show mibCapability
FE-MIB: YES
SW-MIB: YES
FA-MIB: YES
FICON-MIB: YES
HA-MIB: YES
FCIP-MIB: YES
ISCSI-MIB: YES
IF-MIB: YES
BD-MIB: YES
SW-TRAP: NO

To restore the systemGroup configuration to default values:

Select SNMP SET Security Level

(0 = No security, 1 = Authentication only,

```
switch:admin> snmpconfig --default systemGroup
   This command will reset the agent's system group
   configuration back to factory default
             sysDescr = Fibre Channel Switch
          sysLocation = End User Premise
           sysContact = Field Support
            authTraps = 0 (OFF)
   Are you sure? (yes, y, no, n): [no] y
To set the security level:
   switch:admin> snmpconfig --set seclevel
   Select SNMP Security Level
   (0 = No security, 1 = Authentication only,
   2 = Authentication and Privacy, 3 = No Access): (0..3) [0] 1
```

2 = Authentication and Privacy, 3 = No Access): (1..3) [1]

To display the SNMP3 configuration with informs disabled (in the example, the Engine ID in the user1 entry corresponds to the engine ID of the trap manager in Trap Entry 2: 10.103.5.105):

```
switch:admin> snmpconfig --show snmpv3
SNMP Informs = 1 (ON)
SNMPv3 USM configuration:
User 1 (rw): snmpadmin1
       Auth Protocol: noAuth
       Priv Protocol: noPriv
       Engine ID: 00:00:00:00:00:00:00:00
User 2 (rw): snmpadmin2
       Auth Protocol: noAuth
       Priv Protocol: noPriv
       Engine ID: 80:00:05:23:01:0a:23:34:22
User 3 (rw): snmpadmin3
       Auth Protocol: noAuth
       Priv Protocol: noPriv
       Engine ID: 00:00:00:00:00:00:00:00
User 4 (ro): snmpuser1
       Auth Protocol: noAuth
       Priv Protocol: noPriv
       Engine ID: 00:00:00:00:00:00:00:00
User 5 (ro): snmpuser2
       Auth Protocol: noAuth
       Priv Protocol: noPriv
       Engine ID: 00:00:00:00:00:00:00:00
User 6 (ro): snmpuser3
       Auth Protocol: noAuth
       Priv Protocol: noPriv
       Engine ID: 00:00:00:00:00:00:00:00
SNMPv3 Trap configuration:
                No trap recipient configured yet
Trap Entry 1:

snmpTraps

Sends or displays SNMP traps.

SYNOPSIS

snmptraps --send [-trap_name trap_name]

[-ip address in address]

snmptraps --show [port]

snmptraps --block -port [slot|port | ALL

snmptraps --unblock -port [s/of|port | ALL

snmptraps --help

DESCRIPTION

Use this command to manage specific Simple Network Management Protocol (SNMP) traps.

Use the **--send** option to send a specific SNMP trap to a recipient indicated by its IP address. Or use the **--send** option without operands to send all supported traps to all configured SNMP trap recipients. When the command is issued to send all traps, the message returned indicates only the total number of traps sent and not the individual trap names.

In Fabric OS v7.0.0 and later you can block or unblock certain port traps on specified ports. This feature provides control over a subset of port traps including the following: SwFCPortScn, ConnUnitPortStatusChange, and SwFabricSegmentTrap.

Use the **--show** option with the **port** operand to display the status of blocked ports. When used without operands, the **--show** option displays all Management Information Base (MIB) objects and associated traps that are supported in Fabric OS.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--send

Sends one or all SNMP traps to all configured recipients or to a specified recipient. The following operands are optional:

-trap_name trap_name

Specifies the trap by name. Use **snmptraps** --show for a listing of valid traps.

-ip_address ip_address

Specifies the recipient by its IP address in IPv4 or IPv6 format. IPv6 addresses require Fabric OS v6.4.0 or later.

--block [slot|port | ALL

Blocks the following port traps on the specified port: SwFCPortScn, ConnUnitPortStatusChange, and SwFabricSegmentTrap. When used with the **ALL** this command blocks these traps on all ports.

--unblock [slot|port | ALL

Removes the trap blocking from the specified port or from all ports.

--show [port]

Displays all configured SNMP traps and MIBs. When used with the optional **port** argument, this command displays the ports that are blocked from receiving certain software traps.

--help

Displays the command usage.

EXAMPLES

To send all traps to the configured recipients:

```
switch:admin> snmpTraps --send
Number of traps sent : 27
```

To send a bottleneck detection trap to recipient 172.16.0.12

```
switch:admin> snmptraps --send -trap_name \
   bd-trap-ip_address 172.16.0.12.
Number of traps sent : 1
```

To display the traps and MIBs supported in Fabric OS:

```
switch:admin> snmpTraps --show
```

#	Mib Name	Supported Traps
001	 SW-MIB	
		sw-fabric-watch-trap
		sw-fc-port-scn
		ip-v6-change-trap
		sw-pmgr-event-trap
		sw-event-trap
		sw-fabric-reconfig-trap

		fru-history-trap
		cp-status-change-trap
006	BD-MIB	bd-trap
		bd-clear-trap

To block a single port from receiving traps:

```
switch:admin> snmpTraps --block 17
```

To unblock a previously blocked port:

```
switch:admin> snmpTraps --unblock 17
```

To configure the switch so that only two ports receive the port traps, you block all traps and then unblock the ports you want to receive the traps:

```
switch:admin> snmpTraps --block ALL
switch:admin> snmpTraps --unblock 17
switch:admin> snmpTraps --unblock 18
```

To display the blocked port status:

switch:a	.dmin>	snmpTr	aps	show p	ort

Blocked				[

SEE ALSO snmpConfig

spinFab

Runs functional test of interswitch link (ISL) cabling and trunk group operation.

SYNOPSIS

spinfab

[-nmeas count] [-framesize bytes] [-ports itemlist] [-setfail mode] [-fports flag]

DESCRIPTION

Use this command to verify the intended functional operation of interswitch links (ISLs) at the maximum speed by setting up the routing hardware so that test frames received by each E Port are retransmitted on the same E_Port. Several frames are subsequently sent to the neighbor port attached to each active E_Port specified. Because the default action for such frames is to route them back to the sender, which never occurs during normal traffic, the frames circulate until the test terminates.

The frames are continuously transmitted and received in all ports in parallel. The port LEDs flicker green rapidly while the test is running.

M->N/M->M loopback ports are tested as well, using the same algorithm, if loopback cables or loopback plugs are present in the switch.

While the frames are circulating, the RX frame count and port CRC and encoder error statistics are monitored. If a port stops or a low-level error occurs, the test generates an error message. Every one million frames, the circulating frames are captured to verify that they are still circulating and in the appropriate order. In this manner, the test can verify the entire path to the remote switch as well as the proper in-order delivery operation of any trunk groups present.

The switch remains in normal operation while this test is running. However, some performance degradation may occur due to the ISLs being saturated with test frames. For this reason, use caution when running this test on live fabrics. Consider testing only one trunk group or ISL at a time, and do not run the tests for extended periods of time.

Combine this test with portLoopBackTest for ISL link failure isolation. If spinFab fails, replace the cable with a loopback plug and run portLoopBackTest to verify the local switch and media. If these pass, the fault lies in the cable, the remote switch, or media.

The frame size depends on the amount of buffer credit available on the port. There are eight possible frames that can be sent. Especially with trunking groups, all eight possible frames are used unless there is extensive traffic running on the link. The payload sizes of those eight frames are 1024, 12, 8,1024, 512, 1024, 12, and 1024.

NOTES

On switches running Fabric OS v6.4.0 and later, you can use **spinFab** to test ports that previously caused nonspecific test results or were skipped by spinFab. The following port types support the spinFab diagnostics.

- Loopback ports
- E_Ports
- Trunk master ports
- Ports with index numbers greater than 255.
- Ports with swapped areas.
- Ports in logical switches.
- Ports in Base Switches.
- Trunk Slave ports.

- Long Distance ports.
- F Ports connected to an HBA.

The following ports do not support the **spinFab** test:

- Interchassis links (ICL) ports
- F Ports connected to an Access Gateway
- EX Ports
- E_Ports connected to EX_Ports
- If Access Gateway mode is enabled, spinFab tests only the F_Ports connected to Brocade-branded HBAs and skips all other ports (F_Ports connected to non-Brocade branded HBAs and N_Ports).

p>On switches running Fabric OS v7.0.0 and later, you can use **spinFab** on D_Ports to identify problems with interswitch links. The D_Port functionality is applicable to 16G port SFPs only. On the D_Port, **spinFab** runs as an offline diagnostics.

When trunk groups are present, the entire trunk group must be included in the range of ports to test or false failure notifications may occur. If multiple ISL links are present between two switches that support trunking, then it is likely that trunk groups are present and all ports between the two switches should be tested at the same time.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-nmegs count

Specifies the number of frames to send in millions. The test progresses until the specified number of frames has been transmitted on each port. The default value is 10 million frames. This command only approximately counts the frames and the actual number of frames sent will be slightly larger, particularly at link speeds of 4 Gbps or higher.

-framesize bytes

For internal use only. Not supported.

-ports itemlist

Specifies a list of user ports to test. By default, all of the ISL ports in the current switch are tested. Refer to **itemList** for further details.

-setfail mode

Instructs **spinFab** how to mark failed ports. Valid values include the following:

0

Does not mark failing ports as FAILED (default). This option minimizes the impact on live fabrics.

1

Marks the failing ports as FAILED. In test or qualification environments without live traffic, this may be useful with large values of **-nmegs** *count*. This mode is disabled by default.

-fports flag

Instructs spinFab to include or exclude F_Ports in the testing. This feature is disabled by default. If enabled, spinFab tests the F_Ports connected to Brocade-branded HBAs along with other valid ports (E-ports & Loopback ports) . The HBA must be running firmware v2.1.1or higher. Valid flag values include the following:

0

Does not include F_Ports in the port list for testing (default).

1

Includes F_Ports in the port list for testing.

DIAGNOSTICS

When it detects failures, the test may report one or more of the following error messages. If errors persist, contact Technical Support.

```
DATA
ERR_STAT

sshUtil

Manages public key authentication.

SYNOPSIS

sshutil allowuser user name

sshutil showuser

sshutil importpubkey

sshutil showpubkeys

sshutil delpubkeys

sshutil genkey

sshutil exportpubkey

sshutil delprivkey

sshutil help

DESCRIPTION

Use this command to enable and manage SSH public key authentication on a switch. SSH public key authentication provides a mechanism for authenticating an authorized user without a password. SSH public key authentication is more secure than password authentication and can be used to securely access services that require automatic login.

SSH public key authentication works as follows: An authorized user generates a pair of encryption keys (public and private) on a local machine (a switch or a server). Messages encrypted with the private key can only be decrypted by the public key, and vice versa. The private key remains on the local machine; the public key is exported to a remote host. The remote host responds to login requests by sending a brief message encrypted with the public key. The private key on the local host decrypts the message, and the login succeeds.

Use the **sshUtil** command to do the following:

- Configure a user to perform public key authentication and to manage keys on a switch.
- Generate a private/public key pair on the local switch.
- Import a public key for a specified user from a remote host to the local switch.
- Export the public key from the local switch to a remote host.
- Delete the public keys associated with a specified user or all users on the local switch.
- Delete the private key on the local switch.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Outgoing public key authentication from the switch to a remote host is restricted to Fabric OS Commands which use secure copy (SCP), such as **configDownload** or **configUpload**.

This command supports generation of a public/private key pair on the switch to enable outgoing connections between a switch and a remote host. To set up incoming connections, you must first generate the public/private key pair on a remote host and then import the public key to the switch. Use the SSH utility **ssh-keygen-t dsa** to generate the keys on the remote host. Refer to your UNIX system documentation for details on this command.

OPERANDS

This command supports the following operands:

allowuser user name

Configures the specified user to perform public key authentication and all related management operations for outgoing public key authentication. This operation can only be performed by the default admin. The default admin is, by default, a configured user. Only one user can be configured at any given time.

The following operand is required:

user name

Specifies login name for the configured user. The user must be in the switch user database and must have admin privileges on the switch.

showuser

Displays the currently configured user. This operation can only be performed by the default admin.

importpubkey

Imports a public key from a remote host to the local switch. The protocol used is SCP. This operation supports authentication for incoming connections. For this operation to succeed, a public/private key pair must be generated on the remote host prior to the import by issuing ssh-genkey -t dsa (a UNIX command). The command prompts for a user name for whom the public key is imported. Once the public key is imported successfully, the user for whom the key was imported can perform public key authentication with the switch from the remote host, on which the private key resides.

importpubkey prompts for the following input parameters:

Username

Enter the user name for whom the key is imported.

IP Address

Enter the IP address for the remote host. IPv4 and IPv6 addresses are supported.

remote directory

Enter the path where the public key is stored on the remote host. The default directory where SSH stores public keys is ~username/.ssh.

public key name

Enter the name of the file in which the public key is stored on the remote host. This is a user-generated file name that must have a .pub extension.

login name

Enter the user login name for the remote host.

password

Enter the password for the remote user.

showpubkeys

Displays all imported public keys associated with the specified user. Public keys generated on the switch are not shown. This command interactively prompts for a username.

username

Enter the username for whom you want to display the public keys.

delpubkey

Deletes all imported public keys associated with a specified user on the switch or with all users. This command prompts for the user name associated with the public keys. Enter "all" to delete the public keys of all users. Deletion of a configured user's public keys effectively blocks incoming connections from this user that rely on public key authentication with the switch.

genkey

Generates an RSA private/public key pair on the local switch. This option can be performed only by a configured user. This option enables authentication for outgoing connections from the switch to a remote host. You must export the public key to a remote host to complete the setup. For incoming connections, the private/public key must first be generated on the remote host by issuing **ssh-genkey -t dsa** (a UNIX command), and then importing the public key from the remote host to the switch using the **sshutil import** command.

genkey prompts for user input on the following parameters:

passphrase

Accepts a string of arbitrary length. This operand is optional, but creating a pass phrase is strongly recommended. A strong pass phrase is 10-30 characters long, fairly complex and difficult to guess. and contains a mix of upper and lowercase letters, numbers, and nonalphanumeric characters. There is no way to recover a lost pass phrase. If the pass phrase is lost, a new key must be generated and copied to the corresponding public key to other machines.

exportpubkey

Exports the public key from the switch to a specified remote host to support outgoing connections from the switch to a remote host. This option can only be performed by a configured user. The successfully exported public key must be appended to the authorized_keys file on the remote host. Use the **cat** ~/.ssh/outgoing.pub >> ~/.ssh/authorized_keys command to append the file.

exportpubkey prompts for IP Address, remote directory, login name and password. Refer to **importpubkey** for a description of these parameters.

delprivkey

Deletes the private key for outgoing connection from the switch. This option can only be performed by a configured user. Deletion of a configured user's private keys effectively blocks outgoing connections initiated by this user that rely on public key authentication with a remote host.

help

Displays the command usage.

EXAMPLES

To configure a user for public key authentication:

```
switch:admin> sshutil allowuser username
Allowed user has been successfully changed to username.
```

To display the configured user:

```
switch:admine> sshutil showuser
    username
```

To set up SSH public key authentication on a switch for incoming connections:

1. Generate a private/public key pair on a remote host (accept default directory and file name):

```
username@remotehost> ssh-keygen -t dsa

Generating public/private dsa key pair.

Enter file in which to save the key \
    (/users/home/username/.ssh/id_dsa):

Enter passphrase (empty for no passphrase):passphrase
Enter same passphrase again: passphrase
Your identification has been saved in \
```

```
/users/home/username/.ssh/id_dsa.
Your public key has been saved in
   /users/home/username/.ssh/id_dsa.pub.
The key fingerprint is:
3 0:9f:ae:b6:7f:7e:55:e4:b2:7a:51:f0:95:44:5c:d1
```

2. Import the public key from the remote host to the local switch:

```
switch:username> sshutil importpubkey
   Enter user name for whom key is imported: username
   Enter IP address: Remote host IP Address
  Enter remote directory: ~username/.ssh
   Enter public key name(must have .pub suffix):id_dsa.pub
   Enter login name:username
   Password: *****
  public key is imported successfully.
```

3. Connect to switch using remote ssh client with the **-i** *private_key* option:

```
username@remotehost> ssh username@IP Address-i id_dsaIP Address-i id_dsaIP
 Address-i id_dsa
```

To display the imported public keys on a switch:

```
switch:username> sshutil showpubkeys
Enter user name whose ssh public key is to be displayed: username
user's public keys
ssh-dss AAAAB3NzaC1kc3MAAACBANXuRsJoIAOPFJtGuZVLfqvfSr\
DYPplWuFouOmTcmuNvpTnd+yoZ
u3C/lAu930HLTmhfxeke/NWRIdj2MJS8yTf30a0u4bf9MSNB8Pt453P/+ \
  7VHHxNBYsh+Z++Dv1hfcTeb

AMvrlooq0JVXmXfd0VKcC7AImzFYgRa/F0xZBe4JDkCAXztFk5wnAFy \
  UbyTWEoC955mkYGqZRydMrSNM
9wLCAf2DTxXxuHFujA1REL5NGdZqRWo2Sk5HLkYQQYM1w9r9vfK \
  QnFH3wYsnHV2sq7+tyRlXfwE416ee
chdwWVpmjgAAAIEAqxcaE1vY4o/cBq1Py621PaZTcfOHS3jjdKgSO \
  BKPCCVeNyx4gxnmqvihtyroeWAY
dBDK4CFqyhut16a/OmdFjn6iyiNR2SGV7X9xqkjPN8H4EhIPXGxoD \
  VOfY1Vdt3V3KUxVeEI+vTBI2KJd
PmmLfyEKZqCHOlwBx+HuuZP2BnU= username@host
```

To delete all imported public keys for a single user:

```
switch:username> sshutil delpubkeys
Enter user name for whom ssh public key is to deleted \
   or all for all users:username
WARNING: It deletes all the ssh public keys for user. \
   Do you want to proceed(Yes or No, default is No)?yes
ssh public keys associated to username are deleted.
```

To set up SSH public key authentication on a switch for outgoing connections:

1. Generate a private/public key pair on the local switch:

```
switch:username> sshutil genkey
Enter passphrase (empty for no passphrase):passphrase
Enter same passphrase again: passphrase
Key pair generated successfully.
```

2. Export the public key to a remote host:

```
switch:username> sshutil exportpubkey
  Enter IP address: remote host IP Address
  Enter remote directory: ~username/.ssh
  Enter login name:username
  Password:*****
  public key out_going.pub is exported successfully.
```

3. Append the public key to the authorized_keys file on the remote host:

To delete the private key on a switch:

```
switch:username> sshutil delprivkey
private key is deleted successfully.
```

SEE ALSO None

statsClear

Clears port and diagnostic statistics.

SYNOPSIS statsclear

[--slot slof]
[-uports itemlist]
[-bports itemlist]
[-use_bports value]

DESCRIPTION

Use this command to clear the port and diagnostics statistics for the specified list of blade or user ports.

You can issue this command on the FR4-18i blade in a Brocade chassis; however, the command is not supported by the Brocade platform and does not affect any other feature operations. This availability is offered to maintain consistency across a mixed-blade environment.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS

The following are optional:

--slot slot

Specifies the slot on which to operate. If this option is not specified, the default slot is assumed. The default slot is 0 and designed to operate on fixed-port-count products, if **-use_bports** sets with nonzero value.

-uports itemlist

Specifies the list of user ports for which statistics are to be cleared.

-bports itemlist

Specifies the list of blade ports for which statistics are to be cleared.

-use_bports value

Specify a nonzero value to clear the diagnostics statistics for the blade ports specified in **-bports** clears. A value of zero (0) clears the user ports specified in **-uports**. The default value is 0.

To clear port and diagnostic statistics:

switch:admin> statsclear -bports 1/10-1/62 -use_bports 1

SEE ALSO itemList

EXAMPLES

stopPortTest

Terminates the running **portTest**.

SYNOPSIS stopporttest [-ports itemlist]

DESCRIPTION Use this command to terminate the **portTest** command. Refer to the **portTest** help page for more

information.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

-ports itemlist

Terminates the test on the specified ports; this operand is optional; if omitted, the

test is terminated on all ports. Refer to the itemList help page for more

information.

EXAMPLES To stop the **portTest** command:

switch:admin> stopporttest

SEE ALSO portLoopbackTest, portTest, portTestShow, spinFab

supportFfdc

Modifies or displays the first-fault data capture (FFDC) daemon.

SYNOPSIS supportffdc [--disable | --enable | --show]

DESCRIPTION Use this command to disable or enable the FFDC events, or to display the current configuration. If

disabled, the daemon does not capture any data even when a message with FFDC attributes is logged.

FFDC is enabled by default. When executed without operands, the command prints the usage.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

--disable

Disables the FFDC.

--enable

Enables the FFDC.

--show

Displays the FFDC configuration parameters.

EXAMPLES To display the FFDC configuration:

switch:admin> supportffdc --show

First Failure Data Capture (FFDC) is disabled.

To enable the FFDC events:

switch:admin> supportffdc --enable

First Failure Data Capture (FFDC) is enabled.

SEE ALSO None

supportFtp

Sets, clears, or displays support FTP parameters and enables or disables auto file transfer.

SYNOPSIS si

supportftp [-S]

supportftp -s [-h host][-u username][-p password]
[-d remotedirectory] [-l protocol]

supportftp -t hours

supportftp -R

supportftp -e

supportftp -d

DESCRIPTION

Use this command to set, clear, or display **supportFtp** parameters. The parameters set by this command are used by the **supportSave** and **traceDump** commands.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-S

Displays the current **syppportFtp** parameters.

-s

Sets the **syppportFtp** parameters. The following operands are optional. If the **-s** option is specified without further operands, the command interactively prompts for these parameters.

-h host

Specifies the host. Provide an IP address or a server name. IPv4 and IPv6 addresses are supported. To specify the host by name, a DNS entry must exist for the server.

-u username

Specifies the user name. The user name must be less than 48 characters long.

-p password

Specifies the account password. The password must be less than 48 characters long. When using anonymous FTP, a password is not required.

-d remotedirectory

Specifies the remote directory where the trace dump files are stored. The directory name must be less than 48 characters long. Specifying the root directory as the remote directory (/) is not allowed.

-I protocol

Specifies the transfer protocol. Valid values are file transfer protocol (FTP), secure copy protocol (SCP), or secure FTP (SFTP).

-t hours

Specifies the time interval, in units of hours, at which the server connectivity is checked.

-R

Clears all supportFtp parameters.

-е

Enables auto file transfer. Trace dump files are automatically transferred to a designated FTP server. The server parameters must be set before you can enable

auto file transfer.

-d

Disables auto file transfer.

EXAMPLES To set the FTP parameters:

```
switch:admin> supportftp -s -h 1080::8:800:200C:417A \
     -u admin -p password -d support -l sftp
supportftp: ftp parameters changed.
```

To display the FTP parameters:

```
switch:admin> supportftp
Host IP Addr: 1080::8:800:200C:417A
User name:
                      admin
```

Remote Dir: support Auto Upload protocol: sftp

Auto-FTP: Off

To set FTP parameters interactively:

```
switch:admin> supportftp -s
Host IP Addr[1080::8:800:200C:417A]:192.168.67.126
User Name[admin]: admin
Password[*******]:password
Remote Dir[support]:
Auto upload protocol[ftp]:scp
Auto file transfer parameters changed
```

To set the time interval at which the FTP server connectivity is checked:

```
switch:admin> supportftp -t 24
supportftp: ftp check period changed.
```

To enable auto file transfer:

```
switch:admin> supportftp -e
support auto file transfer enabled.
```

To disable auto file transfer:

```
switch:admin> supportftp -d
support auto file transfer disabled.
```

SEE ALSO supportSave, supportShow, traceDump

supportSave

Saves RASLOG, TRACE, supportShow, core file, FFDC data, and other support information

SYNOPSIS

supportsave

supportsave [-n] [-c] [-k]
 [-u user_name -p password -h host_ip
 -d remote_dir -l protocol]

supportsave [-R]

supportsave [-U -d remote_dir]

supportsave [-t timeout_multiplier]

DESCRIPTION

Use this command to collect RASLOG, TRACE, **supportShow**, core file, FFDC data and other support information to a remote FTP location. On platforms that support USB, the information can also be stored on an attached USB device. On a dual-CP system, information is saved for the local and the remote CP. **SupportShow** information is available on Active and Standby CPs. To reduce the chance of missing the correct trace dump, **supportSave** retrieves old (the dump created prior to the current one) and new (the dump triggered by the command) trace dumps.

The files generated by this command are compressed before being sent off the switch. The core files and panic dumps remain on the switch after the command is run. The FFDC data are removed after the command has finished.

If there are blade processor (BP) blades installed on the switch, a support file (a.tar.gz file) is generated from each slot.

This command accepts IPv4 and IPv6 addresses. If the configured IP address is in IPv6 format, the RAS auto file transfer and event notification to syslog will not work in the case where the Fabric OS version is downgraded. You must reconfigure auto file transfer and syslog with IPv4 IP addresses.

In a Virtual Fabric environment, **supportSave** saves all chassis-based information and iterates through the defined switch-based information for all logical switches. Chassis permissions are required to execute this command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

If you use anonymous FTP to run **supportSave** on a chassis with multiple AP blades, configure the FTP Windows server to allow unlimited anonymous users.

OPERANDS

When invoked without operands, this command goes into interactive mode. The following operands are optional:

-n

Does not prompt for confirmation. This operand is optional; if omitted, you are prompted for confirmation.

-c

Uses the FTP, SCP, or SFTP parameters saved by the **supportFtp** command. This operand is optional; if omitted, specify the FTP, SCP, or SFTP parameters through command line options or interactively. To display the current **supportFTP** parameters, run **supportFtp** (on a dual-CP system, run **supportFtp** on the active CP).

The -c option is mutually exclusive with -u, -p, -h, and -d.

-k

Specifies that the **supportFtp** auto file transfer configuration transfer only core and FFDC files in noninteractive mode.

-u user_name

Specifies the user name for the FTP, SCP, or SFTP server. This operand is optional; if omitted, anonymous FTP is used.

-p password

Specifies the password for the FTP, SCP, or SFTP server. This operand is optional with FTP: if omitted, anonymous FTP is used.

-h host_ip

Specifies the IPv4 or IPv6 address for the remote server.

-d remote dir

Specifies the remote directory to which the file is to be transferred. When saving to a USB device, the predefined /support directory must be used.

-R

Removes all core files on the CP and BP. This option cannot be used with any other options.

-I protocol

Specifies the transfer protocol. Valid values are file transfer protocol (FTP), secure copy (SCP), or secure FTP (SFTP).

If you plan to use SCP to transfer files, it is important to test the **supportSave** command prior to its use with various SCP-mode services. Because the **supportSave** command makes several access requests to copy files, it is important that the SCP-mode service be configured so that passwords are not required for each attempted transfer by the **supportSave** command. Failure to configure the service correctly may result in significant delays in obtaining transferred output from the **supportSave** command.

When using secure copy (SCP), **supportSave** may create a directory specified by the **-d** option if it does not already exist and the parent directory has the appropriate permissions. Use of FTP requires the directory to exist on the remote server.

-U

Saves support data to an attached USB device. When using this option, a target directory must be specified with the **-d** option.

-t timeout_multiplier

Extends predefined **SupportSave** timeout values by the value of the timeout multiplier. Use this option to repeat the **supportSave** operation when **supportSave** completion indicates that one or more modules timed out during the process. For example, **-t 2** doubles the timeout values for each of the **SupportSave** modules. Valid multiplier values are 2 to 5. The default is 1.

EXAMPLES

To save RASLOG, TRACE, **supportShow**, and other support information to an FTP server in interactive mode:

```
switch:admin> supportsave
This command collects RASLOG, TRACE, supportShow, \
    core file, FFDC data
and then transfer them to a FTP/SCP/SFTP server \
    or a USB device.
This operation can take several minutes.
NOTE: supportSave will transfer existing trace dump \
    file first, then
```

```
automatically generate and transfer latest one. \
   There will be two trace dump
files transferred after this command.
OK to proceed? (yes, y, no, n): [no] y
Host IP or Host Name: 192.168.126.115
User Name: admin
Password: *****
Network Protocol(1-auto-select, 2-FTP, 3-SCP, 4-SFTP) [1]: 4
Remote Directory: /temp/support
Saving support information for chassis: HL51, module: RAS...
Saving support information for chassis: HL51, module: TRACE_OLD...
Saving support information for chassis: HL51, module: TRACE_NEW...

Saving support information for chassis:HL51,module:SSHOW_EX...
Saving support information for chassis: HL51, module: SSHOW_FABRIC...
(output truncated)
```

To collect support information on a Brocade 5100 and save it to an attached USB device (timeout values are doubled):

```
switch:admin> supportsave -U -d mysupportsave -t 2
This command collects RASLOG, TRACE, supportShow, \
   core file, FFDC data
and then transfer them to a FTP/SCP/SFTP server \
   or a USB device.
This operation can take several minutes.
NOTE: supportSave will transfer existing trace dump \
   file first, then
automatically generate and transfer latest one. \
   There will be two trace dump
files transferred after this command.
OK to proceed? (yes, y, no, n): [no] y
Saving support information for chassis:ras9, module:RAS...
Saving support information for chassis:ras9, module:TRACE OLD...
Saving support information for chassis:ras9,module:TRACE NEW...

SEE ALSO supportShow, supportFtp

supportShow

Displays switch information for debugging purposes.

SYNOPSIS supportshow

supportshow [slot /]port1[-port2] [lines]

DESCRIPTION

Use this command to display support information from groups of preselected Fabric OS and Linux commands and other support and debugging information. You can specify a port or a range of ports for which to display this information. These commands are organized by groups, but note that the order of the groups listed below is not the same as executed by the command.

The FCIP commands are supported only on the Brocade 7800/FX8-24 and FR4-18i platforms. On unsupported platforms, the command displays a "not applicable to this platform" message next to the FCIP command group.

SupportShow executes commands in the following command groups. Use **supportShowCfgenable** or **supportShowCfgDisable** to modify the settings for each group.

os

OS group commands, enabled by default.

exception

Exception group commands, enabled by default.

port

Port group commands, enabled by default.

fabric

Fabric group commands, enabled by default.

services

Service group commands, enabled by default.

security

Security group commands, enabled by default.

network

Network group commands, enabled by default.

portlog

Portlog group commands, enabled by default.

system

System group commands, enabled by default.

extend

Extend group commands, disabled by default.

filter

Filter group commands, disabled by default.

perfmon

Performance Monitor group commands, disabled by default.

ficon

FICON group commands, disabled by default.

iswitch

FC Router group commands, disabled by default.

asic_db

ASIC DB group commands, disabled by default.

fcip

FCIP group commands, disabled by default.

ag

Access Gateway group commands, disabled by default.

dce_hsl

DCE group commands, enabled by default.

crypto

Encryption group commands, disabled by default.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This is a diagnostic command and should only be run for diagnostic support.

Output generated by this command may vary by switch configuration and platform. Output may change without notice.

OPERANDS

This command has the following operands:

slot

On bladed systems only, specifies a slot number, followed by a slash (/).

port1[-por2]

Specifies a port or a range of ports for which to display **supportShow** information. this operand is optional; if omitted, the command displays information for all ports.

lines

Specifies the number of lines for the portLogDump output. This parameter is

valid only with the slot/port parameters.

EXAMPLES

To display debugging information for a single port on a Brocade 5300:

```

supportShowCfgDisable

Disables a group of commands under the supportShow command.

SYNOPSIS supportshowcfgdisable os | exception | port | fabric

| services | security | network | portlog | system | extend

| filter | perfmon | ficon | iswitch | asic_db | ag

| dce_hsl | crypto | fcip

DESCRIPTION Use this command to disable a group of commands under the **supportShow** command. Use the

supportShowCfgEnable command to enable groups of commands.

The FCIP commands are supported only on the Brocade 7800/FX8-24 and FR4-18i platforms and

cannot be configured to collect data on unsupported platforms.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

os

Disables the OS group commands.

exception

Disables the exception group commands.

port

Disables the port group commands.

fabric

Disables the fabric group commands.

services

Disables the service group commands.

security

Disables the security group commands.

network

Disables the network group commands.

portlog

Disables the portlog group commands.

system

Disables the system group commands.

extend

Disables the extend group commands.

filter

Disables the filter group commands.

perfmon

Disables the Performance Monitor group commands

ficon

Disables the FICON group commands.

iswitch

Disables the FC Router group commands.

asic_db

Disables the ASIC DB group commands.

ag

Disables the Access Gateway group commands.

dce_hsl

Disables the DCE group commands.

crypto

Disables the encryption group commands

fcip

Disables the FCIP group commands. Supported only on the Brocade

7800/FX8-24 and FR4-18i.

EXAMPLES To disable the OS group of commands under the **supportShow** command:

switch:admin> supportshowcfgdisable os

Config update Succeeded

SEE ALSO supportShow, supportShowCfgEnable, supportShowCfgShow

supportShowCfgEnable

SEE ALSO supportShow, supportShowCfgDisable, supportShowCfgEnable

switchBeacon

Sets switch beaconing mode on or off.

SYNOPSIS switchbeacon [mode]

DESCRIPTION

Use this command to enable or disable switch beaconing mode. Switch beaconing can be used to locate a failing unit.

When beaconing mode is turned on, the port LEDs flash amber, left to right and right to left, from port 0 to the highest port number and back to port 0. The beaconing mode continues until you turn it off.

The beaconing LED pattern continues until you turn it off. Beaconing mode takes over the port LEDs. Other commands are still executable and functional. The normal flashing LED pattern (associated with an active, faulty or disabled port for example) is suppressed and only the beaconing pattern is shown. However, if diagnostic frame-based tests (such as **portLoopbackTest**) are executed, two patterns are interleaved. The diagnostic test flickers the LEDs green and the beaconing mode runs the LEDs amber at the same time.

Use the switchShow command to display the status of beaconing.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

mode

Specify 1 to enable beaconing mode or 0 to disable beaconing mode. This operand is optional. If no operand is specified, the current value is displayed.

EXAMPLES

To turn beaconing mode on:

switch:admin> switchbeacon 1

To turn beaconing mode off:

switch:admin> switchbeacon 0

SEE ALSO

switchShow

switchCfgPersistentDisable

Disables a switch persistently.

SYNOPSIS switchcfgpersistentdisable

DESCRIPTION Use this command to persistently disable the switch. All Fibre Channel ports are taken offline. If the

switch was part of a fabric, the remaining switches reconfigure. The switch remains disabled even after a

reboot.

As each port is disabled, the front panel LEDs change to a slow-flashing amber.

You can temporarily enable a persistently disabled switch with the switchEnable command. A

temporarily enabled switch remains disabled after a reboot.

NOTES Performance Monitoring cannot be added to any port on a persistently disabled switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details

OPERANDS None

EXAMPLES To disable a switch persistently:

switch:admin> switchcfgpersistentdisable
Switch's persistent state set to 'disabled'

SEE ALSO switchDisable, switchEnable, switchCfgPersistentEnable, switchShow

switchCfgPersistentEnable

Enables a switch persistently.

SYNOPSIS switchcfgpersistentenable

DESCRIPTION

Use this command to persistently enable a persistently disabled switch. All Fibre Channel ports that passed the power-on self-test (POST) are enabled and come online if connected to a device, or remain offline if disconnected. The switch may need to be enabled if it was previously disabled to make configuration changes or to run diagnostics.

If the switch is connected to a fabric, it rejoins the fabric. If this switch remains the principal switch, it assigns itself a domain ID. If another switch assumes the principal role, then this switch becomes a subordinate switch, and accepts a domain ID from the principal. Refer to the FC-SW specification for a complete description of this process.

As each port is enabled, the front panel LEDs change from slow-flashing amber to green for online ports, or to nonflashing amber for ports that do not initialize. Disconnected ports remain unlit.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To persistently enable a previously persistently disabled switch:

switch:admin> switchcfgpersistentenable
Switch's persistent state set to 'enabled'

SEE ALSO switchDisable, switchEnable, switchCfgPersistentDisable, switchShow

switchCfgSpeed

Configures the speed for all ports on a switch.

SYNOPSIS switchcfgspeed speed

DESCRIPTION

Use this command to configure the port speed on a switch. This command sets the speed for all user ports. If any port on the switch is not capable of the specified speed setting, an error message is displayed for that port. The configuration is saved in nonvolatile memory and persists across switch reboots or power cycles.

On Condor 3-based platforms, the **switchCfgSpeed** command checks if the requested speed is allowed, based on the combination configured for the octet that contains the first eight physical ports of the switch or blade. If the requested speed is not supported by the current octet speed combination, this command logs a RASlog message and moves on to the next port. Use the **portCfgOctetSpeedCombo** command to the set the suggested combination before re-executing the **switchCfgSpeed** command.

Use the **portShow** command to display actual port speed settings. Use the **portCfgShow** command to display user-configured speed settings.

NOTES

This configuration cannot be set on VE_Ports or VEX_Ports.

Speed configuration is not applicable to FCoE ports.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

speed

Specifies the speed for all ports on a switch. This operand is required. Valid values are as follows:

0

Autosensing mode. The port automatically configures for the highest speed.

1

The port is set at a fixed speed of 1 Gbps (not supported on 10G and 16G

platforms).

2

The port is set at a fixed speed of 2 Gbps.

4

The port is set at a fixed speed of 4 Gbps.

8

The port is set at a fixed speed of 8 Gbps.

16

The port is set at a fixed speed of 16 Gbps (not supported on 8G platforms).

EXAMPLES

To set the autosensing mode for all ports on a switch:

```
switch:admin> switchcfgspeed 0
Committing configuration...done.
```

SEE ALSO

portCfgOctetSpeedCombo, portCfgSpeed, portShow

switchCfgTrunk

Enables or disables trunking on all the ports of a switch.

SYNOPSIS switchcfqtrunk mode

DESCRIPTION

Use this command to enable or disable trunking on all the ports of a switch. Use portCfgTrunkPort to enable or disable trunking on a single port.

When the command is executed to update the trunking configuration, the ports to which the configuration applies are disabled and subsequently re-enabled with the new trunking configuration. Traffic through these ports may be temporarily disrupted. The command issues a message that lists the VE/VEX Ports to which the configuration does not apply.

Although trunking configuration changes are applied at the switch level, they are tracked as a per-port attribute and no switch-wide attribute is maintained to keep track of these changes. Whenever a new port comes online as part of the switch, you must reapply the trunking configuration. For example, If you remove a blade from a chassis while trunking is enabled for the ports on the blade, and you disable trunking on the switch after you removed the blade, the blade ports will come online with trunking enabled after you reinsert the blade. To avoid potentially disruptive behavior, reapply the trunking configuration.

Trunking on Inter-Chassis Link (ICL) ports is always enabled and cannot be turned off by this command.

Disabling trunking fails if a Trunk Area (TA) is enabled on the port. Use the portTrunkArea command to disable the TA on all ports before disabling trunking.

NOTES

Enabling trunking requires an ISL Trunking license. You may disable trunking without a license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operand is required:

mode

Specify 1 to enable trunking on all ports. Specify 0 to disable trunking on all ports.

EXAMPLES

To enable trunking on all ports of a switch:

```
switch:admin> switchcfgtrunk 1
Configuration applied to all ports except the following \
VE/VEX_Ports (ports 176 - 191).
```

To disable trunking on all ports of a switch:

```
switch:admin> switchcfgtrunk 0
Committing configuration...done.
```

SEE ALSO

portCfgShow, portCfgTrunkPort, portShow, portTrunkArea, switchShow

switchDisable

Disables all user ports on a switch.

SYNOPSIS switchdisable

DESCRIPTION

Use this command to disable all user ports on a switch. All Fibre Channel ports are taken offline. If the switch was part of a fabric, the remaining switches reconfigure. As each port is disabled, the front panel LED changes to a slow-flashing amber.

The switch must be disabled before making configuration changes or before running offline diagnostic tests. Commands that require the switch to be disabled generate an error message if invoked while the switch is enabled. It is not necessary to disable the switch before rebooting or powering off.

When this command is executed on a logical switch, only the ports allocated to the logical are disabled. To disable the entire chassis, use the **chassisDisable** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To disable the switch:

switch:admin> switchdisable

SEE ALSO

bladeEnable, bladeDisable, chassisEnable, chassisDisable, switchCfgPersistentDisable, switchCfgPersistentEnable, switchShow

switchEnable

Enables all user ports on a switch.

SYNOPSIS switchenable

DESCRIPTION

Use this command to enable all user ports on a switch. All Fibre Channel ports that passed the power-on self test (POST) are enabled. They can come online if connected to a device, or remain offline if disconnected. Use **switchEnable** to re-enable the switch after making configuration changes or running offline diagnostics.

If the switch is connected to a fabric, it rejoins the fabric. If the switch remains the principal switch, it assigns itself a domain ID. If another switch assumes the principal role, then the re-enabled switch becomes a subordinate switch and accepts a domain ID from the principal.

As each port is enabled, the front panel LED changes to green for online ports, or to amber for uninitialized ports. Disconnected ports remain unlit.

When this command is executed on a logical switch, only the ports allocated to the logical switch are enabled. To enable the entire chassis, use the **chassisEnable** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To enable a switch:

switch:admin> switchenable

SEE ALSO

bladeEnable, bladeDisable, chassisDisable, chassisEnable, switchCfgPersistentDisable, switchCfgPersistentEnable, switchDisable, switchShow

switchName

Displays or sets the switch name.

SYNOPSIS switchname [name]

DESCRIPTION

Use this command to display or set the switch name. All switches have a symbolic name that is primarily used for switch management. This name is shown in the Fabric OS CLI prompt, under each switch icon in Web Tools, and in the output of various Fabric OS Commands, such as **fabricShow**.

Use this command with the *name* operand to assign a new switch name. Enter this command without an operand to display the current switch name.

Changing the switch name causes a domain address format registered state change notification (RSCN) to be issued. Refer to the FC-FLA specification for a description of RSCNs).

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

name

Specifies the name for the switch. A switch name can include up to 30 characters. The name must begin with a letter and can consist of letters, numbers, hyphens, and underscore characters. Spaces are not allowed. This operand is optional; if omitted, this command displays the current switch name.

EXAMPLES

To change the switch name (note the change in the prompt text):

switch:admin> switchname brocade_demo_1298765_AY4TYI60
brocade_demo_1298765_AY4TYI60:admin> switchname
brocade_demo_1298765_AY4TYI60

SEE ALSO chassisShow, switchShow

switchShow

Displays switch and port status.

SYNOPSIS

switchshow

switchshow [-slot s/ot] -portname

switchshow [-portcount |-iscsi | -qsfp]

DESCRIPTION

Use this command to display switch, blade, and port status information. Output may vary depending on the switch model.

When used without operands, **switchShow** displays the following information:

switchName

Switch name.

switchType

Switch model and revision numbers.

switchState

Switch state: Online, Offline, Testing, or Faulty. When you issue the switchcfgPersistentDisable command followed by the switchEnable

command, the switch state changes to, "Online (Temporary)". The switch remains

in this state until you issue the switchcfgPersistentEnable command.

switchMode

Switch operation mode: Access Gateway (if AG is enabled).

switchRole

Switch role: Principal, Subordinate, or Disabled.

switchDomain

Switch domain ID: 1 to 239.

switchld

Switch embedded port D_ID.

switchWwn

Switch world wide name (WWN).

switchBeacon

Switch beaconing state: On or Off.

zoning

The name of the active zone is displayed in parentheses. Active only when

Access Gateway mode is disabled.

FC Router

FC Router state: On or Off.

FC Router BB Fabric ID

The backbone fabric ID for FC routing.

Fabric Name

The name assigned to the fabric. The fabric name is set with the **fabricName**

command.

Allow XISL Use

Allows the switch to use interswitch links (XILS) in the base fabric to carry traffic to

this logical switch. Values are ON or OFF.

LS Attributes

On a switch in Virtual Fabric mode, this field displays logical switch attributes, including the fabric ID associated with the logical switch, the switch role (default switch or base switch), and the fabric Address Mode (0, 2 or 3). If Virtual Fabrics are disabled, only the Address Mode is displayed. The fabric Address Mode value is set by the configure command (Enable a 256 Area Limit).

The switch summary is followed by one-line description for non-EX_Ports and one or two lines for EX_Ports:

Index

Port index is a number between 0 and the maximum number of supported ports on the platform. The port index identifies the port number relative to the switch.

Slot

Slot number; 1-12.

Port

Port number; 0-15, 0-31, or 0-63.

Address

The 24-bit Address Identifier.

Media

Media types include the following:

--

No module present. Applicable to all port types.

cu

Displays when the copper (default) GbE port ge0 or ge1 is active (refer to **portCfgGeMediaType** for more information). If the optical GbE port is active and an SFP is installed (copper or optical), "id" is displayed. If nothing is installed on the optical port, the Media field shows "--". The "cu" field also displays for interchassis links (ICLs).

id

Serial ID. Indicates that an SFP is installed. Use **sfpShow** to get more information about the SFP, including the serial number.

Speed

The speed of the port. Valid port speeds include the following:

1G

1 Gbps fixed transfer speed (not supported on 16 Gbps-capable ports)

N1

1 Gbps negotiated transfer speed (not supported on 16 Gbps-capable ports)

2G

2 Gbps fixed transfer speed (only supported with use of 8 Gbps SFPs)

N2

2 Gbps negotiated transfer speed (only supported with use of 8 Gbps SFPs)

4G

4 Gbps fixed transfer speed

N4

4 Gbps negotiated transfer speed

8G

8 Gbps fixed transfer speed

N8

8 Gbps negotiated transfer speed

10 Gbps fixed transfer speed

N10

10 Gbps negotiated transfer speed

16G

16 Gbps fixed transfer speed

N16

10 Gbps negotiated transfer speed

ΑN

Autonegotiating

UN

Unknown

State

Port state information. Valid states include the following:

No_Card

No interface card present.

No_Module

No module (GBIC or other) present.

Mod_Val

Module validation in process.

Mod_Inv

Module speed mismatch or incompatible SFP.

No_Light

The module is not receiving light. This state is not applicable to Condor 3-based

interchassis link (ICL) ports.

No_SigDet

No signal is detected on the port. For Condor 3-based interchassis link (ICL) ports, this state replaces the No_Light indicator. It indicates that a quad small form-factor pluggable (QSFP) has been installed but is not connected with a

cable.

No_Sync

The module is receiving light but is out of sync.

In_Sync

The module is receiving light and in sync.

Laser_Flt

The module is signaling a laser fault.

Port_Flt

The port is marked faulty.

Diag_Flt

The port failed diagnostics.

Lock_Ref

The port is locking to the reference signal.

Testing

The port is running diagnostics.

Offline

A port connection is not established (for virtual ports only).

Online

The port is up and running.

Proto

Protocol support by GbE port. Valid protocols include the following:

ISCSI

The port supports ISCSI (deprecated).

FCIP

The port supports FCIP.

FCoE

The port supports Fibre Channel over Ethernet.

comment

Optionally displays one of the following:

Copper or Optical

Displays which GbE port is currently active: **Copper** indicates that the RJ45 GbE port is currently active. Only copper connections are accepted (default). **Optical** indicates that the currently active GbE port accepts both copper and optical connections (SFPs). This parameter is set by the **portCfgGeMediaType** command, and applies only to the ge0 and ge1 ports on the Brocade 7800.

Disabled

The port is disabled. Port disable reasons may be stated in parenthesis:

Disabled (FMS Mode)

The port is disabled and in Ficon Server Management mode.

Disabled (No area available for PID assignment)

The port is disabled because a PID could not be assigned for the stated reason.

Disabled (persistent)

This port has been disabled with the **portCfgPersistentDisable** command.

Disabled (Persistently disabled port)

This port has been disabled for unspecified reasons.

Bypassed

The port is bypassed (loop only).

Loopback

The port is in loopback mode.

D_Port

Diagnostic port; displays the world wide name (WWN) of the remote switch.

 E_Port

Fabric port; displays the world wide name (WWN) and name of the attached switch. If the port is configured as an EX_Port, the WWN of the attached switch is

the same as the router.

 F_Port

Point-to-point port; displays the WWN of the attached N_Port. If that specific F_Port receives 1 FDISK frame, **switchShow** displays the total number of NPIV Public ports as 1, for example: F_Port 1 NPort + 1 NPIV devices.

G_Port

Point-to-point port, but not yet E_Port or F_Port.

L_Port

Loop port; displays the number of NL_Ports.

EX_Port

Router port; displays the WWN of the attached edge switch.

VF Port

FCoE Virtual F_Port. For these ports, the number of NPIV or external device logins is displayed ("n VN-Port(s)"), instead of the WWN of the internal port.

VF_Port Disabled

FCoE Virtual F_Port is disabled.

Mirror Port

The port is a mirror port.

(Trunk master)

The port is the master port in a group of trunking ports.

(Trunk port, master is port #x)

The port is configured as a trunking port; the master port is port #x.

(upstream)

The E_Port is an upstream path toward the principal switch of the fabric.

(downstream)

The E_Port is a downstream path away from the principal switch of the fabric.

FICON Persistent DID

This port has been disabled, because the switch could not obtain its configuration domain ID during the fabric reconfiguration when **fmsmode** was enabled. See the **ficonCupSet** help page for more information.

Fabric ID conflict

Two different fabrics have been assigned the same fabric ID. Applicable only to EX_Ports and Logical Fabric environments.

Fabric ID oversubscribed

One fabric has been assigned two different fabric IDs (EX_Ports only).

AoQ

Application-oriented QoS; indicates that an F_Port or N_Port has negotiated a link that is capable of quality of service (QoS). Both sides of the link have QoS capability and agreed on the protocol. The link could be between an HBA and an Access Gateway, between an Access Gateway and an edge switch, or between an HBA and an edge switch.

LB mode

If the Access Gateway cannot negotiate QoS capabilities with the edge switch, an HBA connected to the Access Gateway will not be able to negotiate a QoS link with the Access Gateway.

(logical)

A Server Application Optimization (SAO) license is required to enable QoS at the HBA. An Adaptive Networking license is required both at the Access Gateway and the edge switch to enable QoS.

(logical)

Indicates a logical port. The switchShow output shows all logical ports currently present in the logical switch. The command displays -1 for the slot for logical ports and the user port number for slot port. The logical port numbers are not persistent and may change when the logical interswitch links (LISLs) are deleted and recreated. A logical port is shown to be in one of the following states: E_Port (if the port is online), offline, or disabled. When the port is disabled, a reason is provided.

segmented

Indicates a segmented or disabled port along with one of the following segmentation reasons:

(Encrypt incompatible)

Port segmentation or port disable due to mismatched configurations.

(Compress incompatible)

Port segmentation or port disable due to mismatched configurations.

(Encrypt limitation)

Port segmentation or port disable due to reaching encryption limitations.

(Compress limitation)

Port segmentation or port disable due to reaching compression limitations.

(Authentication failure)

Port segmentation or port disable due to authentication failure.

(Type mismatch)

D_Port configuration mismatch between local and remote switch.

When used with the **-slot** option, the command displays the following blade-specific information:

slot

Slot number.

Blade Type

Type of blade, for example, Core blade or AP blade. Refer to the slotShow

command for a listing of supported blade types.

ID

A numeric blade ID that specifies the blade type. Refer to the **slotShow** command

for a listing of supported blade IDs.

Status

Enabled or disabled.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

On the Brocade 8000, the Proto column identifies the FCoE ports of the switch. For all FCoE ports, the speed is 10 Gbps. The default configuration of an FCoE port is an F_Port configuration. After a successful reboot switchShow displays all FCoE ports as online. For each FCoE port, the FCoE controller WWN is shown. FCoE ports are not configurable with the Fabric OS port commands. Use the FCoE commands instead.

If a port is configured as a long distance port, the long distance level is displayed in the format of Lx, where x represents the long distance level number. See portCfgLongDistance for the level description.

When a port is configured as an N_Port and is online, **switchShow** displays its type as an N_Port. Also, switchShow displays the WWN of the border switch attached to this N_Port as a 24-bit Port Identifier assigned to this port by the enterprise fabric.

In an AD context, if one of the L_Ports or NPIV Ports is a part of the current AD, the complete device information attached to the port is displayed.

OPERANDS This command has the following operands:

-slot slot

Displays blade information. You can specify this operand with $\mbox{-} \mbox{portname},$ but not

with any other operand.

-portname

Displays the name for each port on the switch. The port name is set by the **portName** command. You can specify this operand with **-slot**, but not with any

other operand.

-portcount

Displays the number of ports on the switch. This operand is exclusive.

-iscsi

Displays the number of ports on the iSCSI sessions associated with GbE ports in

a switch. This operand is exclusive. (Deprecated)

-qsfp

Displays the output of the **switchShow** command with a QSFP column added. If a QSFP is installed on the port, the QSFP number is displayed for the port. This number corresponds to the physical QSFP number that can be found on the front of each Core Blade. A double dash (--) indicates that no QSFP is present.

EXAMPLES To display the port count:

```
switch:admin> switchshow -portcount
FC ports = 198, GE ports = 12
```

To display GbE ports with iSCSI sessions:

To display a QoS-capable Core Access Gateway with online AoQ F_Ports and N_Ports:

```
switch:admin> switchshow
switchName: Spirit_125
switchType: 66.1
switchState: Online
```

To display QSFP information on a Brocade DCX 8510-4:

- Ports 3/60-63 indicate no QSFP is present.
- Slot 5 and 8 have QSFPs installed and the number is the group ID.
- Port 5/6 is an example of non-contiguous ports crossing QSFP group boundaries.

To display media type information (relevant output excerpts only):

The following example shows switchshow output for the ge0 and ge1 ports on a Brocade 7800. The ge0 port is a copper port (default). The ge1 has an SFP installed (copper or optical):

```
[...]
ge0 cu
         1G No_Sync
                     FCIP Copper
gel id
         1G No_Light FCIP
ge2 --
       1G No_Module FCIP
ge3 --
        1G No_Module FCIP
ge4 id 1G Online FCIP
ge5 --
       1G No_Module FCIP
```

This example shows switchshow output for a Brocade 5100. Port 31 has an SFP installed. Nothing is installed on Port 32.

```
[...]
     421f00 id N4 In_Sync FC Disabled
31 31
32 32 422000 --
                  N8
                      No_Module FC Disabled
[...]
```

The **sfpShow** output for the same switch displays the serial number for the SFP.

```
Port 31: id (sw) Vendor: BROCADE Serial No: UAF1081800000MK
 Speed: 200,400,800_MB/s
Port 32: --
[...]
```

switchStatusPolicySet

Sets the policy parameters that determine the overall switch status.

SYNOPSIS switchstatuspolicyset

DESCRIPTION

Use this command to set policy parameters for calculating the overall status of the switch. The policy parameter values determine how many failed or faulty units of each contributor are allowed before triggering a status change in the switch from HEALTHY to MARGINAL or DOWN.

For some components, a single contributor can force the overall status of the switch to MARGINAL or DOWN. For example, assuming that the switch contributor values are set to the default values, the presence of one faulty fan in a Brocade 6510 would set the overall switch status to MARGINAL. Two faulty fans would set the overall switch status to DOWN.

This command runs interactively and prompts you to accept or change the default value for each supported contributor. The unit for thresholds (both default and user-defined) of MarginalPorts, FaultyPorts, ErrorPorts, and MissingSFPs are calculated as a percentage of the current number of physical ports present in the switch at any given moment. For example, the input value of 25.00 indicates 25% of all physical ports. VE_Ports and FCoE Ports are excluded from the calculation. The percentage supports decimal values of up to two decimal points.

The following component thresholds are configurable. Components and value ranges are platform-dependent:

PowerSupplies

Absent or failed power supplies, and power supplies that are not in the correct slot

for redundancy.

Temperatures

Number of units with out-of-range temperature settings or faulty temperature

sensors.

Fans

Number of faulty fans.

WWN

Number of faulty WWN cards.

CP

Number of Control Processors down.

Blade

Number of faulty Blades.

CoreBlade

Number of faulty core blades.

Flash

Out of range flash memory.

MarginalPorts

Percentage of ports exceeding configured Fabric Watch thresholds.

FaultyPorts

Percentage of ports with hardware-related port faults.

MissingSFPs

Percentage of ports with missing SFPs (small form-factor pluggables) or SFPs

installed but not cabled.

ErrorPorts

None

Percentage of ports segmented and disabled due to security violations or Fabric Watch port fencing.

To determine the current status of the switch for each component monitored issue the switchStatusShow command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

EXAMPLES

To change the switch policy parameters on a Brocade 6510:

```
switch:admin> switchstatuspolicyset
```

To change the overall switch status policy parameters

The current overall switch status policy parameters:

```

Policy parameter set has been changed

SEE ALSO fanShow, psShow, switchStatusPolicyShow, switchStatusShow, tempShow

switchStatusPolicyShow

Displays the policy parameters that determine the overall switch status.

SYNOPSIS switchstatuspolicyshow

DESCRIPTION

Use this command to view the current policy parameters set for the switch. These policy parameters determine the number of failed or nonoperational units allowed for each contributor before triggering a status change in the switch. For port-related contributors, the numbers are expressed as a percentage of physical ports present in the switch at any given time.

The command displays the current parameters in a three-column format. Refer to the Examples section for an illustration. The first column indicates the contributor, the second column indicates the minimum number that contributes to the DOWN status, and the third column indicates the minimum number that contributes to the MARGINAL status. The policy parameters are set by the switchStatusPolicySet command. Not all policies are supported on all platforms. Refer to the switchStatusPolicySet help page for more information.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display the switch policy parameters Brocade DCX 8510-8:

switch:admin> switchstatuspolicyshow

The current over	all switch	status	policy	parameters:
	Down Mar	ginal		
PowerSupplies	0	0		
Temperatures	0	0		
Fans	1	0		
NWW	0	0		
CP	0	0		
Blade	0	0		
CoreBlade	0	0		
Flash	0	0		
MarginalPorts	0.00%[0]		0.00%[0]
FaultyPorts	0.00%[0]		0.00%[0]
MissingSFPs	0.00%[0]		0.00%[0]
ErrorPorts	0.00%[0]		0.00%[0]
Number of ports: 4				

SEE ALSO fanShow, psShow, switchStatusPolicySet, switchStatusShow, tempShow

switchStatusShow

Displays overall switch status.

SYNOPSIS switchstatusshow

DESCRIPTION

Use this command to display the overall status for a switch. In addition, users with a Fabric Watch license are able to view a listing of unhealthy ports that includes the port index number, the port name, and the port status.

This command displays the following information: the overall switch status, and the status of the following contributors:

- Report Time
- Switch Name
- IP address
- Switch State: HEALTHY, MARGINAL, or DOWN
- Duration: hours and minutes (HH:MM) the switch has been in the current state
- Power supplies
- Temperatures
- Fans
- WWN servers (dual-CP systems only)
- Standby CP (dual-CP systems only with HA enabled)
- Blades (bladed systems only)
- Flash
- Marginal ports
- Faulty ports
- Error Ports

Status values are HEALTHY, MARGINAL, or DOWN, depending on whether thresholds established by **switchStatusPolicySet** have been exceeded. The overall status is based on the most severe status of all contributors.

Refer to switchStatusPolicySet for details on the calculation of contributors and overall switch status.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To display a switch health report on a Brocade 6510 with one faulty port:

```
switch:user> switchstatusshow
                          Report time: 03/12/2011 08:48:00 PM
Switch Health Report
Switch Name: ras220
IP address:
               10.20.10.220
SwitchState:
               MARGINAL
Duration:
               47:42
Power supplies monitor HEALTHY
Temperatures monitor
                       HEALTHY
Fans monitor
                       HEALTHY
Flash monitor
                       MARGINAL
```

Marginal ports monitor HEALTHY Faulty ports monitor HEALTHY Missing SFPs monitor HEALTHY Error ports monitor HEALTHY

Port 032 port32 is FAULTY

To display a switch health report on Brocade DCX 8510-8:

switch:user> switchstatusshow

Switch Health Report Report time: 03/12/2011 12:57:01 PM

Switch Name: VF128_CDCX16_114057

IP address: 10.20.114.57 SwitchState: HEALTHY Duration: 44:16

Power supplies monitor HEALTHY Temperatures monitor HEALTHY Fans monitor HEALTHY
WWN servers monitor HEALTHY
CP monitor HEALTHY
Blades monitor HEALTHY
Core Blades monitor HEALTHY
Flash monitor HEALTHY Marginal ports monitor HEALTHY Faulty ports monitor HEALTHY Missing SFPs monitor HEALTHY Error ports monitor HEALTHY

All ports are healthy

SEE ALSO fanShow, psShow, switchStatusPolicySet, switchStatusPolicyShow, tempShow

switchUptime

Displays the amount of time the switch has been operating.

SYNOPSIS switchuptime

DESCRIPTION Use this command to display the current time and the amount of time that the switch has been

operational.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To view the uptime for the switch:

> switch:user> switchuptime 9:50pm up for 20 mins

SEE ALSO None

switchViolation

Dumps the DCC violations for a switch.

SYNOPSIS switchViolation --dump -dcc

DESCRIPTION Use this command to display all Device Connection Control (DCC) violations that have occurred on a

switch. Internally the command searches "errdumpall" for the DCC violations. For each DCC violation,

the command displays the device WWN and the port where the violation occurred.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

This command can be executed on both active and standby CPs. This command does not support High

Availability (HA).

OPERANDS This command has the following operands. If executed without operands, the command prints the usage.

--dump

Displays specified policy violation.

-dcc

Specifies the violation type as DCC.

EXAMPLES To display DCC violations for a switch:

switch:admin> switchviolation --dump -dcc

Device WWN Port
-----22:00:00:04:cf:75:59:87 10

SEE ALSO None

syslogdFacility

Sets or displays the syslog facility.

SYNOPSIS syslogdFacility [-I level]

DESCRIPTION

Use this command to set the syslog facility to a specified log file, or use this command without operands to display the current syslog facility. The syslog daemon (syslogd) reads and forwards system messages to the log file specified by this command. You must configure the servers to receive system messages by adding them with the **syslogdlpAdd** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-I level

Specifies the syslog facility. Valid levels are 0 through 7. The default is 7. This operand is optional; if omitted, the current facility is displayed.

0

LOG_LOCAL0

1

LOG_LOCAL1

2

LOG_LOCAL2

3

LOG_LOCAL3

4

LOG_LOCAL4

5

LOG_LOCAL5

6

LOG_LOCAL6

7

LOG_LOCAL7 (default)

EXAMPLES

To set the syslog facility to LOG_LOCAL1:

switch:admin> syslogdfacility -1 1
Syslog facility changed to LOG_LOCAL1

To display the current setting:

switch:admin> syslogdfacility
LOG_LOCAL1

SEE ALSO

syslogdlpAdd, syslogdlpRemove, syslogdlpShow

syslogdlpAdd

Configures a switch to forward system messages to specified servers.

SYNOPSIS syslogdipadd ip address

DESCRIPTION

Use this command to configure a switch to forward all error log entries to the syslog daemon (syslogd) of one or more specified servers. The syslog daemon is a process available on most UNIX systems that reads and forwards system messages to the appropriate log files or users, depending on the system configuration. Up to six servers are supported.

Only one syslogd server can be specified at any given time. To configure more than one server, the command must be executed for each server.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

ip_address

Specifies the IP address of the server running syslogd in IPv4 or IPv6 format.

EXAMPLES

To add an IP address to the list of machines to which system messages are sent:

```
switch:admin> syslogdipadd 1080::8:800:200C:417A
switch:admin> syslogdipshow
syslog.1 1080::8:800:200C:417A
```

To add a second IP address to the existing syslogd server configuration:

```
switch:admin> syslogdipshow
         1080::8:800:200C:417A
syslog.1
syslog.2 192.168.163.234
```

switch:admin> syslogdipadd 192.168.163.234

SEE ALSO

errShow, syslogdFacility, syslogdlpRemove, syslogdlpShow

syslogdlpRemove

Removes a server that is running the syslog daemon.

SYNOPSIS syslogdipremove ip_address

DESCRIPTION Use this command to remove a server that is running the syslogd process and to which system

messages are sent from the syslog server configuration on the switch. IPv6 and IPv4 syslogd addresses

are supported. Use syslogdIPShow to view the current syslog server configuration.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operand:

ip_address

Specifies the IP address of the server running syslogd.

EXAMPLES To remove the IP address 1080::8:800:200C:417A from the list of machines to which system messages

are sent:

switch:admin> syslogdipshow
syslog.1 1080::8:800:200C:417A

switch:admin> syslogdipremove 1080::8:800:200C:417A

SEE ALSO errShow, syslogdFacility, syslogdIpAdd, syslogdIpShow

syslogdlpShow

Displays all syslog daemon IP addresses.

SYNOPSIS syslogdipshow

DESCRIPTION Displays the list of servers that are running the syslogd daemon and to which system messages are sent.

Servers are specified in the configuration database by IP address. IPv4 and IPv6 addresses are

supported.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display all syslog daemon IP addresses configured on a switch:

switch:admin> syslogdipshow

syslog.1 1080::8:800:200C:417A

SEE ALSO errShow, syslogdFacility, syslogdIpAdd, syslogdIpRemove

sysMonitor

Configures Fabric Watch thresholds for environment and system resources.

SYNOPSIS

```
sysmonitor --config class -area area
   [-highthreshold -value value]
   [-trigger above | below -action actions]
   [-lowthreshold -value value]
   [-trigger above | below -action actions]
   [-buffer value] [-nosave]
svsmonitor --apply class -area area
   [-action_level def | cust] [-thresh_level def | cust]
sysmonitor --cancel class -area area
   [-action_level def | cust] [-thresh_level def | cust]
svsmonitor --pause | --continue class
   -area area[,area,...] | all
   -index index | all
sysmonitor --show [-class class][-area area]
   [[-current]| [[-action level def | cust]
   [-thresh_level def | cust]]]
sysmonitor --config mem | cpu
   [-poll polling_interval] [-retry number_of_retries]
   [-limit high_usage_limit][-action action]
   [-high limi high limit] [-low limit low limit]]
   sysmonitor --show mem | cpu
   sysmonitor --help
```

DESCRIPTION

Use this command to configure thresholds for Fabric Watch event monitoring for temperature and system resources on the switch. The following operations are supported by this command:

- Configure thresholds for Fabric Watch event monitoring and reporting for the environment and resource classes. Environment thresholds enable temperature monitoring, and resource thresholds enable monitoring of flash memory. This command follows a transaction model. Configuration changes are saved persistently to nonvolatile storage, but the changes do not take effect until you execute --apply. The --apply option allows you to toggle between default settings and your own saved custom configuration and to apply actions and thresholds separately. You may choose to use default thresholds together with a customized subset of available actions, or you may modify some of the thresholds and use the default actions. Use the -nosave option to save the configuration nonpersistently, and use --cancel to remove a nonpersistent configuration.
- Configure memory or CPU usage parameters on the switch or display memory or CPU usage. Configuration options include setting usage thresholds which, if exceeded, trigger a set of specified Fabric Watch alerts. You can set up the system monitor to poll at certain intervals and specify the number of retries required before Fabric Watch takes action. Configuring thresholds for CPU and memory does not follow the transaction model of the typical Fabric Watch command. The --apply and --cancel option are not valid in this context.

If any configured area exceeds the currently effective threshold settings, the Fabric Watch daemon can take one or more of the following actions:

- Send an SNMP message.
- Log a RAS log message.
- Send an E-mail alert (valid only for the environment and resource class).

Fabric Watch thresholds vary depending on the class and platform. Refer to the *Fabric Watch Administrator's Guide* for defaults and configuration guidelines.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command requires a Fabric Watch license.

OPERANDS

This command has the following operands:

class

Specifies a Fabric Watch class to be monitored. This operand is optional with the **--show** option; it is required with all configuration options. Valid classes include the following:

env

Monitors the environment class.

resource

Monitors the resource class.

-area area

Specifies the area that can be configured for this class. This operand is optional with the **--show** option; it is required with all configuration options. Valid areas include the following:

temp

Specifies the temperature area for the environment class. This area is valid only with the environment class.

flash

Specifies the flash memory area for the resource class. This area is valid only with the resource class.

--config class -area area

Configures Fabric Watch thresholds for monitoring a specified class and area. When configuring Fabric Watch thresholds, you must specify a class and an area.

The following operands are optional; if omitted, Fabric Watch uses default thresholds.

-highthreshold -value value

Specifies the high threshold for triggering a specified alert action. To change the default value, provide an integer *value*.

-lowthreshold -value value

Specifies the low threshold for triggering a specified alert action. To change the default value, provide an integer *value*.

-trigger above | below

Specifies the actions for in-range behavior. In range is defined as the space above the low threshold and below the high threshold for a given class and area.

-action actions

Specifies the actions triggered by a configured event condition. Valid values include one or more of the following actions. If more than one action is specified, the actions must be separated by commas.

snmp

Event triggers an SNMP trap.

raslog

Event triggers a RASlog message.

email

Event triggers an e-mail.

none

Event triggers no action.

-buffer value

Specifies the buffer value for in-range behavior. A buffer defines a zone within which event criteria are met, rather than a single threshold value. This operand is optional with the **-trigger** options and valid only with these options.

-nosave

Prevents the configuration changes from being saved persistently. This option allows you to make and view changes without overwriting the saved configuration. When you use **--config** with the **-nosave** option and the switch reboots your changes will be lost.

--apply

Applies the custom or default configuration for thresholds, actions, or both. This command allows you to choose between custom and default settings. The specified configuration takes effect upon execution of this command. When you select custom, the saved configuration becomes effective.

--cancel

Cancels a nonpersistent configurations. This command effectively undoes the **-nosave** operation without reboot.

You must always specify a class and area when you apply or cancel a configuration. Thresholds and alarm levels are optional; if omitted, all nonpersistent configurations for the specified class and area are used.

--pause | --continue arguments

Pauses or resumes monitoring. The following arguments are required:

class

Specifies the class.

-area area[,area]... | all

Specifies the area. You can either specify one or more areas separated by a comma, or you can specify all to indicate **all** areas.

-index index | all

Specifies the index number for the element to be monitored, or specify **-index all** to indicate all elements. An element is a subcomponent of an area, for example, a temperature sensor on the switch.

--show

Displays the Fabric Watch configuration for the specified class. When used without operands, this command displays the current Fabric Watch configuration for all classes and areas. When used with optional arguments, the output displays partial views or status information.

-current

Displays current values for a specified class or area. This operand is optional and valid only with the **--show** option. The output includes the class, area, port number, circuit ID (for the Brocade 7800 and FS8-24 only), Value, State, and Monitoring Status (pause or continue). The State field reports whether the current value is above, in range, or below (info) the configured threshold. If no class or area is specified, this command displays current values for all Fabric Watch classes and areas (not only those configured with this command).

The following operands are optional with the **--apply**, **--cancel**, and **--show** options; if omitted, default thresholds are used.

-action_level def | cust

Configures or displays default or custom action settings.

-thresh_level def | cust

Configures or displays default or custom thresholds.

--config mem | cpu

Configures the parameters for monitoring system CPU or memory usage. The following parameters are configurable with this command.

-poll

Specifies the polling interval in seconds. Valid values are 10 to 3600 seconds. The default value is 120 seconds. This operand is optional.

-retry

Specifies the number of retries before Fabric Watch takes action. The default value is 3.

-limit

Specifies a usage limit as percentage of available resources.

When used to configure CPU monitoring, specify a value in the 1 to 100 range. When CPU usage exceeds the limit a Fabric Watch alert is triggered. The default CPU limit 75%.

When used to configure memory monitoring the limit value must be greater than the low limit and smaller than the high limit. When the limit is exceeded, Fabric Watch sends out a RASlog WARNING message. When usage returns below the limit, Fabric Watch sends a RASlog INFO message. Valid values are in the range between the low limit and 90%. The default value is 60%.

The following operands are valid only with **--config mem**. They provide two additional limits above and below the middle usage limit.

-high_limit high_limit

Specifies an upper usage limit for memory as percentage of available memory. This value must be greater than the value set by the **-limit** parameter. The maximum is 90%. When memory usage exceeds this limit, Fabric Watch generates a CRITICAL RASlog message. The default is 80%.

-low_limit low_limit

Specifies a lower usage limit for memory as percentage of available memory. This value must be smaller than the value set by the **-limit** parameter. When memory usage exceeds or falls below this limit, Fabric Watch generates an INFO RASlog message. The default for all platforms is 50%.

-action actions

Specifies the actions to be taken if system resources exceed the specified high threshold or fall outside the boundaries defined by the high and low thresholds. Valid values are **snmp**, **raslog**, both, or **none**. The default is none. If more than one action is specified, actions must be separated by commas.

```
--show cpu | mem
```

Displays system memory or CPU usage.

--help

Displays the command usage.

EXAMPLES

To configure Fabric Watch custom thresholds for temperature:

```
switch:admin> sysmonitor --config env -area temp \
    -highthreshold -value 99 -trigger above -action raslog
```

To apply the custom thresholds for temperature:

```
switch:admin> sysMonitor --apply env -area temp \
    -action_level cust -thresh_level cust
```

To configure Fabric Watch custom thresholds for temperature using high and low thresholds and save the configuration nonpersistently:

```
switch:admin> sysmonitor --config env -area temp \
    -highthreshold -value 99 -trigger above -action email \
    -lowthreshold -value 32 -trigger below -action email
```

To apply the custom thresholds for temperature:

```
switch:admin> sysmonitor --apply env -area temp \
    -action_level cust -thresh_level cust
```

To cancel the previously configured thresholds for temperature:

```
switch:admin> sysmonitor --cancel env -area temp \
    -action_level cust -thresh_level cust
```

To display the Fabric Watch configuration for temperature:

```
switch:admin> sysmonitor --show env -area temp
Class: ENV
  Area
          : TEMP
  ThLevel : Def
  ActLevel: Def
  High
        Custom:
              TimeBase: None
              Value : 65
              Trigger : Above Action: Raslog, SNMP
              Trigger : Below Action: Raslog, SNMP
        Default:
              TimeBase: None
              Value : 65
              Trigger : Above Action: Raslog, SNMP
              Trigger : Below Action: Raslog, SNMP
   Low:
        Custom:
              TimeBase: None
              Value : 0
              Trigger : Above Action: None
              Trigger : Below Action: Raslog, SNMP
        Default:
              TimeBase: None
              Value : 0
              Trigger : Above Action: None
              Trigger : Below Action: Raslog, SNMP
```

```
Buffer:
     Custom:
          Value : 10
     Default:
           Value : 10
```

To display current temperature values:

```
switch:admin> sysmonitor --show env -area temp -c
Class | Area | Index | Value | State | Monitoring
-----|----|-----|-----|
ENV | TEMP | 000001 | 39 | InRange | Continue
            000002|35
ENV
     TEMP
                         |InRange|Continue
            000003 42
                         | InRange | Continue
ENV
     TEMP
ENV
     TEMP
           000004|44
                         | InRange | Pause
```

To configure Fabric Watch custom thresholds for flash memory:

```
switch:admin> sysmonitor --config resource -area flash \
     -highthreshold -value 100
```

To apply the custom thresholds for flash memory:

```
switch:admin> sysmonitor --apply resource -area \
    flash -thresh_level cust
```

To display the Fabric Watch configuration for flash memory:

```
switch:admin> sysmonitor --show resource
Class: RESOURCE
   Area : FLASH
  ThLevel : Cust
  ActLevel: Cust
  High :
       Custom:
             TimeBase: None
             Value : 100
             Trigger : Above Action: Raslog, SNMP
             Trigger : Below Action: Raslog
       Default:
             TimeBase: None
             Value : 90
             Trigger : Above Action: Raslog, SNMP
             Trigger : Below Action: Raslog
  Low:
       Custom:
             TimeBase: None
             Value : 0
             Trigger : Above Action: None
             Trigger : Below Action: Raslog, SNMP
       Default:
             TimeBase: None
             Value : 0
             Trigger : Above Action: None
             Trigger : Below Action: Raslog, SNMP
   Buffer:
       Custom:
             Value : 0
       Default:
             Value : 0
```

To pause monitoring of the resources class for a single element:

```
switch:admin> sysmonitor --pause resource -area all -index 0 switch:admin> sysmonitor --show resource -current

Class | Area | Index | Value | State | Monitoring | Current | Class | Area | Index | Value | Index | Index | Value | State | Monitoring | Current | Class | Area | Index | Value | Index | Value | Pause | Class | Index | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Value | Class | Val
```

To continue monitoring of the resources class:

```
switch:admin> sysmonitor --continue resource -area all -index 0 switch:admin> sysmonitor --show resource -current

Class | Area | Index | Value | State | Monitoring | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue | Continue
```

To configure the thresholds for memory usage monitoring:

```
switch:admin> sysmonitor --config mem -poll 10 -retry 3 \
    -limit 60 -action snmp,raslog \
    -high_limit 70 -low_limit -40
```

To display the current memory usage and configuration:

```
switch:admin> sysmonitor --show mem

Showing Memory Usage:

Used Memory : 192020k 25%

Total Memory : 768080k

Free Memory : 576060k

Used Memory Limit : 60%

Low Used Memory Limit : 40%

High Used Memory Limit: 70%

Polling Interval : 60 seconds

No Of Retries : 3

Actions : none
```

To configure the threshold for monitoring system CPU usage:

```
switch:admin> sysmonitor --config cpu -poll 20 -retry 4 \
    -limit 70 -action snmp
```

To display the current memory usage threshold:

```
switch:admin> sysmonitor --show cpu
Showing Cpu Usage:
    Cpu Usage : 21.9%
    Cpu Usage limit : 75%
    Number of Retries : 4
    Polling Interval : 120 seconds
    Actions : none
```

sysShutDown

Provides a graceful shutdown to protect the switch file systems.

SYNOPSIS sysshutdown

DESCRIPTION

On standalone platforms, use this command to shut down the switch operating system.

On enterprise-class platforms, when **sysShutDown** is called on the active control processor (CP), the command shuts down the active CP, standby CP, and any AP blades.

Some platforms will only shut down the operating systems; others will shut down the operating system as well as shut off the power, that is, the LEDs will turn black.

After executing this command, manually power off the system. To reboot the system, manually turn the power switch on.

NOTES

This command is not supported on the standby CP.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES

To perform a system shutdown on a standalone platform:

```
switch:admin> sysshutdown
This command will shutdown the operating systems on your
switch. You are required to power-cycle the switch in
order to restore operation.
Are you sure you want to shutdown the switch [y/n]? y
Broadcast message from root (ttyS0) Mon Sep 12 17: \
52:12 2005...
The system is going down for system halt NOW !!
INIT: Switching to runlevel:
INIT: Sending processes the TERM signal
ess095:root> Unmounting all filesystems.
The system is halted
flushing ide devices: hda
Power down.
```

To perform a system shutdown on a Brocade DCX-4S:

```
switch:admin> sysshutdown
This command will shutdown the operating systems on your
switch. You are required to power-cycle the switch in
order to restore operation.
Are you sure you want to shutdown the switch [y/n]?y
HA is disabled
Shutting down blade in slot:1, IP addr:127.1.14.2
Shutting down blade in slot:8, IP addr:127.1.14.9
Shutting down OCP at:0.0.0.0
Broadcast message from root (pts/0) Wed Nov 5 19:03:06 2008...
The system is going down for system halt NOW !!
```

To attempt a system shutdown from the standby CP (not supported):

switch:admin> sysshutdown
Shut down the whole system is not support from the standby CP
For shut down the whole system
please run the sysshutdown from the active CP

SEE ALSO haDisable

tempShow

Displays temperature readings.

SYNOPSIS

tempshow

DESCRIPTION

Use this command to display the current temperature readings of all temperature sensors in a switch. For each sensor, this command displays the sensor ID (an index number), the slot number (if applicable), the sensor state (OK or absent), and the temperature. The temperature readings are given in both Centigrade and Fahrenheit.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

Refer to the hardware reference manual for your switch to determine the normal temperature range.

OPERANDS

None

EXAMPLES

To display temperature and status sensors:

switch:user>		tempshow		
Sensor	Slot	State	Centigrade	Fahrenheit
ID				
======	=====			=======
1	1	Ok	38	100
2	1	Ok	28	82
3	1	Ok	40	104
4	1	Ok	31	87
5	1	Ok	43	109
6	2	Ok	39	102
7	2	Ok	28	82
8	2	Ok	40	104
9	2	Ok	30	86
10	2	Ok	43	109

thConfig

Configures Fabric Watch thresholds for the SFP, fabric, filter, security and EE monitor classes.

SYNOPSIS

```
thconfig --set class -area area
   [-timebase time base
   [-sfptype sfp_type]
   [-highth -value value
   -trigger above | below -action actions]
   [-lowth -value value
   -trigger below -action actions]
   [-buffer value][-nosave]
thconfig --apply class -area area
   [-sfptype sfp_type]
   [-thresh_level def | cust][-action_level def| cust]
thconfig --cancel class -area area
   [-sfptype sfp type]
   [-thresh level def | cust][-action level def| cust]
thconfig --show [class] [-area area]
   [-sfptype sfp_type] [[-current] |
   [-thresh_level def | cust] [-action_level def | cust]]
thconfig --show [class] [-area_only]
thconfig --pause | --continue class
   [-area area[,area,...] | all]
   [-port port list | all] |
   [-index index | all]
thconfig --help
```

DESCRIPTION

Use this command to configure thresholds for Fabric Watch event monitoring for the SFP (small form-factor pluggable),fabric, filter, end-to-end performance monitor, and security classes or to display the configuration. If configured areas exceed the currently effective threshold settings, the Fabric Watch daemon can take one or more of the following actions:

- Send an SNMP message.
- Log a RASlog message.
- Send an E-mail alert.
- Locks the port log (only applicable to SFP state change area and FABRIC class).

The **thConfig** command follows a transaction model. When you configure thresholds and actions with the **--set** option, the changes are saved persistently to nonvolatile storage, but the changes do not become effective until you apply the configuration. The **--apply** option allows you to toggle between default settings and your own saved custom configuration and to apply actions and thresholds separately. You may choose to use default thresholds together with a customized subset of available actions, or you may modify some of the thresholds and use the default actions. Use the **-nosave** option to save the configuration nonpersistently, and use **--cancel** to remove a nonpersistent configuration.

For more information on Fabric Watch threshold configuration procedures, including default values for specific area high/low thresholds, refer to the *Fabric Watch Administrator's Guide*.

NOTES

Monitoring of Condor 3-based 10G SFPs, 16G SFPs, and 16G QSFPs (quad small form-factor pluggables) is by default disabled. Use the thMonitor command to enable monitoring of these advanced SFPs.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

The Fabric and Security classes are not supported in Access Gateway mode.

OPERANDS

This command has the following operands:

class

Specifies a Fabric Watch class to be monitored. This operand is optional with the --show option and required with all configuration options.

-area area

Specifies the area that can be configured for a specified class. This operand is optional with the --show option and required with all configuration options. Areas are specific to each class. The following classes and associated areas are configurable with the thConfig command. Classes and areas are not case sensitive.

SFP

Monitors the SFP class. When used with the -sfptype option on Condor 3-based platforms, thresholds configured for the SFP class apply to 16G SFPs, 10G SFPs, and 16G QSFPs. Valid areas for the SFP class include the following:

TEMP

Monitors the physical temperature of the SFP in degrees Celsius. For 16G QSFPs, Fabric Watch monitors temperature only on the first QSFP port that is available on the (logical) switch.

RXP

Measures Receive Power for the SPF in Watts.

TXP

Measures Transmit Power for the SPF in Watts (not supported on 16G QSFPs).

CURRENT

Measures the amount of current supplied to the SFP transceiver.

VOLTAGE

Measures the amount of voltage supplied to the SFP. For 16G QSFPs, Fabric Watch monitors voltage only on the first QSFP port that is available on the (logical) switch.

ST

Measures the number of SFP state changes This area is deprecated as of Fabric OS v7.0. To configure SFP State Changes, use the fwFruCfg command.

PWRONHRS

Measures the number of operational hours (power-on hours) for the SFP. This class is supported only for 16G SFPs and QSFPs (Condor 3 ASIC), and the only valid time base for this class is **none**. You can display the power-on hours with the sfpShow command.

FABRIC

Monitors the Fabric class. Valid areas for the Fabric class include the following:

ED

Tracks the number of times an E_Port or VE_Port goes down.

FC	Tracks the number of times the fabric reconfigures.				
DC					
SC	Tracks the number of Domain ID changes.				
ZC	Tracks the number of segmentation changes.				
	Tracks the number of zoning conflicts.				
FL	Tracks the number of fabric logins.				
SECURITY	Monitors the Security class. Valid areas for the security class include the following:				
TV					
HV	Tracks the number of Telnet violations.				
SV	Tracks the number of HTTP violations.				
	Tracks the number of switch connection control (SCC) policy violations.				
DV	Tracks the number of device connection control (DCC) policy violations.				
LV	Tracks the number of login violations.				
IC	Tracks the number of invalid certificates.				
TS	Tracks the number of invalid certificates.				
FF	Tracks the number of times the time server is out of sync.				
	Tracks the number of Fibre Channel link access protocol (FLAP) violations.				
NF	Tracks the number of times the switch has lost contact with the primary FCS.				
ISB	Tracks the number of times the switch encounters an incompatible security database				
IV	Tracks the number of times a command permitted only on the primary Eibra				
	Tracks the number of times a command permitted only on the primary Fibre Channel Switch (FCS) is executed on another switch.				
FILTER	Monitors the Filter Performance Monitor class. Valid areas for the filter class include the following:				
PERFPT	Customer defined performance areas. You can specify any filter monitor to be tracked by Fabric Watch. Refer to the fmMonitor command for more information.				

EE

Monitors the End-to-End Performance Monitor class. Valid areas for the EE class include the following:

RXP

Monitors receive performance as the percentage of word frames traveling

from the configured SID to the DID.

TXP

Monitors transmit performance as the percentage of word frames traveling from the configured DID to the SID.

--set class -area area

Configures Fabric Watch thresholds for monitoring a specified class and area. When configuring Fabric Watch thresholds, you must specify a class and an area.

The following operands are optional and valid only with the --set option; if omitted, the default Fabric Watch configuration is used. Default parameters vary depending on the area and platform. Refer to the Fabric Watch Administrator's Guide for specific details.

-timebase time_base

Specifies the time interval between two samples to be compared. Valid intervals include the following:

day

Samples are compared once a day.

hour

Samples are compared once every hour.

minute

Samples are compared once every minute.

none

Samples are not compared.

-sfptype sfp_type

Configures and manages thresholds and alerts for 10G SFPs, 16G SFPs and 16G QSFPs. Fabric Watch applies thresholds based on the serial numbers of the SFP types. If the SFP serial number cannot be determined, Fabric Watch applies pre-Fabric OS v7.0.0 thresholds. This operand is optional and supported only on Condor 3-based platforms; if omitted, legacy thresholds and actions apply to 8G SPPs. Valid SFP types include the following:

16GSWL

Brocade-branded 16G SFP with serial number HA.

16GLWL

Brocade-branded 16G SFP with serial number HD.

QSFP

Brocade-branded 16G QSFP.

10GSWL

Brocade-branded 10G SFP with serial number KA.

10GLWL

Brocade-branded 10G SFP with serial number KD.

-highth -value value

Specifies the high threshold value for triggering a specified alert action. To change the default value, provide an integer value.

-lowth -value value

Specifies the low threshold for triggering a specified alert action. To change the default value, provide an integer *value*.

-trigger above | below

Specifies the actions for in range behavior. In range is defined as the space above the low threshold and below the high threshold. The **below** operand is not supported with the **-sfptype** option.

-action actions

Specifies the actions triggered by a configured event condition. Valid values include one or more of the following actions. If more than one action is specified, the actions must be separated by commas.

raslog

Event triggers a RASlog message.

snmp

Event triggers an SNMP trap.

email

Event triggers an e-mail.

portlog

Locks the port log (only applicable to SFP state change area and FABRIC class). Following an event, the port log locks to retain information about an event, preventing the information from being overwritten as the log becomes full.

none

Event triggers no action.

-buffer value

Specifies the buffer value for in range behavior. A buffer defines a zone within which event criteria are met, rather than a single threshold value. This operand is valid only with the **-trigger** options.

-nosave

Prevents the configuration changes from being saved persistently. This option allows you to make and view changes without overwriting the saved configuration. When you use **--set** with the**-nosave** option and the switch reboots your changes will be lost.

--apply

Applies the custom or default configuration for thresholds, actions, or both. This command allows you to toggle between custom and default settings. The specified configuration takes effect upon execution of this command. When you select custom, the saved configuration becomes effective. You must specify a class and an area when applying a configuration.

--cancel

Cancels a nonpersistent custom configuration. This command effectively undoes the **-nosave** operation without reboot. You must specify a class and an area with this command. Thresholds and alarm levels are optional; if omitted, all nonpersistent configurations for the specified class and area are canceled.

--show

Displays the threshold configuration or run-time status for all configured classes and areas. You can optionally specify a class to display the threshold for all areas in that class. Or you can specify an a class and an area to display the area-specific configuration only. When issued without operands, this command displays all configured thresholds for all Fabric Watch classes. When issued with the **-sfptype** option on Condor 3 -based platforms, this command displays an additional column with SFP type.

The following operands are optional and valid only with the **--show** option.

-current

Displays current values for a specified class and area, as registered by Fabric Watch, or for all port types and areas. The output includes the class, area, port number, circuit number if applicable, current value, Fabric Watch State, and Monitoring State (pause or continue). The SFP type is displayed for the SFP class. The State field reports whether the current value is above, in range, or below (info) the configured threshold.

-area_only

Displays areas of a specified class (Valid for FILTER class only).

The following operands are optional with the --apply, --cancel, and --show options; if omitted, defaults are used.

-thresh_level def | cust

Configures or displays default or custom threshold configuration settings.

-action_level def | cust

Configures or displays default or custom configuration settings.

--pause | --continue arguments

Pauses or resumes monitoring. The following arguments are required:

class

Specifies the class.

-area area[,area]... | all

Specifies the area. You can either specify one or more areas separated by a comma, or you can specify all to indicate all areas.

-port port_list |all

Specifies one or more ports or all ports. The port_list operand supports one of the following values:

- A single port number preceded by the slot number on bladed systems.
- A set of comma-separated port numbers, preceded by the slot number on bladed systems, for example, 3,8,15, or 1/1,1/9,2/27.
- A port range, for example 3-24 or 1/1-1/9. A port range cannot span slots. port ranges are supported only with the SFP, FILTER, and EE classes.

-index index |all

Specifies the index number for areas in the FABRIC and SECURITY classes (supported only with the FABRIC and SECURITY classes).

--help

Displays the command usage.

EXAMPLES

To set custom thresholds for the SFP class and temperature area for a 16G QSFP on a DC X8510-8:

```
switch:admin> thconfig --set sfp -area temp -sfptype qsfp \
     -highth -value 32 -trigger above -action email
switch:admin> thconfig --set sfp -area temp -sfptype qsfp\
   lowth -value 0 -trigger above -action raslog
```

To apply the new custom settings so they become effective:

```
switch:admin> thconfig --apply sfp -area temp -sfptype qsfp \
     -action cust -thresh_level cust
```

To set high thresholds for the security class and login violation area with SNMP alerts and save the thresholds nonpersistently:

```
switch:admin> thconfig --set security -area lv \
    -highth-value 0 -trigger above \
    -action snmp -nosave

switch:admin> thconfig --set security -area lv \
    -highth -value 0 -trigger below \ \
    -action none -nosave
```

To cancel the custom settings that have previously been saved nonpersistently.

To display the Fabric Watch configuration for the QSFP temperature on a DCX 8510-8:

```
switch:admin> thconfig --show sfp -area temp -sfptype qsfp
Class: SFP
SFP TYPE: QSFP
       Area
               : TEMP
       ThLevel : Def
       ActLevel: Def
       High
               Custom:
                       TimeBase: None
                       Value : 85
                       Trigger : Above Action: Raslog
                       Trigger : Below Action: Raslog
                Default:
                       TimeBase: None
                       Value : 85
                       Trigger : Above Action: Raslog
                       Trigger : Below Action: Raslog
       Low:
               Custom:
                       TimeBase: None
                       Value : -5
                       Trigger : Below Action: Raslog
                Default:
                       TimeBase: None
                       Value : -5
                       Trigger : Below Action: Raslog
       Buffer:
                Custom:
                       Value
                               : 0
                Default:
                       Value
                              : 0
```

To display only the custom thresholds for the QSFP temperature:

```
switch:admin> thconfig --show sfp -area temp \
    -sfptype qsfp -thresh_level cust

Class: SFP
SFP TYPE: QSFP
    Area : TEMP
    ThLevel : Def
    ActLevel: Def
    High :
```

Custom: TimeBase: None Value : 85 Trigger : Above Action: Raslog Trigger : Below Action: Raslog Low: Custom: TimeBase: None Value : -5 Trigger : Below Action: Raslog Buffer: Custom: Value : 0

To pause and then resume monitoring of the SFP area:

```
switch:admin> thconfig --pause SFP -area all -port all
switch:admin> thconfig --continue SFP -area all -port all
```

To display the monitoring status for the QSFPs:

switch:adr	min> th o	config -	show sfp	-sfptype qsfp -c		
Class	Area	Index	Value	State	Monitoring	SfpType
SFP	TEMP	000385	0	Info	Continue	QSFP

SEE ALSO fwHelp, portFencing, portThConfig, sfpShow, sysMonitor, thMonitor

thMonitor

Enables monitoring of small form-factor pluggables (SFPs).

SYNOPSIS thmonitor -- enable brcdsfp

thmonitor --disable brcdsfp

thmonitor --show

DESCRIPTION

Use this command to enable Fabric Watch threshold monitoring for 10G and 16G SFPs and for 16G QSFPs. Fabric Watch does not monitor 10G and 16G SFPs or 16G QSFPs unless monitoring is explicitly enabled with this command.

NOTES

This command requires a Fabric Watch license.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--enable brcdsfp

Enables Fabric Watch threshold monitoring for 10G and 16G SFPs and for 16G

QSFPs. The feature is by default disabled.

--disable brcdsfp

Disables Fabric Watch threshold monitoring for 10G and 16G SFPs and for 16G

QSFPs.

--show

Displays the current configuration.

--help

Displays the command usage.

EXAMPLES

To enable Fabric Watch threshold monitoring for 10G and 16G SFPs and for 16G QSFPs.

```
switch:admin> thmonitor --enable brcdsfp
Brcd SFP Threshold Monitoring is enabled
```

To display the configuration:

```
switch:admin> thmonitor --show
Brcd SFP Threshold Monitoring is enabled
```

To disable Fabric Watch threshold monitoring for 10G and 16G FPs and for 16G QSFPs.

```
switch:admin> thmonitor --disable brcdsfp
Brcd SFP Threshold Monitoring is disabled
```

SEE ALSO thConfig, sfpShow

timeOut

Sets or displays the idle timeout value for a login session.

SYNOPSIS timeout [timeval]

DESCRIPTION

Use this command without an operand to display the current timeout value (in minutes) after which idle logins are automatically terminated.

Use this command with the timeval operand to set the login timeout value to the specified interval. A value of 0 disables timeout of login sessions.

The new timeout value takes effect with the next logins.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

timeval

Specify the number of minutes for the Telnet timeout value. Valid values are 1 to 99,999, or 0 to disable login timeouts. This operand is optional; if omitted, the command displays the current timeout value.

EXAMPLES

To set the idle timeout to 10 minutes:

switch:admin> timeout 10

IDLE Timeout Changed to 10 minutes

The modified IDLE Timeout will be in effect after NEXT login

SEE ALSO None

topologyShow

Displays the unicast fabric topology.

SYNOPSIS

topologyshow [domain]

DESCRIPTION

Use this command to display the fabric topology as it appears to the local switch. The display varies depending on the hardware configuration. The following rules apply:

- On all switches, the command displays the number of domains in the fabric and the local Domain IDs. If translate domains are configured, existing translate domains and associated ports are displayed.
- On an edge fabric, the command displays the following additional details for all domains in the fabric (including local translate domains):
 - All possible paths from the local switch to each of the remote domains.
 - For each path, the cost, the associated output port on the local switch, the path cost, and the number of hops from the local switch to the destination switch.
 - A summary of all ports that are routed through that path.
- On a backbone fabric, the command displays details for remote domains only. Details for local translate domains are not displayed.
- If there are two switches in the Backbone and the edge fabric is directly connected to both of those switches, topologyshow does not display the description of the translate domain associated with that edge fabric. In this case the translate domain is considered local to both of the switches in the backbone.
- If there is only one switch in the backbone, no domain details are displayed (all domains are local). Depending on the fabric, the display may contains the following fields:

Local Domain ID

The domain number of local switch.

Local Translate Domain x owned by port

The port number associated with the local translate domain x.

Domain

The domain number of destination switch.

Metric

The cost of reaching destination domain.

Name

The name of the destination switch.

Path Count

The number of currently active paths to the destination domain.

Hops

The maximum number of hops to reach destination domain.

Out Port

The port to which incoming frames are forwarded to reach the destination domain.

In Ports

The input ports that use the corresponding out port to reach the destination domain. This is the same information provided by **portRouteShow** and **uRouteShow** but in a different format.

Total Bandwidth

The maximum bandwidth of the out port. A bandwidth that is less than 0.512 Gbps is adjusted to the nearest power of 2 value. A bandwidth in the range of 0.512 Gbps (included) to 1 Gbps (not included) is adjusted to the 0.512 Gbps value. No adjustment takes place if the bandwidth is greater or equal to 1 Gbps.

Bandwidth Demand

The maximum bandwidth demand by the in ports.

Flags

Always D, indicating a dynamic path. A dynamic path is discovered automatically by the FSPF path selection protocol.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operand is optional:

domain

Specify the destination domain for which to display the topology information.

EXAMPLES

To display the topology on a single switch: domain is local, details are not displayed.

```
switch:user> topologyshow

1 domains in the fabric; Local Domain ID: 97
```

When executed from an edge fabric, **topologyshow** displays details for all domains, including local domains and local translate domains:

```
switch:user> topologyshow
6 domains in the fabric; Local Domain ID: 7
Domain:
               1

SEE ALSO fcrXlateConfig, portRouteShow, uRouteShow

traceDump

Initiates, or removes a trace dump or displays the trace dump status.

SYNOPSIS

tracedump [-S]

tracedump -n [-s slot]

tracedump -r [-s slot] | -R

tracedump -c [-s s/of]

DESCRIPTION

Use this command to initiate a background trace dump, to remove the content of a trace dump, or to display the dump status on the switch.

When executed without operands, this command defaults to traceDump -S.

Execution of traceDump -n generates a local trace dump locally. Use supportSave to transfer the local trace dump to a remote host. When supportSave is used, the default remote file name format for the trace dump file is as follows:

chassisname-S#xxs-YYYYMMDDHHMMSS.type_[new | old].dmp.gz

S#

Indicates the slot number (0 on standalone platforms)

xxs

Indicates the processor. Values are cp0, cp1, bp0, bp1, dp0, or dp1.

YYYYMMDDHHMMSS

Indicates the trace dump time stamp (year-month-day-hour-minute-second).

type

Indicates the tracedump type. Valid types include BTRACE, DTRACE, and

CTRACE.

new | old

Indicates a new or an old trace dump file.

dmp.gz

The compressed trace dump archive file extension.

For example, the filename for a a new BFOS tracedump received from slot 10 on chassisABC would be chassisABC-S10bp-201103031111.BTRACE_NEW.dmp.gz.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following mutually exclusive operands:

-S

Displays the trace dump status This operand is optional. If omitted, the same

status information is displayed.

-n

Initiates a background trace dump.

Clears the status of a particular trace dump on a specified slot.

-R

Clears the status of a particular trace dump on all slots.

-c

Clears all trace dump buffers. This operation resets the trace buffer contents.

-s slot

Specifies the slot number from which a trace dump is generated. If a slot is not supplied, the trace dump is generated from the local slot. This operand is optional.

EXAMPLES

To initiate a background trace dump from slot 5:

```
switch:admin> tracedump -n -s 5
```

To clear the status of a trace dump:

```
switch:admin> tracedump -R
trace dump removed
```

To clear the content of the trace dump buffer:

```
switch:admin> tracedump -c
Cleared Trace Buffer contents
```

SEE ALSO

supportFtp, supportSave, supportShow

trackChangesHelp

Displays commands for the track-changes feature.

SYNOPSIS trackchangeshelp

DESCRIPTION Use this command to display a list of commands available for the track-changes feature.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the track-changes command help information:

switch:admin> trackchangeshelp

Print track-changes help info trackchangeshelp trackchangesset Configure track-changes modes trackchangesshow Displays status of track-changes

SEE ALSO trackChangesSet, trackChangesShow

trackChangesSet

Configures the track-changes feature.

SYNOPSIS

trackchangesset [mode][,snmptrapmode]

DESCRIPTION

Use this command to enable or disable the track-changes feature and to configure the SNMP-TRAP mode. When enabled, this command tracks the following changes:

- Successful login
- Unsuccessful login
- Logout
- Enabling or disabling of the track-changes feature

The output from the track-changes feature is dumped to the switch error log. Use **errDump** or **errShow** to view the error log.

When used without operand, this command displays the usage.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

mode

Specify 1 to enable the track-changes feature or specify 0 to disable the feature. Track-changes is disabled by default.

snmptrapmode

Specify 1 to enable sending messages to the SNMP-TRAP in addition to the error log. Specify 0 to disable the SNMP-TRAP messages. The SNMP-TRAP mode is disabled by default. This operand is optional; if omitted, this command disables the SNMP-TRAP mode.

EXAMPLES

To enable the track-changes feature:

```
switch:admin> trackchangesset 1,1
Committing configuration...done.
```

To display the configuration:

```
switch:admin> trackchangesshow
Track changes status: ON
Track changes generate SNMP-TRAP: YES
```

SEE ALSO

trackChangesHelp, trackChangesShow

trackChangesShow

Displays the track-changes configuration.

SYNOPSIS trackchangesshow

DESCRIPTION Use this command to display the configuration of the track-changes feature. The output indicates

whether the feature is enabled or disabled, and whether SNMP traps are generated.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display the track-changes configuration:

switch:admin> trackchangesshow

Track changes status: ON

Track changes generate SNMP-TRAP: YES

SEE ALSO trackChangesHelp, trackChangesSet

trunkDebug

Debugs a trunk link failure.

SYNOPSIS

trunkdebug port1 port2

DESCRIPTION

Use this command to debug a trunk link failure. This command reports one of the following messages, based on the trunking properties of the two specified ports:

- Switch does not support trunking
- Trunking license required
- port port_id is not E_Port
- port port_id trunking disabled
- port port_id speed is not 2G, 4G or 8G
- port port_id and port port_id are not in same port group
- port port_id and port port_id connect to different switches
- port port_id and port port_id connect to the switch WWN
- port port_id is not a trunking port due to: E_Port being disabled, or trunking might be disabled at remote port
- port port_id and port port_id cannot trunk, please check link length to make sure difference is less than 400 m

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

port1

Specify the port index number of port 1. Use the **switchShow** command to view the index numbers for a port. This operand is required.

port2

Specify the port index number of port 2. Use the **switchShow** command to view the index numbers for a port. This operand is required.

EXAMPLES

To debug a trunk connection:

```
switch:admin> trunkdebug 43 44
Switch does not support trunking
switch:admin> trunkdebug 62 63
port 62 and 63 are trunked together
```

SEE ALSO

portCfgTrunkPort, switchCfgTrunk, trunkShow

trunkShow

Displays trunking information.

SYNOPSIS

trunkshow [-perf]

DESCRIPTION

Use this command to display trunking information of both E_Ports and EX_Ports. The command displays the following fields:

Trunking Group Number

Displays each trunking group on a switch. All ports that are part of this trunking group are displayed.

Port to port connections

Displays the port-to-port trunking connections.

WWN

Displays the world wide name of the connected port.

Domain

Displays the domain IDs of the switches directly connected to the physical ports. In case of an FC Router backbone fabric interlinking several edge fabrics, the domain ID displayed for an E_Port trunk refers to a domain of a switch within the backbone fabric, whereas the domain ID displayed for an EX Port trunk refers to the domain ID of a switch in the edge fabric. Because they are independent fabrics, it is possible that both the backbone and the edge fabric may have the same domain ID assigned to switches. If this is the case, run switchShow to obtain information on the port types of the local switch and the WWNs of the remote switches. Refer to the Example section for an illustration.

deskew

The difference between the time it takes for traffic to travel over each ISL compared to the time it takes through the shortest ISL in the group plus the minimum deskew value. The value is expressed in nanoseconds divided by 10. The firmware automatically sets the minimum deskew value for the shortest ISL, which is 15.

Master

Displays whether this trunking port connection is the master port connection for the trunking group.

When used with the **-perf** option, the command output displays the following additional information:

bandwidth

The bandwidth (Rx, Tx, and the combined total for Tx+Rx) of the trunk group. Values are displayed as either bits per second (Bps), kilobits per second (Kbps), megabits per second (Mbps), or gigabits per second (Gbps), rounded down to the next integer.

throughput

Displays the throughput (Rx, Tx, and the combined total for Tx+Rx) of the trunk group. Results are displayed for the previous second. Values are displayed as either bits per second (Bps), kilobits per second (Kbps), megabits per second (Mbps), or gigabits per second (Gbps), rounded down to the next integer.

%

Displays the percentage of link utilization (Rx, Tx, and the combined total for Tx+Rx). Even when the link utilization is 100%, the throughput value will be lesser than the bandwidth value, due to the 8b/10b encoding and the control words transmitted. For example, the throughput for an 8Gbps link at 100% utilization would be approximately 6.8Gbps.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

-perf

Displays the total bandwidth, throughput, and percentage of link utilization information for the trunk group (Rx, Tx, and combined total for Tx+Rx). This operand is optional.

EXAMPLES

To display trunking information for a switch:

```
switch:admin> trunkshow
1: 43-> 0 10:00:00:05:1e:53:e3:8a 92 deskew 15 MASTER
2: 58-> 66 10:00:00:05:1e:4f:eb:00 65 deskew 16 MASTER
61-> 69 10:00:00:05:1e:4f:eb:00 65 deskew 16 57-> 65 10:00:00:05:1e:4f:eb:00 65 deskew 16 60-> 68 10:00:00:05:1e:4f:eb:00 65 deskew 15 56-> 64 10:00:00:05:1e:4f:eb:00 65 deskew 16 63-> 71 10:00:00:05:1e:4f:eb:00 65 deskew 16 62-> 70 10:00:00:05:1e:4f:eb:00 65 deskew 16 3: 59-> 67 10:00:00:05:1e:4f:eb:00 65 deskew 16
```

To display trunking information for a switch that is part of an FC Router backbone fabric interlinking several edge fabrics (see the EX_Port with WWN "10:00:00:05:1e:35:b3:03" and the E_Port with WWN "10:00:00:05:1e:37:12:13" in the output below):

```
switch:admin> trunkshow
4: 49-> 0 10:00:00:05:1e:35:b3:03
                                   4 deskew 16 MASTER
  54-> 2 10:00:00:05:1e:35:b3:03 4 deskew 16
  53-> 5 10:00:00:05:1e:35:b3:03 4 deskew 16
  50-> 6 10:00:00:05:1e:35:b3:03 4 deskew 15
  51-> 4 10:00:00:05:1e:35:b3:03
                                  4 deskew 16
  52-> 7 10:00:00:05:1e:35:b3:03
                                  4 deskew 67
  55-> 3 10:00:00:05:1e:35:b3:03
                                  4 deskew 16
  48-> 1 10:00:00:05:1e:35:b3:03
                                  4 deskew 15
5: 71-> 22 10:00:00:05:1e:37:12:13
                                  4 deskew 17 MASTER
  67-> 17 10:00:00:05:1e:37:12:13
                                  4 deskew 16
  70-> 20 10:00:00:05:1e:37:12:13
                                 4 deskew 16
  69-> 21 10:00:00:05:1e:37:12:13
                                  4 deskew 16
  66-> 18 10:00:00:05:1e:37:12:13
                                  4 deskew 17
  68-> 23 10:00:00:05:1e:37:12:13
                                  4 deskew 17
  64-> 16 10:00:00:05:1e:37:12:13
                                  4 deskew 15
  65-> 19 10:00:00:05:1e:37:12:13
                                   4 deskew 16

tsClockServer

Displays or sets the Network Time Protocol (NTP) Server addresses.

SYNOPSIS

tsclockserver [ipaddr [; ipaddr ...]]

DESCRIPTION

Use this command to synchronize the local time of the Principal or Primary FCS switch to one or more external NTP servers.

This command accepts a list of NTP server addresses. The NTP server addresses can be passed in either IPV4 or IPV6 address format or as a DNS server name. When multiple NTP server addresses are specified, **tsClockServer** sets the first reachable address for the active NTP server. The remaining addresses are stored as backup servers, which can take over if the active NTP server fails.

The time server daemon synchronizes fabric time by sending updates of the Principal or Primary FCS local switch time periodically to every switch in the fabric. The time server daemon runs on all switches in the fabric, but only the Principal switch (when an FCS policy is not enabled) or the Primary FCS switch (when an FCS policy is enabled) connect to the NTP server (if specified) and broadcasts time service updates.

All switches in the fabric maintain the current clock server IP address in nonvolatile memory. By default, this value is **LOCL**., that is, the local clock of the Principal or the Primary FCS switch is the default clock server. Changes to the clock server IP addresses on the Principal or Primary FCS switch are propagated to all switches in the fabric.

Use this command without parameters to display the active NTP server and the configured NTP server list. Specify the **ipaddr** operands to set the clock server IP addresses and enable fabric-wide clock synchronization with the specified clock server. A value of **LOCL** may be specified as operand to set the clock server back to default.

Each **ipaddr** specified should be the IP address of an NTP server and should be accessible from the switch. The NTP server must support a full NTP client. When a clock server IP address other than **LOCL** is specified but is not used by the fabric, a warning is displayed and logged. When a clock server IP address other than **LOCL** is specified, the **date** command is restricted to display only. Refer to the **date** command help for details.

NOTES

When an FCS policy is enabled, this command can be run on all switches to view the clock server value. However, you can only modify the clock server value from the Primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

ipaddr

Specify the IP address of the NTP server or **LOCL** to use the local clock of the Principal or Primary FCS switch as the clock server. If more than one IP address is specified, separate the IP addresses by semicolons and enclose the list in double quotation marks. This operand is optional; if omitted, the current NTP server configuration is displayed. The default NTP server is **LOCL**.

EXAMPLES

To display the default clock server:

switch:admin> tsclockserver
LOCL

To set the NTP server to a specified IP address:

```
switch:admin> tsclockserver 123.123.123.123
Updating Clock Server configuration...done.
switch:admin> tsclockserver
123.123.123.123
```

To configure multiple NTP servers:

```
switch:admin> tsclockserver "12.134.125.24; 12.234.87.01"
Updating Clock Server configuration...done.
```

SEE ALSO date

tsTimeZone

Displays or sets the system time zone.

SYNOPSIS t

tstimezone --interactive

tstimezone timezonename

tstimezone --old hourOffset[,minuteOffset]

DESCRIPTION

Use this command to display or set the system time zone.

All switches maintain the current time zone setup in nonvolatile memory. Changing the time zone on a switch updates the local time zone setup and is reflected in local time calculations.

All switches are by default in the 0,0 time zone:, which is, GMT. If all switches in a fabric are located in the same time zone, you may leave the default time zone setup.

Time zone is used in computing local time for error reporting and logging. An incorrect time zone setup does not affect the switch operation in any way.

System services started during the switch boot reflect a time zone change only at the next reboot.

The time zone can be specified in the following two ways, by name or in an hours and minutes offset format:

- The offset format is specified with the --old option, followed by an hour offset value and optionally a
 minute offset value.
- The time zone name format uses the timezone database, which automatically adjusts for Daylight Saving Time.

By default, the switch is in offset mode (**--old**), with zero offsets, that is, time is displayed in GMT. Use **tsTimeZone** *timezonename* to change the offset format to the timezone name format.

When executed without parameters, this command displays the current time zone configuration in the format in which it was set.

- Negative hour offset values mean that the local time is behind GMT; for example, -8,0 is GMT-08:00.
- Positive hour offset values mean the that local time is ahead of GMT; for example, 3,0 is GMT+03:00.

When Virtual Fabrics are enabled, the hardware clock is updated by the default switch in the chassis, and the time zone set on any logical switch applies to all logical switches on the chassis. The **tsTimeZone** command requires chassis permissions.

Because there is only one clock on the chassis, for the time server to function correctly, ensure that all logical switches in the fabric have the same NTP Clock Server configured. This includes any Pre-v6.2.0 switches in the fabric.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--old

Specifies the time zone in the offset format.

hourOffset

Specifies the number of hours relative to GMT. This operand must be specified as an integer. Valid values are -12 to 12. This operand is required with the **--old** option.

minuteOffset

Specifies the number of minutes relative to hour offset. This operand must be specified as an integer and is valid only with the --old option. Valid values are -30, 0, or 30. This operand is optional; if not specified, the value defaults to 0.

timezonename

Specifies the name of a time zone from the time zone database. Use **tstimezone** --interactive for a listing of valid time zone name.

--interactive

Interactively sets the timezone in name format.

EXAMPLES

To display the current time zone setup and then change it to GMT-3:30:

```
switch:admin> tstimezone
Time Zone Hour Offset: 0
Time Zone Minute Offset: 0
switch:admin> tstimezone -3, -30
Updating Time Zone configuration...done.
System Time Zone change will take effect at next reboot.
switch:admin> tstimezone
Time Zone Hour Offset: -3
Time Zone Minute Offset: -30
```

To set the current timezone to the zone to Pacific Time using the interactive command mode:

```
switch:admin> tsTimeZone --interactive
 Please identify a location so that time zone \
   rules can be set correctly.

turboRamTest

Performs a turbo SRAM test of ASIC chips.

SYNOPSIS

turboramtest

[--slot slot] [-passcnt count]

ceeturboramtest

[--slot slot] [-passcnt count]

DESCRIPTION

Use this command to verify the chip SRAM located in the ASIC using the turbo-RAM BIST circuitry. The BIST controller is able to perform the SRAM write and read operation at a much faster rate than the PCI operation.

The turboRamTest and ceeTurboRamTest commands are platform-specific versions of the same test. The turboRamTest command is supported on all Goldeneye2 and Condor-based platforms. Use ceeTurboRamTest on FCoE platforms only. On all other supported platforms, use turboramtest. Refer to the Fabric OS Troubleshooting and Diagnostics Guide, Appendix A, for a table that correlates ASIC type with switch models.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This diagnostic cannot be run on an operational switch. You must disable the switch using the chassisDisable command before you can run this test. After the test completes, re-enable the switch using the chassisEnable command.

OPERANDS

This command has the following optional operands:

--slot slot

Specifies the slot number on which the diagnostic operates. All eligible blade ports in the specified slot are tested. This operand is optional. The default value is 0 and operates on fixed port count products.

-passcnt count

Specifies the number of times to perform this test. This operand is optional. The default value is 1.

EXAMPLES

To run the SRAM test with two passes:

```
switch:admin> turboramtest -passcnt 2
Running turboramtest .....
PASSED.
```

To run the SRAM test on a Brocade 8000 in default mode:

```
switch:admin> turboramtest
Running turboramtest .....
PASSED.
```

SEE ALSO None

upTime

Displays length of time the system has been operational.

SYNOPSIS

uptime

DESCRIPTION

This command displays the current time, how long the system has been running, how many users are currently logged on, and the system load averages for the past 1, 5, and 15 minutes.

If the uptime is less than 60 seconds, the time is displayed in seconds. For times greater than or equal to 60 seconds, the time is displayed in minutes. The output format adjusts accordingly.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS None

EXAMPLES To display the length of time the system has been operational:

switch:admin> uptime
12:03am up 4:56, 3 users, load average: 1.17, 1.08, 1.08

SEE ALSO date, fastBoot, reBoot

uRouteConfig

Configures a static route.

SYNOPSIS

urouteconfig in area domain out area

DESCRIPTION

Use this command to configure static routes. A static route is assigned to a specific path (defined by port number out_area) and does not change when a topology change occurs unless the path used by the route becomes unavailable.

After this command is issued, if out_area port is associated with a valid minimum-cost path, all frames coming in from the in_area port addressed to domain are forwarded through the out_area port. If the out area port is not associated with such a path, the routing assignment is not immediately affected by this command. However, the static route is remembered so that it can be enforced if this port becomes part of a valid path in the future.

If a static route requires hardware resources that are already used, a platform conflict warning message is displayed and the configuration does not take effect.

When using static routes, load sharing may be affected. The switch attempts to optimize load sharing, but if too many routes are statically configured to use the same output port, a fair load sharing may not be achievable.

To prevent routing loops, static route requests involving non-minimum-cost paths are not enforced.

NOTES

Static route configuration is not supported on the Brocade 300, 5100, 5300, and DCX platforms.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

in_area

Specifies the input port to be statically routed. The in_area parameter can refer to

either an F_Port or an E_Port.

domain

Specifies the destination domain.

out_area

Specifies the output port to which traffic is forwarded.

EXAMPLES

To configure a static route for all traffic coming in from port 1 and addressed to domain 2 to go through port 5:

```
switch:admin> urouteconfig 1 2 5
done.
switch:admin> urouteshow 1/1 2
Local Domain ID: 1
In Port Domain Out Port Metric Hops Flags Next (Dom, Port)
                        500
                                              2,5
```

SEE ALSO

configShow, interfaceShow, uRouteRemove, uRouteShow

uRouteRemove

Removes a static route.

SYNOPSIS urouteremove in area domain

DESCRIPTION Use this command to remove a previously configured static route.

> After this command is issued, the route to domain for in_area might change to use a different output port, but only if Dynamic Load Sharing (DLS) is set. If DLS is not set, the route remains as is, with its route

attribute changed from static to dynamic.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS This command has the following operands:

in_area

Specify the input port of the static route to remove. *in_area* can be either an

F_Port or an E_Port.

domain

Specify the destination domain of the static route to remove.

EXAMPLES To remove a static route for all traffic coming in from port 1 and addressed to domain 2:

switch:admin> urouteremove 1 2

done.

SEE ALSO configShow, dlsShow, uRouteConfig, uRouteShow

uRouteShow

Displays unicast routing information.

SYNOPSIS urouteshow [slot/][port] [domain]

DESCRIPTION

Use this command to display the unicast routing information for a port, as it is known by the FSPF path selection and routing task. The routing information describes how a frame that is received from a port on the local switch is to be routed to reach a destination switch.

The following information displays:

Local Domain ID

Domain number of local switch.

In Port

Port from which a frame is received. Except for the cases in which you perform a port swap or enable extended-edge PID (PID Format 2) on a switch, the value is equal to the port index field displayed by the **switchShow** command. Refer to *Fabric OS Administrator's Guide* for more information regarding the extended edge PID format.

eage Pi

Domain

Destination domain of incoming frame.

Out Port

Port to which the incoming frame is to be forwarded. Except for the cases in which you perform a port swap or enable extended edge PID (PID Format 2) on a switch, the value is equal to the port index field displayed by the **switchShow** command. For port swap operations, the value is equal to the switch port field displayed by the **portSwapShow** command. Refer to *Fabric OS Administrator's Guide* for more information regarding the extended-edge PID format.

Metric

Cost of reaching the destination domain.

Hops

Maximum number of hops required to reach the destination domain. If the number of hops are different for some multiple equal cost paths (to reach the same

domain), then it displays the maximum number.

Flags

Indicates rout type as either dynamic (D) or static (S). A dynamic route is discovered automatically by the FSPF path selection protocol. A static route is

assigned using the command uRouteConfig.

Next (Dom, Port)

Domain and port number of the next hop. These are the domain number and the port number of the switch to which Out Port is connected.

The information provided by this command should match what is provided by **portRouteShow** and **topologyShow**.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

slot

For bladed systems only, specify the slot number of the input port whose routes are displayed, followed by a slash (/).

port

Specify the number of the input port whose routes are to be displayed, relative to its slot for bladed systems. Use **switchShow** to display a list of valid ports. This operand is optional; if omitted, the command displays routing information for all input ports in the switch.

domain

Specify a remote domain in the fabric for which routing information is to be displayed. This operand is optional; if omitted, the routing information for all domains in the fabric is displayed.

EXAMPLES

To display the routing information of all the active ports:

switch:admin> urouteshow Local Domain ID: 3 In Port Domain Out Port Metric Hops Flags Next (Dom, Port) 0 1 11 1000 1 D 1,0 Type <CR> to continue, Q<CR> to stop: 2 0 1500 2 4,0 Type <CR> to continue, O<CR> to stop: 4 0 500 1 D 4,0 27 1000 16 1,1 Type <CR> to continue, Q<CR> to stop: 27 16 1500 4,16

To display the routing information of port 11 to domain 4 only:

```
switch:admin> urouteshow 1/11, 4

Local Domain ID: 3

In Port Domain Out Port Metric Hops Flags Next (Dom, Port)

11 4 16 500 1 D 4,16
```

usbStorage

Manages data files on an attached USB storage device.

SYNOPSIS

```
usbstorage [-e | --enable]
```

usbstorage [-d | --disable]

usbstorage [-I | --list]

usbstorage [-r | --remove area target]

usbstorage [-h | --help]

DESCRIPTION

Use this command to control a USB device attached to the Active CP. When the USB device is enabled. other applications, such as supportSave, firmwareDownload, or configDownload/cfgUpload can conveniently store and retrieve data from the attached storage device. Refer to the help pages for these commands for specific information on how the USB device is accessed by each application.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

This command is available only on the Active CP.

OPERANDS

This command has the following operands:

-e | --enable

Enables the USB device. The USB device must be enabled before the list and remove functions are available.

-d | --disable

Disables an enabled USB device. This command prevents access to the device until it is enabled again.

-r | --remove area target

Removes a target in a specified application storage area. Valid areas are: firmware, support, config, or firmwarekey. A specified area must be followed by a target. Any existing file in a given application directory can be specified as a target. This command removes all data associated with the specified target.

-I | --list

Lists the content of the USB device up to two levels down from the root directory.

-h | --help

Displays the command usage.

EXAMPLES

To enable an attached USB device:

```
switch:admin> usbstorage -e
USB storage enabled
```

To list the contents of the attached USB device:

switch:admin> usbstorage -1

firmwarekey\	0B	2010 Aug	15 15:13
support\	106MB	2010 Aug	24 05:36
support1034\	105MB	2010 Aug	23 06:11
config\	0B	2010 Aug	15 15:13
firmware\	380MB	2010 Aug	15 15:13
FW_v6.4.0\	380MB	2010 Aug	15 15:13
Available	space on	usbstorage	74%

To remove a firmware target from the firmware application area:

```
switch:admin> usbstorage -r firmware FW_v6.0.0
```

To disable an attached USB device:

```
switch:admin> usbstorage -d
USB storage disable
```

SEE ALSO supportSave, firmwareDownload, configUpload, configDownload

userConfig

Manages user accounts.

```
SYNOPSIS
```

```
userconfig
```

```
userconfig --show [username | -a | -r rolename]
```

```
userconfig --show ad -a AD_ID
```

```
userconfig --showlf -I LF ID | -c
```

```

   [-r role -l LF_ID_list] [-c chassis_role]
```

userconfig --deletelf username [-h LF_ID][-l LF_ID_list] [-c]

userconfig --delete username

userconfig --help

DESCRIPTION

Use this command to manage user accounts on a switch. The command options and behavior depend on your environment.

- In an Admin Domain-enabled environment, you can configure the account's username, its role, and the Admin Domains that the account may access. An account is assigned a single role. An account can access multiple Admin Domains, but only one Admin Domain at a time. New accounts created take on the role specified during account creation.
- In a Virtual Fabric-enabled environment, you can configure the account's username, its role, and the logical fabrics that the account may access. An account can have different roles for different Logical Fabrics. An account can access multiple Logical Fabrics, but only one Logical Fabric at a time.

When executed without operands, this command displays the usage. The logical fabric command options are displayed only if Logical Fabrics are enabled on the switch.

You can execute the userConfig command on any switch. When the command completes, account information is saved persistently. On platforms supporting multiple switch domains, account information is saved only to the switch domain, in which the command was executed.

Use the **distribute** command to distribute the account database manually to other switches in the fabric. Target switches must be configured to accept the database. Accounts that are not consistent with the distributed database are overwritten. Account recovery from backup or access to backup data is not supported..

This command supports the following roles. These roles define access permissions for Fabric OS Commands. In a Logical Fabric environment, you can additionally define access to chassis-level commands. An account can have one role in the Logical Fabric, and another role regarding chassis commands.

User

Nonadministrative use, such as monitoring system activity.

Operator

A subset of administrative tasks for routine switch maintenance.

SwitchAdmin

Administrative use excluding security, user management, and zoning.

ZoneAdmin

Zone management.

FabricAdmin

Administrative use excluding user management and AD management.

BasicSwitchAdmin

Administrative use with a subset of admin-level commands, mostly for monitoring

with limited switch (local) access.

Admin

All administrative commands.

SecurityAdmin

All switch security and user management functions.

NOTES

The userConfig command operates on the switch-local user database only, regardless of whether the switch is configured to use RADIUS or LDAP authentication.

The account database supports a maximum of 256 customer created accounts.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--show

Displays user account information. Only accounts with SecurityAdmin and Admin roles can show information about accounts other than the current login account.

The following operands are optional:

username

Specifies the account login name. When no operand is specified, the command

displays the current account information.

-a

Displays information about all accounts.

-r rolename

Displays information about all accounts with the specified role.

--showad

Displays Admin Domain permissions in an AD-enabled environment. The following operand is required:

-a AD_ID_list

For each AD in AD_ID_list, displays a list of users that include that AD in their AD permissions. Specify a range (1-5) or a list of AD_IDs separated by a comma (1,2,3), or a combination of both (1-5,7). Only users with SecurityAdmin or Admin role may execute this command.

--showlf

Displays Logical Fabric permissions in an LF-enabled environment. Only users with SecurityAdmin or Admin role may execute this command. An operand is required with this command. The following operands are mutually exclusive:

-I LF_ID

For each LF in *LF_ID_list*, displays a list of users that include that LF in their LFF permissions. Specify a range (1-5), or a list of LF_IDs separated by a comma (1,2,3), or a combination of both (1-5,7). Only users with SecurityAdmin or Admin role may execute this command.

-c

Displays a list of users who have permission to execute chassis commands.

--add | --change

Creates a new user account or modifies an existing user account. The following restrictions apply when you create or modify a user account:

- You cannot change the role, the AD or LF permissions, the home AD or the home LF of any default account.
- You cannot change the role, the AD or LF permissions, or the description of accounts at the same or a higher authorization level.
- You cannot change the role, the AD or LF permissions, or the home AD or home Logical Fabric of your own account.
- No account can disable itself.
- AD or LF permissions must be a subset of the respective AD or LF permissions of the account that creates or modifies a user account.
- In an LF-enabled environment, you can change the role associated with existing LFs but you cannot add new LFs or delete any existing LFs.
- The account name cannot be the same an existing user account, a default role, a user-defined role, or a system role. System roles are used by internal switch processes and include the following: bin, daemon, sys, adm, tty, disk, lp, mem, kmem, wheel, mail, news, uucp, man, dip, ftp, nobody, users, floppy, console, utmp, and slocate. If the specified username already exists, this command fails with an appropriate message. Choose a different username and reissue the command.

The following operands are supported with the **--add** and **--change** option

username

Specifies the login name of the account to be created or modified. Enter a valid login name to modify an existing account. For new accounts, the name must be unique and must begin with an alphabetic character. User names are case-sensitive and can contain up to 40 alphanumeric characters, including periods (.) and underscore (_) characters.

-r role

In an AD-enabled environment, this operand specifies the role for the account. In an LF-enabled environment, this operand specifies the account's role for all LFs provided with the LF list. When you create a user account in an LF-enabled environment, you can specify only one role for the user. This role is associated with each of the LF IDs in the specified LF_ID_list. Once the account is created, you can use the --addlf option to create another list of LF IDs with its own set of associated roles.

Valid roles are: User, SwitchAdmin, ZoneAdmin, FabricAdmin, BasicSwitchAdmin, Operator, or Admin. This operand is required with the **--add** option; it is optional with the **--change** option.

-h AD_ID | LF_ID

Specifies the home Administrative Domain or the home Logical Fabric depending on the environment. This operand is optional. If no AD or LF is specified with the **--add** option, the system assigns the lowest numbered AD or LF the user is authorized to access.

-a AD_ID_list

Specifies the Administrative Domains the user is authorized to access. The ADs in AD_ID_list and the existing AD permissions for username must be a subset of the AD permissions of the account that executes this command. This operand is optional. If no AD list is specified with the **--add** option, AD0 is assigned by default. Use comma-separated lists, ranges, or both, for example **-a** 0,9,10-15,244.

-I LF_ID_list

Specifies the Virtual Fabrics the user is authorized to access. The LFs in LF_ID_list and the existing LF permissions for username must be a subset of the LF permissions of the account that executes this command. This operand is required with the **--add** option. It is optional with the **--change** option.

-c chassis_role

Specifies the account's access permissions at the chassis level. The chassis role allows the user to execute chassis-related commands in an LF-enabled environment. To assign the chassis role to an account, the executing account must have chassis-level permissions. Valid chassis roles are: User, SwitchAdmin, ZoneAdmin, FabricAdmin, BasicSwitchAdmin, Operator, or Admin.

-d description

Provides a description for the new account. This operand is optional. The maximum length is 40 printable ASCII characters. Some characters that are interpreted by the shell (", ', ! etc.) require a preceding escape character (\). To include spaces, place the description in double quotation marks. Colons are not permitted.

-x

Optionally specifies an expired password that must be changed the first time the user logs into a new or modified account. This command also prompts for the existing password.

The following optional operand is available only with the **--add** option:

-p password

Specifies a password for the account. This operand is optional; if omitted, the command prompts for an initial password for the account. The password must satisfy all currently enforced password rules. By default the password is created with the configured expiration period.

The following optional operands are available only with the **--change** option:

-e yes | no

Enables or disables an account. Specify "yes" to enable or "no" to disable an account. Once an account is disabled, the CLI sessions associated with the account are terminated.

-u

Unlocks the specified user account. User accounts can get locked after several attempts to log in with an invalid password. Refer to the **passwdCfg** help page for more information.

--addad | --deletead

Adds one or more ADs to a user account or deletes ADs from a user account. The following operands are supported:

username

Specifies the account login name.

-h AD_ID

Specifies the account's home AD. This operand is optional.

- If home AD is specified with the --addad option, it must be one of the ADs in AD_ID_list. If a home AD is not specified and username did not previously have a home AD, the home AD is set to the lowest numbered AD in the user's AD permissions.
- If a home AD is specified with the --deletead option, it must be one of the ADs in the AD permissions remaining after the ADs specified in AD_ID_list have been removed. If a home AD is not specified, the current home AD remains unchanged, if it is still in the user's AD permissions. If a home AD is not specified and the user's current home AD is deleted, the new home AD is set to the lowest numbered AD in the user's AD permissions.

The existing AD permission for username, and the AD_ID_list must be a subset of the AD permissions of the account executing this command.

-a AD_ID_list

Specifies the AD IDs to be added or deleted. Specify a range (1-5) or a list of AD_IDs separated by comma (1,2,3), or a combination of both (1-5,7).

--addlf | --deletelf

Adds Logical Fabric or chassis permissions to a user account or deletes LF or chassis permission from a user account. The following operands are supported:

username

Specifies the account login name.

-h LF_ID

Specifies the account's home LF. This operand is optional.

- If a home LF is specified with the --addlf option, the home LF must be one of the LFs in LF_ID_list. If a home LF is not specified and the account did not previously have a home LF, the home LF is set to the lowest numbered LF in the user's LF permissions.
- If a home LF is specified with the --deletelf option, the home LF must be one of the LFs in the LF permissions remaining after the LFs specified in LF_ID_list have been removed. If a home LF is not specified, the current home LF remains unchanged, if it is still in the user's LF permissions. If a home LF is not specified and the current home LF is deleted, the new home LF is set to the lowest numbered LF in the user's LF permissions.

The account's existing LF permission and the LF_ID_list must be a subset of the LF permissions of the account executing this command.

-I LF_ID_list

Specifies the logical fabric IDs to be added or deleted. Specify a range (1-5) or a list of AD_IDs separated by comma (1,2,3), or a combination of both (1-5,7).

-r role

Specifies the role associated with the LFID list given in this command. This operand is required when you specify an *LF_ID_list*.

-c [chassis_role]

Specifies the account's access permissions regarding chassis-level commands. To remove an account's chassis permissions, specify **-c** only. To add chassis permissions, specify a chassis role with the **--c** option.

--delete username

Deletes the specified account from the switch. This command prompts for confirmation. Once an account is deleted, the CLI sessions associated with the account are terminated.

The following restrictions apply when you delete an account:

- You cannot delete a default account.
- You cannot delete your own account.

AD_ID_list or LF_ID list and associated AD or LF permissions for username must be a subset of the AD or LF permissions of the account that executes the userConfig --delete command.

--help

Displays the command usage. In an LF-enabled environment, LF-specific options are displayed. In an AD-enabled environment, AD-specific options are displayed.

EXAMPLES

A. The following examples illustrate how to create and manage user accounts in an AD-enabled environment.

To add a new account:

```
switch:admin> userconfig --add joe -r admin -d "Joe Smith"
Setting initial password for joe
Enter new password:
Re-type new password:
Account joe has been successfully added.
```

To add a new account noninteractively:

```
switch:admin> userconfig --add joe -r admin \
    -d "Joe Smith" -p welCome2brcd
Account joe has been successfully added.
```

To display current account information:

```
switch:admin> userconfig --show joe
Account name: joe
Role: admin
Description: Joe Smith
Enabled: Yes

Password Last Change Date: Unknown
Password Expiration Date: Not Applicable
Locked: No
AD membership: 0
Home AD: 0
```

To disable the account "joe":

```
switch:admin> userconfig --change joe -e no
Broadcast message from root Sat Apr 2 03:03:32 2005...
Security Policy, Password or Account Attribute \
   Change: joe will be logged out
Attribute for account joe has been successfully changed.
```

To add an account named bob with role ZoneAdmin and AD member list 1,4,10,11,12,13,14 and Home AD 4:

```
switch:admin> userConfig --add bob -r ZoneAdmin \
     -a 1,4,10-14 -h 4
```

To change account bob's AD member list to 128 and 129, Home AD to 128:

```
switch:admin> userConfig --change bob -a 128,129
```

To add AD 0 and 255 to bob's AD member list. Home AD is unchanged:

```
switch:admin> userConfig --addad bob -a 0,AD255
```

To delete AD 128 from bob's AD member list. New home AD is set to 0:

```
switch:admin> userConfig --deletead bob -a 128 -h 0
```

B. The following examples illustrate how to create and manage user accounts in an LF-enabled environment.

To create a new account named "test" with admin role and admin chassis permissions in the LF member list 1-10:

```
switch:admin> userconfig --add test -l 1-10 \
     -r admin -c admin
Setting initial password for test
Enter new password:
Re-type new password:
Account test has been successfully added.
```

To display current account information:

```
switch:admin> userconfig --show test
Account name: test
Role: admin
Description:
Enabled: Yes
Password Last Change Date: Sat Jun 14 2008
Password Expiration Date: Not Applicable
Locked: No
RoleLFMaps: admin: 1-10 chassis
Chassis Role: admin
Home Context: 1
```

To grant user access permissions to the test account for the Virtual Fabrics 11-15:

```
switch:admin> userconfig --addlf test -r user -l 11-15
New LFs/Chassis role for account test has been \
   successfully added.
```

To change the test account's access permissions for the Logical I Fabrics 5 and 6 to ZoneAdmin and the chassis permission to user:

```
switch:admin> userconfig --change test -r zoneadmin \
    -1 1-5 -c user -h 4
Broadcast message from root (ttyS0) Sat Jun 14 01:05:28 2008...
Security Policy, Password or Account Attribute Change: \
    test will be logged out
```

To display the test account information:

```
switch:admin> userconfig --show test
Account name: test
Role: zoneadmin
Description:
Enabled: Yes
Password Last Change Date: Sat Jun 14 2008
Password Expiration Date: Not Applicable
Locked: No
RoleLFMaps: zoneadmin: 1-5 admin: 6-10 user: 11-15 chassis
Chassis Role: user
Home Context: 4
```

To remove chassis permissions from the test account for the LFs 1-3.

```
switch:admin> userconfig --deletelf test -1 1-3 -c
Broadcast message from root (ttyS0) Sat \
    Jun 14 01:10:02 2008...

Security Policy, Password or Account Attribute Change: \
    test will be logged out
LFs/chassis role for account test has been successfully\
    deleted.
```

To display information for all accounts with admin privileges:

```
switch:admin> userconfig --show -r admin
Account name: admin
Description: Administrator
Enabled: Yes
Password Last Change Date: Unknown
Password Expiration Date: Not Applicable
Locked: No
Home LF Role: admin
Role-LF List: admin: 1-128
Chassis Role: admin
Home LF: 128
Account name: testls1
Description:
Enabled: Yes
Password Last Change Date: Sun Oct 5 2025
Password Expiration Date: Not Applicable
Locked: No
Home LF Role: admin
Role-LF List: admin: 1
No chassis permission
Home LF: 1
```

SEE ALSO None

version

Displays firmware version information.

SYNOPSIS version

DESCRIPTION Use this command to display firmware version information and build dates.

The command output includes the following:

Kernel

The version of switch kernel operating system.

Fabric OS

The version of switch Fabric OS.

Made on

The build date of firmware running in switch.

Flash

The build date of firmware stored in flash proms.

BootProm

The version of the firmware stored in the boot PROM

Usually the Made on and Flash dates are the same, because the switch starts running flash firmware at power-on. However, in the time period between firmwareDownload and the next reboot, the dates can differ.

OPERANDS None

EXAMPLES To display the firmware version information in a switch:

> switch:admin> version Kernel: 2.6.14.2 Fabric OS: v6.1.0

Made on: Wed Feb 13 06:59:17 2008 Flash: Thu Feb 14 18:38:31 2008

BootProm: 4.6.6

SEE ALSO firmwareDownload, reBoot

wwn

Displays the world wide name (WWN) and factory serial number of the switch or chassis.

SYNOPSIS

wwn [-sn]

DESCRIPTION

Use this command to display the WWN associated with a switch or chassis and to display the factory serial number. The WWN is a 64-bit number that has eight colon-separated fields each consisting of one or two hexadecimal digits between 0 and ff. The WWN is a factory-set parameter that cannot be changed by the end user. The WWN is used as the license ID in many cases, but the only official string to be used for requesting licenses is the **licenseidShow** output. Alternately, use **switchShow** to display the WWN.

In addition to the WWN, all switches have a unique 24-bit Fibre Channel address that is used for communicating with the switch. Use **fabricShow** to display the FC address in addition to the WWN.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

-sn

On enterprise-class platforms, this operand displays the chassis factory serial number following the WWN. On standalone platforms, it displays the factory serial number. This operand is optional; if omitted, this command displays only the WWN for the switch or chassis.

EXAMPLES

To display the WWN on a Brocade DCX-4S:

```
switch:admin> wwn
10:00:00:05:1e:7a:7a:00
```

To display the WWN and chassis factory serial number:

```
switch:admin> wwn -sn

WWN: 10:00:00:05:1e:7a:7a:00
SN: ANP0645D05B

switch:admin> chassisshow | grep ANP0645D05B
Chassis Factory Serial Num: ANP0645D05B
switch:admin>
```

To display the license ID:

```
switch:admin> licenseidshow
10:00:00:05:1e:7a:7a:00
```

To display the WWN and the Fibre Channel address:

To display the WWN on a Brocade 5100:

```
switch:admin> wwn
10:00:00:05:1e:7a:7a:00
```

To display the WWN and factory serial number:

```
switch:admin> wwn -sn
WWN: 10:00:00:05:1e:82:3c:2a
SN: ALM0602E003
switch:admin> chassisshow | grep ALM0602E003
```

Factory Serial Num: ALM0602E003

SEE ALSO chassisShow, fabricShow, licenseldShow, switchShow

wwnAddress

Binds an FC Port ID to a device WWN.

SYNOPSIS

wwnaddress --bind [WWN] [PID]

wwnaddress --unbind [WWN]

wwnaddress --show

wwnaddress --findPID [WWN]

wwnaddress --help

DESCRIPTION

Use this command to manage address assignments for a given device world wide name. The allocation of a PID to a specified device WWN supports the persistence of the PID based on the WWN of the device to which the PID is bound. If the PID is not bound to a device WWN, the device can get the same or a different PID irrespective of which port it logs in to a given switch partition.

This command fails under any of the following conditions:

- The PID is currently bound to another port through port address binding. Use portaddress --unbind to free up the PID.
- The WWN is already bound with a different PID, or the PID is bound to another WWN. Use **wwnaddress --unbind** to remove the PID-WWN binding.
- There is no space left in the WWN-PID table for an additional entry. Use wwnaddress --unbind to free up space in the table.

The command provides a **--show** option that displays the currently bound address for all WWNs. Alternately, you can use the **--findPID** option to display the PID currently bound to a specified WWN.

NOTES

Dynamic Area Mode and WWN-Based persistent PID must be enabled on the switch before you can assign an address with this command. Refer to **configure** for more information.

This command is supported only on the Brocade DCX and on the DCX-4S.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operands:

--bind

Assigns the lower two bytes of the Fibre Channel address to the specified WWN.

WWN

Specifies the WWN for the device to which the PID should be assigned.

PID

Specifies the PID (the lower 16 bits of the address excluding the domain part) in hexadecimal format to be bound to the device WWN. Note that only the upper 10 bits of the PID can be used for a unique route. Therefore, not all addresses in the 16-bit range are available.

Removes the WWN-PID binding corresponding to the specified device WWN.

WWN

--unbind

Specifies the WWN for the device from which to remove the PID binding.

--show Displays all WWN-PID entries currently present in the partition. --findPID

Displays the PID currently bound to the specified device WWN.

WWN

Specifies the device WWN.

--help

Displays the command usage.

EXAMPLES

To bind a 16-bit address to a device WWN:

switch:admin> wwnaddress --bind \ 10:00:00:06:2b:0f:76:5f 0x9000

To unbind a given address from a WWN:

switch:admin> wwnaddress --unbind \ 10:00:00:06:2b:0f:76:5f

To display all WWN address bindings on the current partition:

switch:admin> wwnaddress --show

# WWN	Area .	Age I	Flag
1) 10.00.00.00.00.05.71.0			
1) 10:00:00:06:2b:0f:71:0c 2) 10:00:00:05:1e:5e:2c:11	0x405 0x9900		0x12 0x21

zone --rddelete name

DESCRIPTION

The **zone** command supports three types of operations: specific zone operations, management of Traffic Isolation Zones, and management of Frame Redirect (RD) Zones.

1. Manage Zoning Operations

Use the **--copy**, **--expunge**, and **--validate** options to perform specific zoning operations. These commands follow a batched-transaction model.

2. Manage Traffic Isolation (TI) Zones

Use the **--create**, **--add**, **--remove**, **--delete**, **--activate**, **--deactivate**, and **--show** options to manage Traffic Isolation Zones.

TI zones control the flow of interswitch traffic by provisioning certain E_Ports to carry only traffic flowing from a specific set of source ports. The provision (a.k.a TI Zone) is part of the defined zone configuration and does not appear in the effective zone configuration. A Maximum of 255 TI Zones can be created in one fabric.

TI zones over FCR provide the ability to lock down a request and corresponding response to the same VE_Port tunnel for a given pair of devices in two separate fabrics. TI over FCR has two working parts:

- TI within edge fabric routes traffic between a real device and a Proxy device to a specified EX_Port.
- TI within backbone fabric locks down the route within the backbone fabric based on EX_Ports and devices involved.

Use the --showTlerrors option to generate a report of potential routing problems in the local Domain. If the command detects errors, it outputs the ID of the current domain, and for each record, it displays the following information:

Error Type

Error or Warning.

Affected Remote Domain

Domain where the traffic drop is likely to be happening.

Affected Local Port

Device port shared by the TI zones.

Affected TI Zones

Lists the names of the TI zones implicated in the problem.

Affected Remote Ports

Remote ports that are affected by the problem in the TI Zones.

Using TI zones in logical fabrics has several restrictions. TI zones created in logical fabrics cannot include logical interswitch links (LISLs); only physical port numbers can be included. TI zones cannot use the failover disabled option in Logical fabrics that have LISLs, and TI zones cannot use the failover disabled option in Base Fabrics. For more information, refer to the Fabric OS Administrator's Guide.

3. Manage Frame Redirect (RD) Zones

Use the --rdcreate and --rddelete options to manage Frame Redirect Zones. RD zones allow frames to be redirected to devices that can perform additional processing on these frames (for example, encryption). The feature uses a combination of RD zones and Name Server changes to map real device world wide names (WWNs) to virtual port IDs (PIDs.) This allows redirecting a flow between a host and target to a device that can perform its functionality without reconfiguring the host and target.

The RD Zone is part of the defined zone configuration and does not appear in the effective zone configuration. Use cfgSave to save the RD zone changes to the defined configuration. Use cfgShow to display the RD zones.

When you create the first RD zone, two additional zone objects are created automatically: A base zone base" and a zone configuration "r_e_d_i_r_c__fg". These additional zone objects are required by the implementation. These zone objects must remain on the switch as long as other redirect zones are defined. Do not remove these objects, unless redirection is no longer required and no other redirect zones exist.

Use **zone --rddelete** to remove the base RD zone, "red_ base", if it is the last remaining RD zone in the RD zone configuration, "r_e_d_i_r_c_fg." When the base zone is removed, the RD zone configuration is removed as well.

NOTES

Device ports are allowed to be part of several TI zones to support enhanced TI zone deployment in FICON environments.

You cannot swap E_Ports that are configured as part of a TI zone. The TI zone information is lost when you use **portSwap** to swap the E_Ports. To work around this issue, reconfigure your TI zones rather than swapping the E Ports.

The current zone commands, zoneCreate, aliCreate, cfgCreate, etc., cannot be used to manage special zones, such as TI zones or RD zones.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command takes as an operand an action and its associated arguments. When executed without operands, the command displays the usage.

--help

Displays the command usage.

1. Commands for performing specific zone operations

--сору

Copies a specified zone object or all zone objects from the *source_AD* into the current AD. The current AD transaction buffer is used for this operation. The following operands are optional:

source_AD

Specifies the source Admin Domain of the zone objects. If unspecified, objects are copied within the current AD.

source zone object

Specifies the zone object under the *source_AD*. The zone object can be a zone configuration, a zone alias, or several zones. If a source zone object is not specified, all zone configurations are copied over to the current Admin Domain.

dest_zone_object

Identifies the destination zone object within the current Admin Domain. If <code>dest_zone_object</code> is not specified, <code>source_zone_object</code> is copied over with the same name. If the destination zone object is not already present in the Admin Domain, one is created (with type as <code>source_zone_object</code>).

-f

Overwrites existing zone object without confirmation.

--expunge

Removes all references to the specified zone object and then deletes the zone object. The command displays the list of zone objects to be deleted and prompts for confirmation before deleting the zone objects. The removal of zone object references can trigger the removal of zones not specified in the command. For example, removing the last zone member from a zone deletes the zone, and may trigger a recursive deletion of other zones. The following operand is required:

"zone_object"

Specifies a zone object. A zone object can be a zone member, zone alias, or a zone. The zone object must be enclosed in double quotation marks.

--validate

Lists all zone members that are not part of the current zone enforcement table.

If a zone member is specified by Domain and Port (D,P) in the Admin Domain membership list, all zone elements specified with WWNs associated with that D,P are considered for zone enforcement. If a device WWN is specified in the Admin Domain member list, the corresponding D,P (the device the specified WWN is associated with) is not considered for zone enforcement.

The following operands are optional:

-f

Specifies that zone members that are not enforceable should be expunged in the transaction buffer. This pruning operation affects both the transaction buffer and the defined buffer. You cannot specify a mode or a zone object together with the foption.

mode

Specifies the zone database location. This operand is optional. If no mode option is specified, the validated output of all the three buffers is displayed. Supported mode flag values include the following:

0

Uses the zone database from the current transaction buffer.

1

Uses the zone database stored in persistent storage.

2

Uses the currently enforced zone database.

"zone_object"

Specifies a zone object. A zone object can be a zone member, a zone alias, or a zone.

2. Creating and managing TI Zones

Use these commands to create and manage TI Zones.

--create

Creates a TI Zone with specified options and port list.

--add

Adds port list members and the failover option to existing TI zones.

--remove

Removes port list members from existing zones. Removal of the last member from an active TI zone generates a warning. If the last member of a TI zone is removed, the TI zone name is removed from the defined TI zone list.

The following operands are supported:

-t objecttype

Specifies the zone object type. This operand is supported only with the **--create** option. To create a TI zone, the value is **ti**.

-o optlist

Specifies list of options to control activation, deactivation, and failover mode. If this option is not specified the zone is created, by default, with failover enabled, and the zone will be activated. This operand is supported only with the **--create** and **--add** options.

Valid values for *optlist* include the following:

а

Activates the specified zone.

d

Deactivates the specified zone.

n

Disables failover mode. In non-failover mode, when the last interswitch link (ISL) of a TI Zone goes offline and there is an alternative ISL, the alternative ISL is not used and the switch generates a state change notification (SCN) or a registered state change notification (RSCN) to indicate that no ISL is available. When the ISL of the TI Zone comes online again, the route is set up again and the switch generates another SCN or RSCN. TI zones with no-failover option are not supported in logical fabrics. TI zones defined in the Base Fabric for logical fabric traffic need to allow failover.

f

Enables failover mode. In failover mode, when the last ISL of a TI Zone goes offline and there is an alternative ISL, the alternative ISL is used and the switch does not generate any SCN or RSCN messages. If the ISL of that TI Zone comes online again, traffic is rerouted immediately to the original ISL.

name

Specifies the name of the zone to be created, added or deleted

2

-p portlist

Specifies the lists of ports to be included, added or removed from a TI zone. The syntax for *portlist* is "D,I" (Domain, Index). The port list must be enclosed in double quotation marks. List members must be separated by semicolons, followed by a space. When you create TI zones over FCR, for a TI within an Edge fabric use "-1"in "I" (of "D,I") in to denote Front and Translate phantom in the E_Port list. When creating a TI zone within the Backbone fabric specify "Port WWN" in *portlist* to indicate devices talking across fabrics.

--activate name

Activates the specified TI zones. If more than one zone is specified, the list of zone names must be enclosed in double quotation marks; zone names must be separated by semicolons.

--deactivate name

Deactivates the specified TI zones. If more than one zone is specified, the list of zone names must be enclosed in double quotation marks; zone names must be separated by semicolons.

--delete name

Deletes TI zones from the defined TI zone lists. This command prompts for confirmation.

--show [name]

Displays zone name, port lists, failover option, configured status and, the active status for the specified zones. The configured status reflects the latest change that may or may not have been activated. The active status reflects the state that is activated by **cfgEnable**. Without any specified name, this command displays all TI zones in the defined configuration. The following operand is optional:

-ascending

Displays the TI zone members in ascending order.

--showTlerrors

Analyzes real and potential routing problems with the activated TI zoning set and prints a report. This command must be executed in the local domain and analyzes only that domain.

3. Creating and managing RD Zones

--rdcreate

Creates a RD Zone for the specified members. The following operands are required:

host_wwn

Specifies the port world wide name of the host.

target_wwn

Specifies the port world wide name of the target.

vi_wwn

Specifies the port world wide name of the virtual initiator (VI).

vt_wwn

Specifies the port world wide name of the virtual target (VT).

policy restartable | nonrestartable

Specifies the policy as either **restartable** or **nonrestartable**. A restartable policy causes traffic flow to revert to the physical host and target configuration in the event the virtual device should fail. When the policy is specified as nonrestricted and one of the virtual devices goes offline, the physical devices are considered offline and no traffic is allowed between the original host and target.

FCR | noFCR

Indicates whether or not this RD zone should function across a Fibre Channel router (FCR). Specify FCR to support FCR. Specify noFCR if you do not wish to support FCR.

--rddelete name

Deletes the RD Zone specified by *name*. RD Zones are unique in that the zone name is not user-defined. It is derived based on members and the specified configuration. Use **cdfgShow** to display currently implemented RD zone by name.

1. Specific zone operation commands **EXAMPLES**

The following example shows a scenario of an invalid configuration. If you attempt to create a zone z10 with an alias a10, then create a zone with name a10, z10 expects a10 to be an alias and results in an invalid configuration.

To validate all zones in the currently enforced zone database:

```
switch:admin> zonecreate z10,a10
switch:admin> zonecreate a10, 1,2
switch:admin> zone --validate
Defined configuration:
zone: a10 1,2*
zone: z10 a10~
Effective configuration:
No Effective configuration: (No Access)
~ - Invalid configuration
* - Member does not exist
# - Invalid usage of broadcast zone
```

The reason for not being in the current enforcement table could be one of the following:

- The device is not online.
- The device is online but is not Admin Domain-aware.
- The device is online but it is not part of the current Admin Domain.

To copy the cur_cfg1 zone configuration from the root zone database (AD0) to the current Admin Domain:

```
switch:admin> zone --copy AD0.cur_cfg1
```

To copy the backup_zn zone from the root zone database (AD0) to the current Admin Domain:

```
switch:admin> zone --copy ADO.backup_zn
```

To copy the backup_zn zone from the root zone database (AD0) to the current Admin Domain, with Admin Domain member list filtering:

```
switch:admin> zone --copy -f ADO.backup_zn
```

To delete all references associated with zone member 100,5:

```
switch:admin> zone --expunge"100,5"
You are about to expunge one configuration
or member. This action could result in removing
many zoning configurations recursively.
[Removing the last member of a configuration
  removes the configuration.]
  Do you want to expunge the member?
  (yes, y, no, n): [no] yes
```

To validate all zones in the zone database in the current transaction buffer:

```
switch:admin> zone --validate -m 0
Defined configuration:
cfg: t_r_a_f_i_c_i_s_o_c__fg
               bluezone; greenzone
cfg:
       ticonfig
               regzone
 zone: bluezone
               1,1*; 1,2*
 zone: greenzone 1,1*; 20:01:00:05:1e:01:23:e0*
 zone: regzone 1,4*; 1,5*
 zone: t_r_a_f_i_c_i_s_o_prop_zn
              1,3*; 2,3*
 ~ - Invalid configuration
 * - Member does not exist
 # - Invalid usage of broadcast zone
```

To validate all zones in the zone database in the persistent storage (defined configuration):

```
switch:admin> zone --validate -m 1
Defined configuration:
      t_r_a_f_f_i_c_i_s_o_c__fg
              bluezone; greenzone
cfq:
      ticonfig
              regzone
zone: bluezone
              1,1*; 1,2*
zone: greenzone 1,1*; 20:01:00:05:1e:01:23:e0*
 zone: regzone 1,4*; 1,5*
 zone: t_r_a_f_f_i_c_i_s_o_prop__zn
              1,3*; 2,3*
 _____
~ - Invalid configuration
* - Member does not exist
 # - Invalid usage of broadcast zone
```

To validate all zones in the zone database in the effective configuration:

To prune all the zone members that are not enforceable:

```
switch:admin> zone --validate -f
You are about to prune the zone configurations,
based on zone --validate output.
Do you want to prune the zone
configurations (yes, y, no, n): [no] y
```

2. Traffic isolation zone commands

To create an activated traffic isolation zone with failover enabled (default).

```
switch:admin> zone --create -t ti purplezone \
     -p "1,1; 2,4; 1,8; 2,6"
```

To create a deactivated traffic isolation zone with failover disabled:.

```
switch:admin> zone --create -t ti -o dn purplezone \
     -p "1,1; 2,4; 1,8; 2,6"
```

To add an E_Port and N_Port member as a *portlist* to an existing TI zone:

```
switch:admin> zone --add purplezone \
     -p "3,4; 3,6"
```

To add the option to disable failover for a TI zone:

```
switch:admin> zone --add -o n purplezone
```

To add the option to enable failover for a TI zone:

```
switch:admin> zone --add -o f greenzone" -p "3,4"
```

To remove portlist members from an existing TI zone.

```
switch:admin> zone --remove bluezone -p "3,4; 3,6"
```

To activate the TI zone "bluezone":

```
switch:admin> zone --activate bluezone
```

To deactivate the TI zone "purplezone":

```
switch:admin> zone --deactivate purplezone
```

To delete the TI zone "bluezone":

```
switch:admin> zone --delete bluezone
```

To display all TI zones in the defined configuration:

```
switch:admin> zone --show
Defined TI zone configuration:
TI Zone Name:
                ti_blue
Port List: 4,55; 10:00:00:00:00:01:00:01; \
   10:00:00:00:00:01:00:04; 3,9
Configured Status: Activated / Failover-Disabled
Enabled Status: Deactivated
```

```
TI Zone Name: ti_red
Port List: 4,4; 5,5; 3,3

Configured Status: Activated / Failover-Enabled
Enabled Status: Activated / Failover-Enabled
```

To display all TI zones in the defined configuration in ascending order:

```
switch:admin> zone --show -ascending

Defined TI zone configuration:

TI Zone Name: ti_blue
Port List: 10:00:00:00:01:00:01; \
    10:00:00:00:00:01:00:04; 3,9; 4,55

Configured Status: Activated / Failover-Disabled Enabled Status: Deactivated

TI Zone Name: ti_red
Port List: 3,3; 4,4; 5,5

Configured Status: Activated / Failover-Enabled Enabled Status: Activated / Failover-Enabled
```

To display a specified zone in the defined configuration:

```
switch:admin> zone --show ti_red
Defined TI zone configuration:

TI Zone Name: ti_red
Port List: 4,4; 5,5; 3,3

Configured Status: Activated / Failover-Disabled
Enabled Status: Deactivated
```

To display members for the zone "ti_red" in ascending order:

```
switch:admin> zone --show ti_red -ascending
Defined TI zone configuration:

TI Zone Name: ti_red
Port List: 3,3; 4,4; 5,5

Configured Status: Activated / Failover-Disabled
Enabled Status: Deactivated
```

To create an FCR TI zone within an Edge fabric where a host should talk to target1 and target4 through port number 2 on an Edge fabric switch with a domain ID of 3. (in the example, "3,1" is the host, and the remaining members are E_Ports):

```
switch:admin> zone --create -t ti fcr_edge_ti_zone \
    -p "3,1; 3,2; 4,-1; 5, -1"
```

To create an FCR TI zone within a Backbone where a host, target1, and target4 communicate over VE_Ports consisting of FCR1 port number 4 and FCR2 port number 7:

```
switch:admin> zone --create -t ti fcr_ti_zone \
    -p "1,1; 2,1;host_PWWN; target1_PWWN; \
    target4_PWWN; 1,4; 2,7"
```

To troubleshoot TI zone problems:

```
switch:admin> zone --showTIerrors
My Domain: 1
Error type:
                    ERROR
Affected Remote Domain:
Affected Local Port: 3
Affected TI Zones: til, ti2
Affected Remote Ports: 6, 7, 8, 9
```

3. Frame redirect zone commands

To create an RD Zone, given a host (10:10:10:10:10:10:10), target (20:20:20:20:20:20:20:20), VI (30:30:30:30:30:30:30), and VT (40:40:40:40:40:40:40:40:40:40):

```
switch:admin> zone --rdcreate \
    10:10:10:10:10:10:10:10 20:20:20:20:20:20:20:20
    30:30:30:30:30:30:30:30 40:40:40:40:40:40:40:40
    restartable noFCR
```

This command creates the following zone objects:

- RD zone "red_0917_10_10_10_10_10_10_10_20_20_20_20_20_20_20_20", with a restricted policy and no FCR support.
- The base zone object, "red____
- The RD zone configuration, "r_e_d_i_r_c__fg".

To display the newly created zone objects:

```
switch:admin> cfgshow
Defined configuration:
cfg: myHTcfg myHostTarget
       r_e_d_i_r_c__fg
          red____base;
red_0917_00_3f_3f_3f_23_24_25_26_3f_3f_3f_30_32_00_00_00
 zone: myHostTarget
 00:3f:3f:3f:23:24:25:26; 3f:3f:3f:30:32:00:00:00
 zone:red_0917_00_3f_3f_3f_23_24_25_26_3f_3f_3f_30_32_00_00_00
      00:3f:3f:3f:23:24:25:26; 3f:3f:3f:30:32:00:00:00;
      3f:3f:3f:30:30:00:00:00; 3f:3f:3f:30:31:00:00:00
 zone: red___
                __base
       00:00:00:00:00:00:00:01; 00:00:00:00:00:00:00:02;
       00:00:00:00:00:00:00:03; 00:00:00:00:00:00:04
 Effective configuration:
 cfg: myHTcfg
 zone: myHostTarget
               00:3f:3f:3f:23:24:25:26
               3f:3f:3f:30:32:00:00:00
```

To delete an RD Zone named "red_0917_10_10_10_10_10_10_10_10_20_20_20_20_20_20_20_20":

```
switch:admin> zone --rddelete \
     red_0917_10_10_10_10_10_10_10_10_20_20_20_20_20_20_20_20
```

SEE ALSO ad, zoneHelp

zoneAdd

Adds a member to the zone.

SYNOPSIS zoneadd "zoneName", "member[; member]"

DESCRIPTION Use this command to add one or more members to an existing zone.

This command changes the defined configuration. For the change to be preserved across switch reboots, save the configuration to nonvolatile memory with the **cfgSave** command. For the change to become effective, enable the configuration with the **cfgEnable** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS The following operands are required:

"zoneName"

Specify the name of an existing zone. Double quotation marks are optional.

"member"

Specify a member or list of members to be added. The list must be enclosed in double quotation marks. Members must be separated by semicolons. Members can be specified in one or more of the following ways:

- A switch domain and port index number pair; for example, "2, 20". Use switchShow for a listing of valid port index numbers.
- Node or port WWN.
- Zone alias name.

EXAMPLES To add aliases for three disk arrays to "Blue zone":

switch:admin> zoneadd "Blue_Zone", "array3; array4; array5"

SEE ALSO zoneCreate, zoneDelete, zoneRemove, zoneShow

zoneCreate

Creates a zone.

SYNOPSIS

zonecreate "zonename", "member[; member...]"

DESCRIPTION

Use this command to create a new zone, or to create a "broadcast" zone.

A broadcast zone is a special zone that specifies the nodes that can receive broadcast traffic. This zone must be named "broadcast". Only one "broadcast" zone can exist within a fabric. This type of zone is enforced by the hardware; the switch controls the data transfer to a port.

This command changes the defined configuration. For the change to be preserved across switch reboots, save it to nonvolatile memory with the **cfgSave** command. For the change to become effective, enable the zone configuration with the **cfgEnable** command.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS

The following operands are required:

"zonename"

Specify a unique name for the zone to be created. Double quotation marks are optional. A zone name must begin with a letter and followed by any number of letters, numbers, or underscore characters. Names are case-sensitive. For example, "Zone_1" and "zone_1" indicate different zones. Zone names are limited to 64 characters. Spaces are ignored.

"member"

Specify a member or a list of members to be included in the zone. The list must be enclosed in double quotation marks. Members must be separated by semicolons. The list must have at least one member; empty lists are not allowed.

A member can be specified in one or more of the following ways:

- Domain and port index pair: Specify a port by domain and port index, for example, "2, 20" specifies port index 20 on switch domain 2. When a zone member is specified by port index, all devices connected to that port are in the zone. If this port is an arbitrated loop, then all devices on the loop are in the zone. Use switchShow for a list of valid port index numbers.
- World wide name: Specify a world wide name as eight hex numbers separated by colons, for example "10:00:00:60:69:00:00:8a". Zoning compares the WWN with the node and port names presented by a device in a login frame (FLOGI or PLOGI). When a zone member is specified by node name, then all ports on that device are in the zone. When a zone member is specified by port name, then only that single device port is in the zone.
- Zone alias name: Specify a zone alias name using the same format as a zone name. Refer to aliCreate command help for zone alias naming requirements.

When creating a zone, you can combine different ways of specifying zone members. For example, a zone defined with the following members: "2,12; 2,14; 10:00:00:60:69:00:00:8a" contains all devices connected to switch 2, ports 12 and 14, and to the device with the world wide name "10:00:00:60:69:00:00:8a" (either node name or port name), at the port in the fabric to which it is connected.

EXAMPLES

To create three zones using a combination of port numbers and zone aliases:

```
switch:admin> zonecreate "Purple_zone", "1,0"
switch:admin> zonecreate "Blue_zone", "1,1; array1; 1,2; array2"
switch:admin> zonecreate "Green_zone", "1,0; 1,2; array2"
```

SEE ALSO

zoneAdd, zoneDelete, zoneRemove, zoneShow

zoneDelete

Deletes a zone.

SYNOPSIS zonedelete "zonename"

DESCRIPTION Use this command to delete a zone.

> This command changes the defined configuration. For the change to be preserved across switch reboots, save the configuration to nonvolatile memory using the cfgSave command. For the change to

become effective, enable the configuration with the cfgEnable command.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS The following operand is required:

"zonename"

Specify the name of the zone to be deleted. Quotation marks are optional.

EXAMPLES To delete the zone "Blue_zone":

switch:admin> zonedelete "Blue_zone"

SEE ALSO zoneAdd, zoneCreate, zoneRemove, zoneShow

zoneHelp

Displays a description of zoning commands.

SYNOPSIS zonehelp

DESCRIPTION Use this command to display short descriptions of zoning commands.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

OPERANDS None

EXAMPLES To display zone command help information:

switch:admin> zonehelp

aliadd Add a member to a zone alias

SEE ALSO None

zoneObjectCopy

Copies a zone object.

SYNOPSIS

zoneObjectCopy "objectName", "newName"

DESCRIPTION

Use this command to make a copy of an existing zone object and give it a new name. The resulting object is of the same type as the original object. You can use this command for all zone object types, including cfg, zone, and alias.

This command changes the defined configuration. For the change to be preserved across switch reboots, save the configuration to nonvolatile memory with the **cfgSave** command. For the change to become effective, enable the configuration with the **cfgEnable** command.

NOTES

When FCS policy is enabled, this command can be issued only from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operands are required:

"objectName"

The name of the object that you want to copy. Quotation marks are optional.

"newName"

The name of the object that you want created. Quotation marks are optional.

A zone configuration name must begin with a letter followed by any number of letters, numbers, and underscores. Names are case-sensitive. For example, "Cfg_1" and "cfg_1" are different zone configurations. Blank spaces are ignored.

Refer to the zoneCreate command for more information on name and member specifications

EXAMPLES

To create a configuration containing three zones:

```
switch:admin> cfgshow "*"
    cfg: USA_cfg Red_zone; White_zone; Blue_zone
switch:admin> zoneobjectcopy "USA_cfg", "UK_cfg"
switch:admin> cfgshow "*"
    cfg: UK_cfg Red_zone; White_zone; Blue_zone
    cfg: USA_cfg Red_zone; White_zone; Blue_zone
```

SEE ALSO

cfgAdd, cfgClear, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgShow, zoneObjectRename

zoneObjectExpunge

Expunges a zone object.

SYNOPSIS zoneObjectExpunge "objectName"

DESCRIPTION

Use this command to expunge a zone object. In addition to deleting the object, this command also removes the object from the member lists of all other objects. After successful execution of this command, the specified object no longer exists the database. You can use this command for all zone object types, including cfg, zone, and alias.

This command changes the defined configuration. For the change to be preserved across switch reboots, save the configuration to nonvolatile memory with the **cfgSave** command. For the change to become effective, enable the configuration with the **cfgEnable** command.

NOTES

When FCS policy is enabled, this command can be issued only from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

This command has the following operand:

"objectName"

The name of the object that you want to expunge. Quotation marks are optional. This operand is required.

EXAMPLES

To create a configuration containing three zones:

```
switch:admin> cfgshow
   Defined configuration:
    cfg: USA_cfg Red_zone; White_zone; Blue_zone
    zone: Blue_zone
           1,1; array1; 1,2; array2
     zone: Red_zone
           1,0; loop1
     zone: White_zone
           1,3; 1,4
    alias: array1 21:00:00:20:37:0c:76:8c; \
                 21:00:00:20:37:0c:71:02
    alias: array2 21:00:00:20:37:0c:76:22; \
                21:00:00:20:37:0c:76:28
    alias: loop1 21:00:00:20:37:0c:76:85; \
                 21:00:00:20:37:0c:71:df
switch:admin> zoneobjectexpunge "White_zone"
switch:admin> cfgshow
   Defined configuration:
    cfg: USA_cfg
                      Red_zone; Blue_zone
    zone: Blue_zone
           1,1; array1; 1,2; array2
    zone: Red_zone
           1,0; loop1
    alias: array1 21:00:00:20:37:0c:76:8c; \
```

```
21:00:00:20:37:0c:71:02
alias: array2 21:00:00:20:37:0c:76:22; \
              21:00:00:20:37:0c:76:28
alias: loop1
              21:00:00:20:37:0c:76:85; \
              21:00:00:20:37:0c:71:df
```

SEE ALSO

cfgAdd, cfgClear, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgShow, zoneObjectCopy, zoneObjectRename

zoneObjectRename

Renames a zone object.

SYNOPSIS zoneObje

zoneObjectRename "objectName", "newName"

DESCRIPTION

Use this command to rename a zone object. You can use this command for all zone object types, including cfg, zone, and alias.

This command changes the defined configuration. For the change to be preserved across switch reboots, save the configuration to nonvolatile memory with the **cfgSave** command. For the change to become effective, enable the configuration must be enabled with the **cfgEnable** command.

NOTES

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

OPERANDS

The following operands are required:

"objectName"

The name of the object you want to rename.

"newName"

The new name of the object.

A zone configuration name must begin with a letter that can be followed by any number of letters, numbers, and underscores. Names are case-sensitive. For example, "Cfg_1" and "cfg_1" are different zone configurations. Quotation marks are optional. Spaces are ignored.

Refer to the zoneCreate command for more information on name and member specifications.

EXAMPLES

To create a configuration containing three zones:

```
switch:admin> cfgshow "*"
    cfg: USA_cfg Red_zone; White_zone; Blue_zone
switch:admin> zoneobjectrename "USA_cfg", "UK_cfg"
switch:admin> cfgshow "*"
    cfg: UK_cfg Red_zone; White_zone; Blue_zone
```

SEE ALSO

cfgAdd, cfgClear, cfgDelete, cfgDisable, cfgEnable, cfgRemove, cfgSave, cfgShow, zoneObjectCopy

zoneRemove

Removes a member from a zone.

SYNOPSIS zoneremove "zonename", "zoneMemberList"

DESCRIPTION Use this command to remove one or more members from an existing zone.

If all members are removed, the zone is deleted.

This command changes the defined configuration. For the change to be preserved across switch reboots, save the configuration to nonvolatile memory with the cfgSave command. For the change to become effective, enable the configuration with the **cfgEnable** command.

NOTES The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in

place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for

details.

When an FCS policy is enabled, this command can be issued only from the primary FCS switch.

OPERANDS The following operands are required:

"zonename"

Specify the name of the zone from which to remove a member. Double quotation marks are optional.

"zoneMemberList"

Specify a member or a list of members to be removed from the specified zone. The list must be enclosed in double quotation marks. Members must be separated by semicolons. A member can be one or more of the following:

- A switch domain and port index pair: for example, "2,20". Use switchShow for a list of valid port index numbers.
- A world wide name
- A zone alias name

To remove "array2" from "Blue_zone": **EXAMPLES**

switch:admin> zoneremove "Blue_zone", "array2"

SEE ALSO zoneAdd, zoneCreate, zoneDelete, zoneShow

zoneShow

Displays zone information.

SYNOPSIS

zoneshow [--sort] [pattern][, mode]

zoneshow --help

DESCRIPTION

Use this command to display zone configuration information. This command includes sorting and search options to customize the output. If a pattern is specified, the command displays only matching match zone configuration names in the defined configuration. When used without operands, the command displays all zone configuration information for the Defined and the Effective configuration. Refer to **cfgShow** for a description of this display.

NOTES

The execution of this command is subject to Virtual Fabric or Admin Domain restrictions that may be in place. Refer to Chapter 1, "Using Fabric OS Commands" and Appendix A, "Command Availability" for details.

When FCS policy is enabled, this command can be issued on any FCS switch in the fabric.

OPERANDS

This command has the following operands:

--sort

Displays D,I zone members in ascending order.

pattern

A POSIX-style regular expression used to match zone configuration names. This operand is optional. Patterns can contain:

- A question mark (?) to match any single character.
- An asterisk (*) to match any string of characters.
- A range of characters to match any character within the range: for example, [0-9] or [a-f].

mode

Specify 0 to display the contents of the transaction buffer (the contents of the current transaction), or specify 1 to display the contents of the nonvolatile memory. The default value is 0. This operand is optional.

--help

Displays the command usage.

EXAMPLES To display all zones:

To sort the zones in ascending order:

```
switch:admin> zoneShow --sort
     Defined configuration:
        cfg: cfg1 red
        zone: blue 10:00:00:00:00:01:00:00; 3,4; 44,5
        zone: red 1,2; 2,3; 3,4; 4,5
     Effective configuration:
        cfg: cfg1
        zone: red 1,2
                    2,3
                    3,4
                    4,5
```

To display the red zone only using pattern search:

```
switch:admin> zoneshow red
zone: red 3,4; 1,2; 4,5; 2,3
```

To combine a pattern search with the sorting option:

```
switch:admin> zoneshow --sort red
        zone: red 1,2; 2,3; 3,4; 4,5
```

To display the filtered content of the transaction buffer:

```
switch:admin> zoneshow red, 1
                zone: red 3,4; 1,2; 4,5; 2,3
```

To display the filtered and sorted content of the transaction buffer:

```
switch:admin> zoneshow --sort red, 1
        zone: red 1,2; 2,3; 3,4; 4,5
```

SEE ALSO zoneAdd, zoneCreate, zoneDelete, zoneRemove

Primary FCS Commands

In this chapter

Primary FCS commands

Table 6 summarizes the commands that are available only on the primary Fabric Configuration Server (FCS) when FCS policy is enabled.

TABLE 6 Primary FO	CS commands
Command	Description
aliAdd	Must be run from the primary FCS switch.
aliCreate	Must be run from the primary FCS switch.
aliDelete	Must be run from the primary FCS switch.
aliRemove	Must be run from the primary FCS switch.
aliShow	Can be run on all FCS switches.
cfgAdd	Must be run from the primary FCS switch.
cfgClear	Must be run from the primary FCS switch.
cfgCreate	Must be run from the primary FCS switch.
cfgDelete	Must be run from the primary FCS switch.
cfgDisable	Must be run from the primary FCS switch.
cfgEnable	Must be run from the primary FCS switch.
cfgRemove	Must be run from the primary FCS switch.
cfgSave	Must be run from the primary FCS switch.
cfgShow	Can be run on all FCS switches.
cfgSize	Must be run from the primary FCS switch.
cfgTransAbort	Must be run from the primary FCS switch.
cfgTransShow	Must be run from the primary FCS switch.
date	This command can be run on all switches to view the current date. You can only modify the date from the primary FCS switch.
defZone	defzone show can be run on all switches. All other options must be run from the primary FCS switch.
msPlClearDB	Must be run from the primary FCS switch.
msPIMgmtActivate	Must be run from the primary FCS switch.
msPIMgmtDeactivate	Must be run from the primary FCS switch.

TABLE 6 Primary FCS commands (Continued)

Command	Description
msTdDisable	msTdDisable "ALL" must be run from the primary FCS switch.
msTdEnable	msTdEnable "ALL" must be run from the primary FCS switch.
secPolicyAbort	Must be run from the primary FCS switch.
secPolicyActivate	Must be run from the primary FCS switch.
secPolicyAdd	Must be run from the primary FCS switch.
secPolicyCreate	Must be run from the primary FCS switch.
secPolicyDelete	Must be run from the primary FCS switch.
secPolicyDump	Can be run on all FCS switches.
secPolicyFCSMove	Must be run from the primary FCS switch.
secPolicyRemove	Must be run from the primary FCS switch.
secPolicySave	Must be run from the primary FCS switch.
secPolicyShow	Can be run on all FCS switches.
snmpConfig	Can be run on all FCS switches.
tsClockServer	Can be run on all switches to view the NTP server's IP address. You can only modify the NTP server's IP address on the primary FCS switch.
zoneAdd	Must be run from the primary FCS switch.
zoneCreate	Must be run from the primary FCS switch.
zoneDelete	Must be run from the primary FCS switch.
zoneObjectCopy	Must be run from the primary FCS switch.
zoneObjectExpung	Must be run from the primary FCS switch.
zoneObjectRename	Must be run from the primary FCS switch.
zoneRemove	Must be run from the primary FCS switch.

Command Availability

A

In this appendix

•	Command validation checks	1089
•	Encryption commands and permissions	1090
•	General Fabric OS commands and permissions	1093

Command validation checks

Before a command is executed, it is validated against the following checks.

- Active or Standby availability: On enterprise-class platforms systems, checks that the command is available on the Control Processor (CP).
- 2. Role-Based Access Control (RBAC) availability: Checks that the invoking user's role is permitted to invoke the command. If the command modifies system state, the user's role must have modify permission for the command. If the command only displays system state, the user's role must have observe permission for the command. Some commands both observe and modify system state and thus require observe-modify permission. The following RBAC permissions are supported:
 - O = Observe
 - OM = Observe-modify,
 - N = None or not available
- 3. Admin Domain availability: If Admin Domains are enabled, the system checks that the command is allowed in the currently selected Admin Domain. For information on Admin Domain concepts and restrictions, refer to the *Fabric OS Administrator's Guide*.

Admin Domain types are one or more of the following. If more than one AD type is listed for a command, the AD type is option- specific. Display options may be allowed, but set options may be subject to Admin Domain restrictions.

- SwitchMember = Allowed to execute only if the local switch is part of the current AD.
- Allowed = Allowed to execute in all ADs.
- PhysFabricOnly = Allowed to execute only in AD255 context (and the user should own access to AD0-AD255 and have admin RBAC privilege).
- Disallowed = Allowed to execute onlyin AD0 or AD255 context; not allowed in AD1-AD254 context.
- PortMember = All control operations allowed only if the port or the local switch is part of the current AD. View access allowed if the device attached to the port is part of the current AD.
- AD0Disallowed = Allowed to execute only in AD255 and AD0 (if no ADs are configured).
- AD0Only = Allowed to execute only in AD0 when ADs are not configured.
- 4. Virtual Fabric availability: If Virtual Fabrics are enabled, commands are checked for context and switch type as follows:
 - Virtual Fabric context (VF) = Command applies to the current logical switch only, or to a specified logical switch.

Virtual Fabric commands are further constrained by one of the following switch types:

- All Switches (All) = Command can be run in any switch context.
- Base Switch (BS) = Command can be run only on the base switch.
- Default Switch (DS) = Command can be run only on the default switch.
- N/A = Switch type is not applicable to the command.
- Chassis context (CH) = Command applies to the chassis on which it is executed.
- Switch and Chassis context (VF/CH) = Command applies to the switch and the chassis.
- Disallowed = Command cannot be executed when Virtual Fabrics are enabled.
- Command-specific: Checks whether the command is supported on the platform for which it is targeted.

Encryption commands and permissions

There are two system RBAC roles that are permitted to perform encryption operations.

Admin and SecurityAdmin

Users authenticated with the Admin and SecurityAdmin RBAC roles may perform cryptographic functions assigned to the FIPS Crypto Officer, including the following:

- Perform encryption node initialization.
- Enable cryptographic operations.
- Manage critical security parameters (CSPs) input and output functions.
- Zeroize encryption CSPs.
- Register and configure a key vault.
- Configure a recovery share policy.
- Create and register recovery share.
- Encryption group- and clustering-related operations.
- Manage keys, including creation, recovery, and archiving functions.
- Admin and FabricAdmin

Users authenticated with the Admin and FabricAdmin RBAC roles may perform routine encryption switch management functions including the following:

- Configure virtual devices and crypto LUN.
- Configure LUN/tape associations.
- Perform re-keying operations.
- Perform firmware download.
- Perform regular Fabric OS management functions.

Refer to Table 7 for the RBAC permissions of the encryption configuration commands. The commands listed in this table are subcommands to the **cryptoCfg** command.

TABLE 7 Encryption command RBAC availability and Admin Domain type

General Fabric OS commands and permissions

Refer to Table 8 for Fabric OS commands.

NOTE

For some commands, permissions per operands may be different from general access permissions. Use the **classConfig –showcli** command to display permission details for a specified command
